

ROCKSWOLD

PRECALCULUS

with Modeling & Visualization

CUSTOM EDITION FOR PORTLAND STATE UNIVERSITY

MTH 111

Showing Why Math Matters

Gary Rockswold teaches algebra in context, answering the question,
“Why am I learning this?”

Going green

Many activities, such as driving a car, watching television, riding a jet ski, or flying in an airplane, emit carbon dioxide into the air. A commercial airliner, for example, emits 150 pounds of carbon dioxide for each passenger who flies 240 miles. Understanding our environmental impact on the planet is becoming increasingly important. Functions can be used to model and predict carbon emissions. (See the Chapter 2 opener on page 76 and Example 4 from Section 2.1 on page 81.)

How many songs will my iPod hold?

The number of songs that will fit on your iPod depends on the size of its memory. We can use the concept of slope to analyze memory requirements for storing music on iPods. (See Example 2 from Section 1.4 on page 49 to learn more.)

Determining sunset times

Whether we are traveling cross-country, driving a boat on a lake, or designing a solar power plant, the time of sunset can be important. If we know the sunset time on two different days, can we make predictions about sunset times on other days? Using a linear function, we can often make accurate estimates. (See Example 7 from Section 2.4 on page 139.)

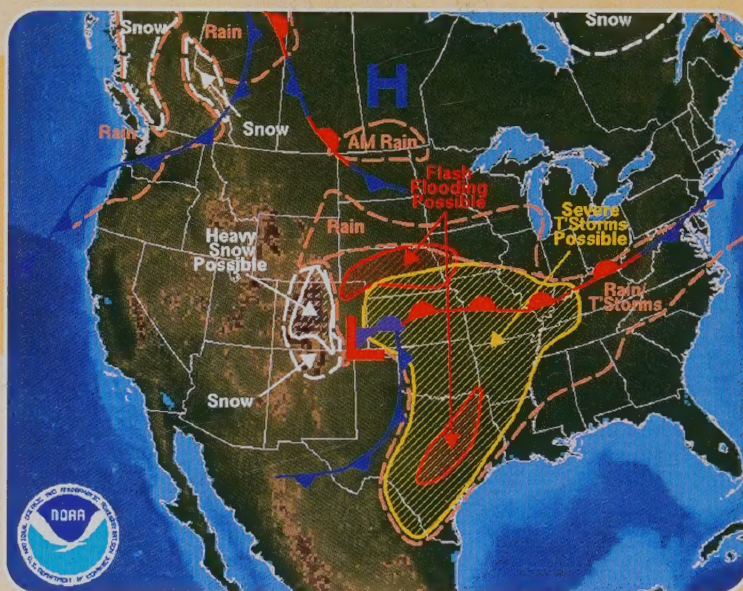

Shooting free throws

Is it better to shoot a free throw overhand or underhand? Mathematics can be used to improve an athlete's performance. Learn how parabolas, the angle of release, and the velocity of the basketball all play a role in determining whether the ball goes through the hoop. (See the Chapter 3 opener on page 169 to learn more.)

Modeling movement of weather

How do meteorologists know where a cold front will be tomorrow? How do they know that one city will be hit by a blizzard, and a city 100 miles away will get only flurries? Scientists model weather systems and make predictions by translating and transforming graphs on a weather map. (Learn more in Section 3.5 on pages 222 and 238.)

Waiting in line

Have you ever noticed how a slight increase in the number of cars exiting a parking garage or trying to get through a construction zone can make your wait much longer? These long lines of waiting cars are subject to a nonlinear effect. To make predictions about traffic congestion, highway engineers often use rational functions. (See the application and Example 2 in Section 4.6 on page 309 to learn more.)

Contents

*In memory of my Uncle Jerry,
who passed before his time*

Contents

Preface *xiv*

1 Introduction to Functions and Graphs *1*

1.1 Numbers, Data, and Problem Solving *2*

Sets of Numbers ■ Order of Operations ■ Scientific Notation ■ Problem Solving

1.2 Visualizing and Graphing Data *12*

One-Variable Data ■ Two-Variable Data ■ The Distance Formula ■ The Midpoint Formula ■ Circles ■ Graphing with a Calculator (Optional)

Checking Basic Concepts for Sections 1.1 and 1.2 *28*

1.3 Functions and Their Representations *28*

Basic Concepts ■ Representations of Functions ■ Formal Definition of a Function ■ Graphing Calculators and Functions (Optional) ■ Identifying Functions ■ Functions Represented by Diagrams and Equations

1.4 Types of Functions *45*

Constant Functions ■ Linear Functions ■ Slope as a Rate of Change ■ Nonlinear Functions

Checking Basic Concepts for Sections 1.3 and 1.4 *55*

1.5 Functions and Their Rates of Change *56*

Increasing and Decreasing Functions ■ Interval Notation ■ Average Rate of Change ■ The Difference Quotient

Checking Basic Concepts for Section 1.5 *67*

Chapter 1 Summary *67*

Chapter 1 Review Exercises *71*

Chapter 1 Extended and Discovery Exercises *74*

2 Linear Functions and Equations *76*

2.1 Linear Functions and Models *77*

Functions as Models ■ Representations of Linear Functions ■ Modeling with Linear Functions ■ Piecewise-Defined Functions ■ The Greatest Integer Function ■ Linear Regression (Optional)

2.2 Equations of Lines 96

Forms for Equations of Lines ■ Finding Intercepts ■ Horizontal, Vertical, Parallel, and Perpendicular Lines ■ Modeling Data (Optional) ■ Direct Variation

Checking Basic Concepts for Sections 2.1 and 2.2 113

2.3 Linear Equations 113

Equations ■ Symbolic Solutions ■ Graphical and Numerical Solutions ■ Solving for a Variable ■ Problem-Solving Strategies

2.4 Linear Inequalities 132

Inequalities ■ Compound Inequalities

Checking Basic Concepts for Sections 2.3 and 2.4 146

2.5 Absolute Value Equations and Inequalities 146

The Absolute Value Function ■ Absolute Value Equations ■ Absolute Value Inequalities

Checking Basic Concepts for Section 2.5 157

Chapter 2 Summary 157

Chapter 2 Review Exercises 161

Chapter 2 Extended and Discovery Exercises 164

Chapters 1–2 Cumulative Review Exercises 165

3 Quadratic Functions and Equations 169**3.1 Quadratic Functions and Models** 170

Basic Concepts ■ Completing the Square and the Vertex Formula ■ Applications and Models ■ Quadratic Regression (Optional)

3.2 Quadratic Equations and Problem Solving 188

Quadratic Equations ■ Factoring ■ The Square Root Property ■ Completing the Square ■ The Quadratic Formula ■ The Discriminant ■ Problem Solving

Checking Basic Concepts for Sections 3.1 and 3.2 204

3.3 Complex Numbers 205

Basic Concepts ■ Arithmetic Operations on Complex Numbers ■ Quadratic Equations with Complex Solutions

3.4 Quadratic Inequalities 212

Basic Concepts ■ Graphical and Numerical Solutions ■ Symbolic Solutions

Checking Basic Concepts for Sections 3.3 and 3.4 221

3.5 Transformations of Graphs 222

Vertical and Horizontal Shifts ■ Stretching and Shrinking ■ Reflection of Graphs ■ Combining Transformations ■ Modeling with Transformations (Optional)

<i>Checking Basic Concepts for Section 3.5</i>	239
<i>Chapter 3 Summary</i>	240
<i>Chapter 3 Review Exercises</i>	244
<i>Chapter 3 Extended and Discovery Exercises</i>	246

4**More Nonlinear Functions and Equations 248**

4.1 More Nonlinear Functions and Their Graphs 249

Polynomial Functions ■ Identifying Extrema ■ Symmetry

4.2 Polynomial Functions and Models 261

Graphs of Polynomial Functions ■ Piecewise-Defined Polynomial Functions ■ Polynomial Regression (Optional)

Checking Basic Concepts for Sections 4.1 and 4.2 276

4.3 Division of Polynomials 277

Division by Monomials ■ Division by Polynomials ■ Synthetic Division

4.4 Real Zeros of Polynomial Functions 285

Factoring Polynomials ■ Graphs and Multiple Zeros ■ Rational Zeros (Optional) ■ Descartes' Rule of Signs (Optional) ■ Polynomial Equations ■ Intermediate Value Property (Optional)

Checking Basic Concepts for Sections 4.3 and 4.4 301

4.5 The Fundamental Theorem of Algebra 302

Fundamental Theorem of Algebra ■ Polynomial Equations with Complex Solutions

4.6 Rational Functions and Models 308

Rational Functions ■ Vertical Asymptotes ■ Horizontal Asymptotes ■ Identifying Asymptotes ■ Graphs and Transformations of Rational Functions ■ Graphing Rational Functions by Hand (Optional)

Checking Basic Concepts for Sections 4.5 and 4.6 323

4.7 More Equations and Inequalities 323

Rational Equations ■ Variation ■ Polynomial Inequalities ■ Rational Inequalities

4.8 Radical Equations and Power Functions 340

Rational Exponents and Radical Notation ■ Equations Involving Radicals ■ Power Functions and Models ■ Equations Involving Rational Exponents ■ Power Regression (Optional)

Checking Basic Concepts for Sections 4.7 and 4.8 353

Chapter 4 Summary 354

Chapter 4 Review Exercises 358

Chapter 4 Extended and Discovery Exercises 362

Chapters 1–4 Cumulative Review Exercises 363

5

Exponential and Logarithmic Functions 367

5.1 Combining Functions 368

Arithmetic Operations on Functions ■ Review of Function Notation ■
Composition of Functions

5.2 Inverse Functions and Their Representations 385

Inverse Operations and Inverse Functions ■ One-to-One Functions ■
Symbolic Representations of Inverse Functions ■ Other Representations of
Inverse Functions

Checking Basic Concepts for Sections 5.1 and 5.2 401

5.3 Exponential Functions and Models 402

Linear and Exponential Growth ■ Exponential Growth and Decay ■
Compound Interest ■ The Natural Exponential Function ■ Exponential Models

5.4 Logarithmic Functions and Models 421

The Common Logarithmic Function ■ Logarithms with Other Bases ■ Basic
Equations ■ General Equations

Checking Basic Concepts for Sections 5.3 and 5.4 437

5.5 Properties of Logarithms 438

Basic Properties of Logarithms ■ Expanding and Combining Logarithmic
Expressions ■ Change of Base Formula

5.6 Exponential and Logarithmic Equations 447

Exponential Equations ■ Logarithmic Equations

Checking Basic Concepts for Sections 5.5 and 5.6 460

5.7 Constructing Nonlinear Models 460

Exponential Model ■ Logarithmic Model ■ Logistic Model ■
Selecting a Model

Checking Basic Concepts for Section 5.7 469

Chapter 5 Summary 469

Chapter 5 Review Exercises 473

Chapter 5 Extended and Discovery Exercises 476

R

Reference: Basic Concepts from Algebra and Geometry R-1

R.1 Formulas from Geometry R-1

Geometric Shapes in a Plane ■ The Pythagorean Theorem ■
Three-Dimensional Objects ■ Similar Triangles

R.2 Integer Exponents R-7

Bases and Positive Exponents ■ Zero and Negative Exponents ■
Product, Quotient, and Power Rules

R.3 Polynomial Expressions *R-13*

Addition and Subtraction of Monomials ■ Addition and Subtraction of Polynomials ■ Distributive Properties ■ Multiplying Polynomials ■ Some Special Products

R.4 Factoring Polynomials *R-20*

Common Factors ■ Factoring by Grouping ■ Factoring $x^2 + bx + c$ ■ Factoring Trinomials by Grouping ■ Factoring Trinomials with FOIL ■ Difference of Two Squares ■ Perfect Square Trinomials ■ Sum and Difference of Two Cubes

R.5 Rational Expressions *R-30*

Simplifying Rational Expressions ■ Review of Multiplication and Division of Fractions ■ Multiplication and Division of Rational Expressions ■ Least Common Multiples and Denominators ■ Review of Addition and Subtraction of Fractions ■ Addition and Subtraction of Rational Expressions ■ Clearing Fractions ■ Complex Fractions

R.6 Radical Notation and Rational Exponents *R-40*

Radical Notation ■ Rational Exponents ■ Properties of Rational Exponents

R.7 Radical Expressions *R-45*

Product Rule for Radical Expressions ■ Quotient Rule for Radical Expressions ■ Addition and Subtraction ■ Multiplication ■ Rationalizing the Denominator

Preface

This textbook offers an innovative approach that consistently links mathematical concepts to real-world applications by moving from the concrete to the abstract. It demonstrates the relevance of mathematics and answers the question, “When will I ever need to know this?” This text provides a comprehensive curriculum with the balance and flexibility necessary for today’s college mathematics courses. The early introduction of functions and graphs allows the instructor to use applications and visualization to present mathematical topics. Real data, graphs, and tables play an important role in the course, giving meaning to the numbers and equations that students encounter. This approach increases students’ interest and motivation and their likelihood of success.

The vast majority of students who study mathematics in college will not become professional mathematicians. Because the importance of mathematics and its applications is accelerating rapidly, however, essentially all of these students will use mathematics during their lifetimes to a much greater extent than they might anticipate. Mathematics courses must prepare students with a variety of skills and the understanding needed to be productive and informed members of society.

Approach

Instructors are free to strike their own balance of skills, rule of four, applications, modeling, and technology. With a flexible approach to the rule of four (verbal, graphical, numerical, and symbolic methods), instructors can easily emphasize one rule more than another to meet their students’ needs. This approach also extends to modeling and applications. The use of technology, which helps students visualize mathematical concepts, is *optional* and not a requirement for students to benefit from this approach. Nevertheless, the text still provides a strong option for instructors who wish to implement graphing calculator technology. The text contains numerous applications, including models of real-world data with functions and problem-solving strategies. It is not necessary for an instructor to discuss any particular application; rather, an instructor has the option to choose from a wide variety of topics.

The concept of a function is the unifying theme of the text. It is common for students to examine a type of function and its graph and then use this knowledge to solve associated equations and inequalities. For example, students apply their knowledge of quadratic functions and parabolas to solve quadratic equations and inequalities. This visual approach complements the traditional symbolic approach to solving equations and inequalities and allows students to solve a problem by using more than one method. Functions and their graphs are frequently used to solve applications and model real-world data, and students are often asked to interpret their results. Mathematical skills also play an important role in this text. Numerous exercises have been included so that students can practice their skills.

When students arrive in a college-level mathematics class, they often lack a full mastery of intermediate algebra. Rather than reviewing all of the necessary intermediate algebra skills in the first chapter in hopes that “saying it louder and faster” will help students remember it better, this book integrates them seamlessly throughout the early chapters. In addition, review notes and geometry notes appearing in the margins refer students “just in time” to extra help found in Chapter R: Basic Concepts from Algebra and Geometry.

Content Changes to the Fourth Edition

The fourth edition contains several important changes, which are the result of the many comments and suggestions made by instructors, students, and reviewers. This text contains eleven chapters plus a review chapter at the end of the text. The breadth and depth of several topics have been increased. Some highlights of this revision include the following:

- Hundreds of examples and exercises have been added and revised.
- Several new chapter and section openers have been written using current data to increase student interest.
- Arrows have been added to graphs whenever appropriate.
- Calculator graphs have a new, smooth look, and equation labels have been added to make these graphs easier to read.
- Greater use has been made of headings and subheadings to add clarity to the text.
- Each exercise set has been carefully revised to ensure that there are sufficient exercises of various types for each example and mathematical concept. Exercise sets are carefully graded with several levels of difficulty.
- Real-world data have been updated or added to make the text more current.
- Chapter 1 has been expanded from four sections to five. Increasing and decreasing functions, average rates of change, and difference quotients are now discussed in Section 1.5. Circles now appear in Section 1.2 instead of Chapter R.
- In Chapter 2, piecewise-linear functions are now discussed earlier, in Section 2.1.
- Complex numbers have been moved to Chapter 3 as a new section.
- Chapter 4 has been expanded and reorganized from seven to eight sections, making it easier to cover one section per class. Division of polynomials and real zeros of polynomial functions are now in separate sections. Coverage of several topics, such as rational functions, has been revised and enhanced.
- In Chapter 5, the change of base formula is now presented in Section 5.4 and additional modeling has been included in Section 5.7.
- In Chapter 6 a unit circle approach that uses the wrapping function has been included.
- Chapter 7 has more explanation and exercises related to solving trigonometric equations.
- In Chapter 8 additional explanation of the ambiguous case for law of sines has been added. There also is more explanation of position vectors, components, and direction angles.
- Chapter 9 has been reorganized so that systems of equations are discussed in Section 9.1 and systems of inequalities and linear programming are discussed in Section 9.2. Substitution and elimination are both presented in Section 9.1.
- Chapter R includes additional problems involving factoring and rational expressions.
- Discussion of the following important topics has been added or enhanced:

Order of operations	Graphing rational functions by hand
Rational functions and expressions	Concavity
Factoring	Vectors
Interpolation and extrapolation	Wrapping function
Modeling real data	

Features

Chapter and Section Introductions

Many college algebra students have little or no understanding of mathematics beyond basic computation. To motivate students, chapter and section introductions explain some of the reasons for studying mathematics. (See pages 1, 76, 146, and 249.)

NEW!**Now Try**

This feature occurs after each example. It suggests a similar exercise students can work to see if they understand the concept presented in the example. (See pages 5, 115, and 189.)

Getting Started

This new feature occurs in selected examples that require multistep solutions. Getting Started helps students develop an overall problem-solving strategy before they begin writing a detailed solution. (See pages 6, 98, and 225.)

Algebra and Geometry Review Notes

Throughout the text, Algebra and Geometry Review Notes, located in the margins, direct students “just in time” to Chapter R, where important topics in algebra and geometry are reviewed. Instructors can use this chapter for extra review or refer students to it as needed. This feature *frees* instructors from having to frequently review material from intermediate algebra and geometry. (See pages 124 and 174.)

Calculator Help Notes

The Calculator Help Notes in the margins direct students “just in time” to Appendix A: Using the Graphing Calculator. This appendix shows students the keystrokes necessary to complete specific examples from the text. This feature *frees* instructors from having to teach the specifics of the graphing calculator and gives students a convenient reference written specifically for this text. (See pages 6, 22, and 119.)

Class Discussion

This feature, included in most sections, poses a question that can be used for either classroom discussion or homework. (See pages 33, 50, and 253.)

Making Connections

This feature, which occurs throughout the text, shows students how concepts covered previously are related to new concepts being presented. (See pages 31, 32, 226, and 286.)

Putting It All Together

This helpful feature at the end of each section summarizes techniques and reinforces the mathematical concepts presented in the section. It is given in an easy-to-follow grid. (See pages 125–126, 348–349, and 394–396.)

Checking Basic Concepts

This feature, included after every two sections, provides a small set of exercises that can be used for review. These exercises require about 15 or 20 minutes to complete and can be used for collaborative learning exercises if time permits. (See pages 113, 204, and 276–277.)

Exercise Sets

The exercise sets are the heart of any mathematics text, and this text includes a large variety of instructive exercises. Each set of exercises covers skill building, mathematical concepts, and applications. Graphical interpretation and tables of data are often used to extend students’ understanding of mathematical concepts. The exercise sets are graded carefully and categorized according to topic, making it easy for an instructor to select appropriate assignments. (See pages 107–113 and 200–204.)

Chapter Summaries

Chapter summaries are presented in an easy-to-read grid. They allow students to quickly review key concepts from the chapter. (See pages 240–243 and 354–358.)

Chapter Review Exercises

This exercise set contains both skill-building and applied exercises. These exercises stress different techniques for solving problems and provide students with the review necessary to pass a chapter test. (See pages 71–74 and 358–361).

■ Extended and Discovery Exercises

Extended and Discovery Exercises occur at the end of selected sections and at the end of every chapter. These exercises are usually more complex and challenging than the rest of the exercises and often require extension of a topic presented or exploration of a new topic. They can be used for either collaborative learning or extra homework assignments. (See pages 74–75, 246–247, and 362.)

■ Cumulative Review Exercises

These comprehensive exercise sets, which usually occur after every two chapters, allow students to review previous material. (See pages 165–168 and 363–366.)

Instructor Supplements

ANNOTATED INSTRUCTOR'S EDITION

- A special edition of the text
- Includes new Teaching Examples, an extra set of examples for instructors to present in class, doubling the number of examples available for instructors
- Includes new Teaching Tips, helpful ideas about presenting topics or teaching from the text
- Includes all of the answers to the exercise sets, usually right on the page where the exercise appears

ISBN: 0-321-56509-6 / 978-0-321-56509-9

INSTRUCTOR'S SOLUTIONS MANUAL

- By David Atwood and Terry Krieger, *Rochester Community and Technical College*
- Provides complete solutions to all text exercises, excluding Writing about Mathematics

ISBN: 0-321-57710-8 / 978-0-321-57710-8

INSTRUCTOR'S TESTING MANUAL (DOWNLOAD ONLY)

- By Vincent McGarry, *Austin Community College*
- Provides prepared tests for each chapter of the text, as well as answers
- Available for download at www.pearsonhighered.com/irc
- An access code is required.

TESTGEN® (DOWNLOAD ONLY)

- Enables instructors to build, edit, print, and administer tests using a computerized bank of questions that cover all the objectives of the text
- Using algorithmically based questions, allows instructors to create multiple but equivalent versions of the same question or test with the click of a button

- Lets instructors modify test bank questions or add new questions
- Provides printable or online tests
- Available for download from Pearson Education's online catalog (www.pearsonhighered.com/irc)
- An access code is required.

INSIDER'S GUIDE

- Includes resources to help faculty with course preparation and classroom management
- Provides helpful teaching tips correlated to the sections of text, as well as general teaching advice

ISBN: 0-321-57717-5 / 978-0-321-57717-7

POWERPOINT PRESENTATION (DOWNLOAD ONLY)

- Classroom presentation software correlated specifically to this textbook sequence
- Available for download within MyMathLab or at www.pearsonhighered.com/irc
- An access code is required.

PEARSON MATH ADJUNCT SUPPORT CENTER

The **Pearson Math Adjunct Support Center** (www.pearson tutorservices.com/math-adjunct.html) is staffed by qualified instructors with more than 50 years of combined experience at both the community college and the university level. Assistance is provided for faculty in the following areas:

- Suggested syllabus consultation
- Tips on using materials packed with your book
- Book-specific content assistance
- Teaching suggestions, including advice on classroom strategies

Student Supplements

STUDENT'S SOLUTIONS MANUAL

- By David Atwood and Terry Krieger, *Rochester Community and Technical College*
- Provides complete solutions to all odd-numbered text exercises, excluding Writing about Mathematics and Extended and Discovery Exercises

ISBN: 0-321-57709-4 / 978-0-321-57709-2

VIDEOS ON DVD WITH OPTIONAL SUBTITLES

- DVD format enables students to watch the videos at home or on campus

- Affordable and portable for students
 - Ideal for distance learning or supplemental instruction
 - Include optional subtitles in English and Spanish
- ISBN: 0-321-57715-9 / 978-0-321-57715-3

A REVIEW OF ALGEBRA

- By Heidi Howard, *Florida Community College at Jacksonville*
- Provides additional support for those students needing further algebra review

ISBN: 0-201-77347-3 / 978-0-201-77347-7

Technology Resources

MathXL®

MathXL is a powerful online homework, tutorial, and assessment system that accompanies Pearson Education's textbooks in mathematics or statistics. With MathXL, instructors can create, edit, and assign online homework and tests, using algorithmically generated exercises correlated at the objective level to the textbook. They can also create and assign their own online exercises and import TestGen tests for added flexibility. All student work is tracked in MathXL's online gradebook. Students can take chapter tests in MathXL and receive personalized study plans based on their test results. The study plan diagnoses weaknesses and links students directly to tutorial exercises for the objectives they need to study and retest. Students can also access supplemental animations and video clips directly from selected exercises. MathXL is available to qualified adopters. For more information, visit our Web site at www.mathxl.com or contact your sales representative.

MyMathLab®

MyMathLab is a series of text-specific, easily customizable online courses for Pearson Education's textbooks in mathematics and statistics. Powered by CourseCompass™ (our online teaching and learning environment) and MathXL® (our online homework, tutorial, and assessment system), MyMathLab gives you the tools you need to deliver all or a portion of your course online, whether your students are in a lab setting or working from home. MyMathLab provides a rich and flexible set of course materials, featuring free-response exercises that are algorithmically generated for unlimited practice and mastery. Students can also use online tools, such as video lectures, animations, and a multimedia textbook, to independently improve their understanding and performance. Instructors can use MyMathLab's homework and test managers to select and assign online exercises correlated directly to the textbook, and they can also create and assign their own online exercises and import TestGen tests for added flexibility. MyMathLab's online gradebook—designed specifically for mathematics and statistics—automatically tracks students' homework and test results and gives the instructor control over how

to calculate final grades. Instructors can also add offline (paper-and-pencil) grades to the gradebook. MyMathLab also includes access to the **Pearson Tutor Center** (www.pearson tutorservices.com). The Tutor Center is staffed by qualified mathematics instructors who provide textbook-specific tutoring for students via toll-free phone, fax, email, and interactive Web sessions. MyMathLab is available to qualified adopters. For more information, visit our Web site at www.mymathlab.com or contact your sales representative.

MathXL[®] Tutorials on CD ISBN 0-321-57707-8 / 978-0-321-57707-8

This interactive tutorial CD-ROM provides algorithmically generated practice exercises that are correlated at the objective level to the exercises in the textbook. Every practice exercise is accompanied by an example and a guided solution designed to involve students in the solution process. Selected exercises may also include a video clip to help students visualize concepts. The software provides helpful feedback for incorrect answers and can generate printed summaries of students' progress.

InterAct Math Tutorial Web Site: www.interactmath.com

Get practice and tutorial help online! This interactive tutorial website provides algorithmically generated practice exercises that correlate directly to the exercises in the textbook. Students can retry an exercise as many times as they like, with new values each time, for unlimited practice and mastery. Every exercise is accompanied by an interactive guided solution that provides helpful feedback for incorrect answers, and students can also view a worked-out sample problem that steps them through an exercise similar to the one they're working on.

Acknowledgments

Many individuals contributed to the development of this textbook. I would like to thank the following reviewers, whose comments and suggestions were invaluable in preparing this and previous editions of the text.

A special thank you is due Terry Krieger at Rochester Community and Technical College for his exceptional work with the manuscript and answers. I would also like to thank Paul Lorczak, Christine Nguyen, Marcia Nermoe, Kathleen Pellissier, and David Atwood at Rochester Community and Technical College and Janis Cimperman at St. Cloud State University for their superb work with proofreading and accuracy checking. Thanks also to Jessica Rockswold for preparing the art manuscript and proofreading the text.

Without the excellent cooperation from the professional staff at Addison-Wesley, this project would have been impossible. They are, without a doubt, the best. Thanks go to Greg Tobin for his support of this project. Particular recognition is due Anne Kelly and Chere Bemelmans, who gave advice, support, assistance, and encouragement. The outstanding contributions of Kathy Manley, Leah Goldberg, Barbara Atkinson, Beth Paquin, Katherine Greig, Bonnie Gill, and Joe Vetere are much appreciated. The outstanding work of Kathy Diamond was instrumental to the success of this project.

Thanks go to Wendy Rockswold, who gave invaluable assistance and encouragement throughout the project.

A special thank you goes to the many students and instructors who used the first three editions. Their suggestions were insightful. Please feel free to contact me at gary.rockswold@mnsu.edu or Department of Mathematics, Minnesota State University, Mankato, MN 56001 with your comments. Your opinion is important.

Gary Rockswold

Introduction to Functions and Graphs

1

Have you ever thought about how we “live by the numbers”? Money, digital televisions, speed limits, grade point averages, gas mileages, and temperatures are all based on numbers. When we are told what our weight, blood pressure, body mass index, and cholesterol level are, these numbers can even affect how we feel about ourselves. Numbers permeate our society.

People are concerned about our environment and how it is changing. Do cars and their carbon dioxide emissions contribute to global warming? Conventional cars are inherently inefficient because they burn gasoline when they are not moving. Hybrid vehicles may be a viable option, but no doubt numbers will be used to make a decision. Rates of change, consumption, efficiency, and pollution levels are all described by numbers.

Numbers are part of mathematics, but mathematics is *much more* than numbers. Mathematics also includes techniques to analyze these numbers and to guide our decisions about the future. Mathematics is used not only in science and technology; it is also used to describe almost every facet of life, including consumer behavior and the Internet.

In this chapter we discuss numbers and how functions are used to perform computations with these numbers. Understanding numbers and mathematical concepts is essential to understanding and dealing with the many changes that will occur in our lifetimes. Mathematics makes life easier!

The essence of mathematics is not to make simple things complicated, but to make complicated things simple.

—Stanley Gudder

1.1 Numbers, Data, and Problem Solving

- Recognize common sets of numbers
- Evaluate expressions by applying the order of operations
- Learn scientific notation and use it in applications
- Apply problem-solving strategies

Introduction

Because society is becoming more complex and diverse, our need for mathematics is increasing dramatically each year. Numbers are essential to our everyday lives. For example, the iPhone is 4.5 inches in height, 2.4 inches in width, and 0.46 inch in thickness. It has an 8-gigabyte flash drive, a 2-megapixel camera, and 480-by-320-pixel screen resolution, and it can operate at temperatures between 32° and 95°F. (Source: Apple Corporation.)

Mathematics not only provides numbers to describe new products, but also gives us problem-solving strategies. This section discusses basic sets of numbers and introduces some essential problem-solving strategies.

Sets of Numbers

One important set of numbers is the set of **natural numbers**. This set comprises the *counting numbers* $N = \{1, 2, 3, 4, \dots\}$. Natural numbers can be used when data are positive and not presented in fractional parts.

The **integers** $I = \{\dots, -3, -2, -1, 0, 1, 2, 3, \dots\}$ are a set of numbers that contains the natural numbers, their additive inverses (negatives), and 0. Historically, negative numbers were not readily accepted. Today, however, when a person overdraws a personal checking account for the first time, negative numbers quickly take on meaning. There is a significant difference between a positive and a negative balance.

A **rational number** can be expressed as the *ratio* of two integers $\frac{p}{q}$, where $q \neq 0$. Rational numbers include the integers. Examples of rational numbers are

$$\frac{2}{1}, \frac{1}{3}, -\frac{1}{4}, \frac{-50}{2}, \frac{22}{7}, 0, \sqrt{25}, \text{ and } 1.2.$$

Note that 0 and 1.2 are both rational numbers. They can be represented by the fractions $\frac{0}{1}$ and $\frac{12}{10}$. Because two fractions that look different can be equivalent, rational numbers have more than one form. A rational number can always be expressed in a decimal form that either *repeats* or *terminates*. For example, $\frac{2}{3} = 0.\overline{6}$, a repeating decimal, and $\frac{1}{4} = 0.25$, a terminating decimal. The overbar indicates that $0.\overline{6} = 0.666666\dots$

Real numbers can be represented by decimal numbers. Since every rational number has a decimal form, real numbers include rational numbers. However, some real numbers cannot be expressed as a ratio of two integers. These numbers are called **irrational numbers**. The numbers $\sqrt{2}$, $\sqrt{15}$, and π are examples of irrational numbers. They can be represented by nonrepeating, nonterminating decimals. Note that for any positive integer a , if \sqrt{a} is not an integer, then \sqrt{a} is an irrational number.

Real numbers include both rational and irrational numbers and can be *approximated* by a terminating decimal. Examples of real numbers include

$$2, -10, -131.3337, \frac{1}{3} = 0.\overline{3}, -\sqrt{5} \approx -2.2361, \text{ and } \sqrt{11} \approx 3.3166.$$

CLASS DISCUSSION

The number 0 was invented well after the natural numbers. Many societies did not have a zero—for example, there is no Roman numeral for 0. Discuss some possible reasons for this.

NOTE The symbol \approx means **approximately equal**. This symbol is used in place of an equals sign whenever two unequal quantities are close in value. For example, $\frac{1}{4} = 0.25$, whereas $\frac{1}{3} \approx 0.3333$.

EXAMPLE 1 Classifying numbers

Classify each real number as one or more of the following: natural number, integer, rational number, or irrational number.

$$5, -1.2, \frac{13}{7}, -\sqrt{7}, -12, \sqrt{16}$$

SOLUTION

5: natural number, integer, and rational number

-1.2: rational number

$\frac{13}{7}$: rational number

$-\sqrt{7}$: irrational number

-12: integer and rational number

$\sqrt{16} = 4$: natural number, integer, and rational number

Now Try Exercise 7 ◀

Order of Operations

Does $6 - 3 \cdot 2$ equal 0 or 6? Does -5^2 equal 25 or -25? Figure 1.1 correctly shows that $6 - 3 \cdot 2 = 0$ and that $-5^2 = -25$. Because multiplication is performed before subtraction, $6 - 3 \cdot 2 = 0$. Similarly, because exponents are evaluated before performing negation, $-5^2 = -25$. It is essential that algebraic expressions be evaluated consistently, so the following rules have been established.

Figure 1.1

Order of Operations

Using the following order of operations, first perform all calculations within parentheses, square roots, and absolute value bars and above and below fraction bars. Then use the same order of operations to perform any remaining calculations.

1. Evaluate all exponents. Then do any negation *after* evaluating exponents.
2. Do all multiplication and division from *left to right*.
3. Do all addition and subtraction from *left to right*.

EXAMPLE 2 Evaluating arithmetic expressions

Evaluate each expression by hand.

$$(a) \ 3(1 - 5)^2 - 4^2 \quad (b) \ \frac{10 - 6}{5 - 3} - 4 - |7 - 2|$$

SOLUTION

$$\begin{aligned} (a) \ 3(1 - 5)^2 - 4^2 &= 3(-4)^2 - 4^2 & (b) \ \frac{10 - 6}{5 - 3} - 4 - |7 - 2| &= \frac{4}{2} - 4 - |5| \\ &= 3(16) - 16 & &= 2 - 4 - 5 \\ &= 48 - 16 & &= -2 - 5 \\ &= 32 & &= -7 \end{aligned}$$

NOTE $(-4)^2 = (-4)(-4) = 16$ and $-4^2 = -(4)(4) = -16$.

Now Try Exercises 19 and 21 ◀

Scientific Notation

Numbers that are large or small in absolute value are often expressed in scientific notation. Table 1.1 lists examples of numbers in **standard (decimal) form** and in **scientific notation**.

Table 1.1

Standard Form	Scientific Notation	Application
93,000,000 mi	9.3×10^7 mi	Distance to the sun
13,517	1.3517×10^4	Radio stations in 2005
9,000,000,000	9×10^9	Estimated world population in 2050
0.00000538 sec	5.38×10^{-6} sec	Time for light to travel 1 mile
0.000005 cm	5×10^{-6} cm	Size of a typical virus

To write 0.00000538 in scientific notation, start by moving the decimal point to the right of the first nonzero digit, 5, to obtain 5.38. Since the decimal point was moved six places to the *right*, the exponent of 10 is -6 . Thus, $0.00000538 = 5.38 \times 10^{-6}$. When the decimal point is moved to the *left*, the exponent of 10 is positive, rather than negative. Here is a formal definition of scientific notation.

Scientific Notation

A real number r is in **scientific notation** when r is written as $c \times 10^n$, where $1 \leq |c| < 10$ and n is an integer.

Calculator Help

To display numbers in scientific notation, see Appendix A (page AP-2).

An Application Nanotechnology involves extremely small electrical circuits. Someday this technology may use the movement of the human body to power tiny devices such as pacemakers. The next example demonstrates how scientific notation appears in the description of this new technology.

EXAMPLE 1 Analyzing the energy produced by your body

Nanotechnology is a technology of the very small: on the order of one billionth of a meter. Researchers are looking to power tiny devices with energy generated by the human body. (Source: Z. Wang, "Self-Powered Nanotech," *Scientific American*, January 2008.)

- Write one billionth in scientific notation.
- While typing, a person's fingers generate about 2.2×10^{-3} watt of electrical energy. Write this number in standard (decimal) form.

SOLUTION

- One billionth can be written as $\frac{1}{1,000,000,000} = \frac{1}{10^9} = 1 \times 10^{-9}$.
- Move the decimal point in 2.2 three places to the left: $2.2 \times 10^{-3} = 0.0022$.

Now Try Exercise 83 ◀

The next two examples illustrate how to evaluate expressions involving scientific notation.

EXAMPLE 4 Evaluating expressions by hand

Evaluate each expression. Write your result in scientific notation and standard form.

(a) $(3 \times 10^3)(2 \times 10^4)$ (b) $(5 \times 10^{-3})(6 \times 10^5)$ (c) $\frac{4.6 \times 10^{-1}}{2 \times 10^2}$

SOLUTION

(a) $(3 \times 10^3)(2 \times 10^4) = 3 \times 2 \times 10^3 \times 10^4$ Commutative property
 $= 6 \times 10^{3+4}$ Add exponents.
 $= 6 \times 10^7$ Scientific notation
 $= 60,000,000$ Standard form

(b) $(5 \times 10^{-3})(6 \times 10^5) = 5 \times 6 \times 10^{-3} \times 10^5$ Commutative property
 $= 30 \times 10^2$ Add exponents.
 $= 3 \times 10^3$ Scientific notation
 $= 3000$ Standard form

(c) $\frac{4.6 \times 10^{-1}}{2 \times 10^2} = \frac{4.6}{2} \times \frac{10^{-1}}{10^2}$ Multiplication of fractions
 $= 2.3 \times 10^{-1-2}$ Subtract exponents.
 $= 2.3 \times 10^{-3}$ Scientific notation
 $= 0.0023$ Standard form

Now Try Exercises 53, 55, and 57 ◀

Calculators Calculators often use **E** to express powers of 10. For example, 4.2×10^{-3} might be displayed as 4.2E-3. On some calculators, numbers can be entered in scientific notation with the **(EE)** key, which you can find by pressing **(2nd)** **(,)**.

EXAMPLE 5 Computing in scientific notation with a calculator

Approximate each expression. Write your answer in scientific notation.

(a) $\left(\frac{6 \times 10^3}{4 \times 10^6}\right)(1.2 \times 10^2)$ (b) $\sqrt{4500\pi} \left(\frac{103 + 450}{0.233}\right)^3$

SOLUTION

(a) The given expression is entered in two ways in Figure 1.2. Note that in both cases

$$\left(\frac{6 \times 10^3}{4 \times 10^6}\right)(1.2 \times 10^2) = 0.18 = 1.8 \times 10^{-1}.$$

(b) Be sure to insert parentheses around 4500π and around the numerator, $103 + 450$, in the ratio. From Figure 1.3 we can see that the result is approximately 1.59×10^{12} .

Figure 1.2 shows two ways to enter the expression $\left(\frac{6 \times 10^3}{4 \times 10^6}\right)(1.2 \times 10^2)$ on a calculator. The first way uses standard notation with multiplication and division symbols, resulting in .18. The second way uses scientific notation with the E key, also resulting in .18.

Figure 1.2

Figure 1.3 shows the calculator input for expression (b): $\sqrt{4500\pi} \left(\frac{103 + 450}{0.233}\right)^3$. The result displayed is 1.58960355E12.

Figure 1.3

Algebra Review

To review exponents, see Chapter R (page R-7).

Calculator Help

To enter numbers in scientific notation, see Appendix A (page AP-2).

Now Try Exercises 61 and 63 ◀

EXAMPLE 6 Computing with a calculator

Use a calculator to evaluate each expression. Round answers to the nearest thousandth.

(a) $\sqrt[3]{131}$ (b) $\pi^3 + 1.2^2$ (c) $\frac{1 + \sqrt{2}}{3.7 + 9.8}$ (d) $|\sqrt{3} - 6|$

SOLUTION

- (a) On some calculators the cube root can be found by using the MATH menu. If your calculator does not have a cube root key, enter $131^{1/3}$. From the first two lines in Figure 1.4, we see that $\sqrt[3]{131} \approx 5.079$.
- (b) Do *not* use 3.14 for the value of π . Instead, use the built-in key to obtain a more accurate value of π . From the bottom two lines in Figure 1.4, $\pi^3 + 1.2^2 \approx 32.446$.
- (c) When evaluating this expression be sure to include parentheses around the numerator and around the denominator. Most calculators have a special square root key that can be used to evaluate $\sqrt{2}$. From the first three lines in Figure 1.5, $\frac{1 + \sqrt{2}}{3.7 + 9.8} \approx 0.179$.
- (d) The absolute value can be found on some calculators by using the MATH NUM menus. From the bottom two lines in Figure 1.5, $|\sqrt{3} - 6| \approx 4.268$.

Algebra Review

To review cube roots, see Chapter R (page R-40).

Calculator Help

To enter expressions such as $\sqrt[3]{131}$, $\sqrt{2}$, π , and $|\sqrt{3} - 6|$, see Appendix A (page AP-2).

Figure 1.4

Figure 1.5

Now Try Exercises 67, 69, 71, and 73 ◀

Problem Solving

Many problem-solving strategies are used in algebra. However, in this subsection we focus on two important strategies that are used frequently: making a sketch and applying one or more formulas. These strategies are illustrated in the next three examples.

EXAMPLE 7 Finding the speed of Earth

Earth travels around the sun in an approximately circular orbit with an average radius of 93 million miles. If Earth takes 1 year, or about 365 days, to complete one orbit, estimate the orbital speed of Earth in miles per hour.

SOLUTION

Getting Started Speed S equals distance D divided by time T , $S = \frac{D}{T}$. We need to find the number of miles Earth travels in 1 year and then divide it by the number of hours in 1 year. ▶

Distance Traveled A sketch of Earth orbiting the sun is shown in Figure 1.6. In 1 year Earth travels the circumference of a circle with a radius of 93 million miles. The circumference of a circle is $2\pi r$, where r is the radius, so the distance D is

$$D = 2\pi r = 2\pi(93,000,000) \approx 584,300,000 \text{ miles.}$$

Geometry Review

To find the circumference of a circle, see Chapter R (page R-2).

Figure 1.6 Earth's Orbit

Hours in 1 Year The number of hours H in 1 year, or 365 days, equals

$$H = 365 \times 24 = \mathbf{8760} \text{ hours.}$$

Speed of Earth $S = \frac{D}{H} = \frac{584,300,000}{8760} \approx 66,700$ miles per hour.

Now Try Exercise 85

Many times in geometry we evaluate formulas to determine quantities, such as perimeter, area, and volume. In the next example we use a formula to determine the number of fluid ounces in a soda can.

EXAMPLE 8 Finding the volume of a soda can

The volume V of the cylindrical soda can in Figure 1.7 is given by $V = \pi r^2 h$, where r is its radius and h is its height.

- (a) If $r = 1.4$ inches and $h = 5$ inches, find the volume of the can in cubic inches.
- (b) Could this can hold 16 fluid ounces? (Hint: 1 cubic inch equals 0.55 fluid ounce.)

SOLUTION

(a) $V = \pi r^2 h = \pi (1.4)^2 (5) = 9.8\pi \approx 30.8$ cubic inches.

(b) To find the number of fluid ounces, multiply the number of cubic inches by 0.55.

$$30.8 \times 0.55 = 16.94$$

Yes, the can could hold 16 fluid ounces.

Now Try Exercise 93

Figure 1.7 A Soda Can

Measuring the thickness of a very thin layer of material can be difficult to do directly. For example, it would be difficult to measure the thickness of a sheet of aluminum foil or a coat of paint with a ruler. However, it can be done indirectly using the following formula.

$$\text{Thickness} = \frac{\text{Volume}}{\text{Area}}$$

That is, the thickness of a thin layer equals the volume of the substance divided by the area that it covers. For example, if a volume of 1 cubic inch of paint is spread over an area of 100 square inches, then the thickness of the paint equals $\frac{1}{100}$ inch. This formula is illustrated in the next example.

EXAMPLE 9 Calculating the thickness of aluminum foil

A rectangular sheet of aluminum foil is 15 centimeters by 35 centimeters and weighs 5.4 grams. If 1 cubic centimeter of aluminum weighs 2.7 grams, find the thickness of the aluminum foil. (Source: U. Haber-Schaim, *Introductory Physical Science*.)

SOLUTION

Getting Started Start by making a sketch of a rectangular sheet of aluminum, as shown in Figure 1.8. To complete this problem we need to find the volume V of the aluminum foil and its area A . Then we can determine the thickness T by using the formula $T = \frac{V}{A}$.

Figure 1.8 Aluminum Foil

NOTE For the rectangular box shape shown in Figure 1.8 on the previous page,

$$\text{Volume} = \text{Length} \times \text{Width} \times \text{Thickness.}$$

$\xrightarrow{\text{Area}}$

Geometry Review
To find the area of a rectangle, see Chapter R (page R-1). To find the volume of a box, see Chapter R (page R-3).

It follows that $\text{Thickness} = \frac{\text{Volume}}{\text{Area}}$.
Volume Because the aluminum foil weighs 5.4 grams and each 2.7 grams equals 1 cubic centimeter, the volume of the aluminum foil is

$$\frac{5.4}{2.7} = 2 \text{ cubic centimeters.} \quad \text{Divide weight by density.}$$

Area The aluminum foil is rectangular with an area of $15 \times 35 = 525$ square centimeters.
Thickness The thickness of 2 cubic centimeters of aluminum foil with an area of 525 square centimeters is

$$\text{Thickness} = \frac{\text{Volume}}{\text{Area}} = \frac{2}{525} \approx 0.0038 \text{ centimeter.}$$

Now Try Exercise 89 ◀

1.1 Putting It All Together

Numbers play a central role in our society. Without numbers, data could be described qualitatively but not quantitatively. For example, we could say that the day seems hot but would not be able to give an actual number for the temperature. Problem-solving strategies are used in almost every facet of our lives, providing the procedures needed to systematically complete tasks and perform computations.
The following table summarizes some of the concepts in this section.

Concept	Comments	Examples
Natural numbers	Sometimes referred to as the <i>counting numbers</i>	1, 2, 3, 4, 5, ...
Integers	Include the natural numbers, their opposites, and 0	..., -2, -1, 0, 1, 2, ...
Rational numbers	Include integers; all fractions $\frac{p}{q}$, where p and q are integers with $q \neq 0$; all repeating and all terminating decimals	$\frac{1}{2}$, -3 , $\frac{128}{6}$, -0.335 , 0 , $0.25 = \frac{1}{4}$, $0.\overline{33} = \frac{1}{3}$
Irrational numbers	Can be written as nonrepeating, nonterminating decimals; cannot be a rational number; if a square root of a positive integer is not an integer, it is an irrational number.	π , $\sqrt{2}$, $-\sqrt{5}$, $\sqrt[3]{7}$, π^4

Concept	Comments	Examples
Real numbers	Any number that can be expressed in standard (decimal) form Include the rational numbers and irrational numbers	$\pi, \sqrt{7}, -\frac{4}{7}, 0, -10, 1.237$ $0.\overline{6} = \frac{2}{3}, 1000, \sqrt{15}, -\sqrt{5}$
Order of operations	Using the following order of operations, first perform all calculations within parentheses, square roots, and absolute value bars and above and below fraction bars. Then perform any remaining calculations. 1. Evaluate all exponents. Then do any negation <i>after</i> evaluating exponents. 2. Do all multiplication and division from <i>left to right</i> . 3. Do all addition and subtraction from <i>left to right</i> .	$\begin{aligned} -4^2 - 12 \div 2 - 2 &= -16 - 12 \div 2 - 2 \\ &= -16 - 6 - 2 \\ &= -22 - 2 \\ &= -24 \\ \frac{2 + 4^2}{3 - 3 \cdot 5} &= \frac{2 + 16}{3 - 15} \\ &= \frac{18}{-12} \\ &= -\frac{3}{2} \end{aligned}$
Scientific notation	A number in the form $c \times 10^n$, where $1 \leq c < 10$ and n is an integer Used to represent numbers that are large or small in absolute value	$3.12 \times 10^4 = 31,200$ $-1.4521 \times 10^{-2} = -0.014521$ $5 \times 10^9 = 5,000,000,000$ $1.5987 \times 10^{-6} = 0.0000015987$

1.1 Exercises

Classifying Numbers

Exercises 1–6: Classify the number as one or more of the following: natural number, integer, rational number, or real number.

- $\frac{21}{24}$ (Fraction of people in the United States completing at least 4 years of high school)
- 20,082 (Average cost in dollars of tuition and fees at a private college in 2004)
- 7.5 (Average number of gallons of water used each minute while taking a shower)
- 25.8 (Nielsen rating of the TV show *Grey's Anatomy* the week of February 12–18, 2007)
- $90\sqrt{2}$ (Distance in feet from home plate to second base on a baseball field)
- -71 (Wind chill when the temperature is -30°F and the wind speed is 40 mph)

Exercises 7–10: Classify each number as one or more of the following: natural number, integer, rational number, or irrational number.

- $\pi, -3, \frac{2}{9}, \sqrt{9}, 1.\bar{3}, -\sqrt{2}$
- $\frac{3}{1}, -\frac{5}{8}, \sqrt{7}, 0.\overline{45}, 0, 5.6 \times 10^3$
- $\sqrt{13}, \frac{1}{3}, 5.1 \times 10^{-6}, -2.33, 0.\bar{7}, -\sqrt{4}$
- $-103, \frac{21}{25}, \sqrt{100}, -\frac{5.7}{10}, \frac{2}{9}, -1.457, \sqrt{3}$

Exercises 11–16: For the measured quantity, state the set of numbers that most appropriately describes it. Choose from the natural numbers, integers, and rational numbers. Explain your answer.

- Shoe sizes
- Populations of states
- Gallons of gasoline
- Speed limits

15. Temperatures in a winter weather forecast in Montana

16. Numbers of compact disc sales

Order of Operations*Exercises 17–28: Evaluate by hand.*

17. $|5 - 8 \cdot 7|$ 18. $-2(16 - 3 \cdot 5) \div 2$

19. $-6^2 - 3(2 - 4)^4$ 20. $(4 - 5)^2 - 3^2 - 3\sqrt{9}$

21. $\sqrt{9 - 5} - \frac{8 - 4}{4 - 2}$ 22. $\frac{6 - 4^2 \div 2^3}{3 - 4}$

23. $\sqrt{13^2 - 12^2}$ 24. $\frac{13 - \sqrt{9 + 16}}{|5 - 7|^2}$

25. $\frac{4 + 9}{2 + 3} - \frac{-3^2 \cdot 3}{5}$ 26. $10 \div 2 \div \frac{5 + 10}{5}$

27. $-5^2 - 20 \div 4 - 2$ 28. $5 - (-4)^3 - (4)^3$

Scientific Notation*Exercises 29–40: Write the number in scientific notation.*

29. 184,800 (New lung cancer cases reported in 2005)

30. 29,285,000 (People worldwide living with HIV)

31. 0.04361 (Proportion of U.S. deaths attributed to accidents in 2004)

32. 0.62 (Number of miles in 1 kilometer)

33. 2450 34. 105.6

35. 0.56 36. -0.00456 37. -0.0087 38. 1,250,000

39. 206.8 40. 0.00007

*Exercises 41–52: Write the number in standard form.*41. 1×10^{-6} (Wavelength in meters of visible light)42. 9.11×10^{-31} (Weight in kilograms of an electron)43. 2×10^8 (Years required for the sun to orbit our galaxy)44. 9×10^{12} (Federal debt in dollars in 2007)45. 1.567×10^2 46. -5.68×10^{-1} 47. 5×10^5 48. 3.5×10^3

49. 0.045×10^5

50. -5.4×10^{-5}

51. 67×10^3

52. 0.0032×10^{-1}

Exercises 53–60: Evaluate the expression by hand. Write your result in scientific notation and standard form.

53. $(4 \times 10^3)(2 \times 10^5)$ 54. $(3 \times 10^1)(3 \times 10^4)$

55. $(5 \times 10^2)(7 \times 10^{-4})$ 56. $(8 \times 10^{-3})(7 \times 10^1)$

57. $\frac{6.3 \times 10^{-2}}{3 \times 10^1}$ 58. $\frac{8.2 \times 10^2}{2 \times 10^{-2}}$

59. $\frac{4 \times 10^{-3}}{8 \times 10^{-1}}$ 60. $\frac{2.4 \times 10^{-5}}{4.8 \times 10^{-7}}$

Exercises 61–66: Use a calculator to approximate the expression. Write your result in scientific notation.

61. $\frac{8.947 \times 10^7}{0.00095} (4.5 \times 10^8)$

62. $(9.87 \times 10^6)(34 \times 10^{11})$

63. $\left(\frac{101 + 23}{0.42}\right)^2 + \sqrt{3.4 \times 10^{-2}}$

64. $\sqrt[3]{(2.5 \times 10^{-8}) + 10^{-7}}$

65. $(8.5 \times 10^{-5})(-9.5 \times 10^7)^2$

66. $\sqrt{\pi(4.56 \times 10^4) + (3.1 \times 10^{-2})}$

Exercises 67–76: Use a calculator to evaluate the expression. Round your result to the nearest thousandth.

67. $\sqrt[3]{192}$ 68. $\sqrt{(32 + \pi^3)}$

69. $|\pi - 3.2|$ 70. $\frac{1.72 - 5.98}{35.6 + 1.02}$

71. $\frac{0.3 + 1.5}{5.5 - 1.2}$ 72. $3.2(1.1)^2 - 4(1.1) + 2$

73. $\frac{1.5^3}{\sqrt{2 + \pi} - 5}$ 74. $4.3^2 - \frac{5}{17}$

75. $15 + \frac{4 + \sqrt{3}}{7}$ 76. $\frac{5 + \sqrt{5}}{2}$

Applications*Exercises 77–80: Percent Change* If an amount changes from A to a new amount B , then the percent change is $\frac{B - A}{A} \times 100$.

Calculate the percent change for the given A and B . Round your answer to the nearest tenth of a percent when appropriate.

77. $A = \$8, B = \13 78. $A = \$0.90, B = \13.47

79. $A = 1.4, B = 0.85$ 80. $A = 1256, B = 1195$

81. **Percent Change** Suppose that tuition is initially \$100 per credit and increases by 6% from the first year to the second year. What is the cost of tuition the second year? Now suppose that tuition decreases by 6% from the second to the third year. Is tuition equal to \$100 per credit the third year? Explain.

82. **Tuition Increases** From 1976 to 2004, average annual tuition and fees at public colleges and universities increased from \$433 to \$5132. Calculate the percent change over this time period.

83. **Nanotechnology** (Refer to Example 3.) During inhalation, the typical body generates 0.14 watt of electrical power, which could be used to power tiny electrical circuits. Write this number in scientific notation. (Source: *Scientific American*, January 2008.)

84. **Movement of the Pacific Plate** The Pacific plate (the floor of the Pacific Ocean) near Hawaii is moving at about 0.000071 kilometer per year. This is about the speed at which a fingernail grows. Use scientific notation to determine how many kilometers the Pacific plate travels in one million years.

85. **Orbital Speed** (Refer to Example 7.) The planet Mars travels around the sun in a nearly circular orbit with a radius of 141 million miles. If it takes 1.88 years for Mars to complete one orbit, estimate the orbital speed of Mars in miles per hour.

86. **Size of the Milky Way** The speed of light is about 186,000 miles per second. The Milky Way galaxy has an approximate diameter of 6×10^{17} miles. Estimate, to the nearest thousand, the number of years it takes for light to travel across the Milky Way. (Source: C. Ronan, *The Natural History of the Universe*.)

87. **Federal Debt** The amount of federal debt changed dramatically during the 30 years from 1970 to 2000. (Sources: Department of the Treasury, Bureau of the Census.)

(a) In 1970 the population of the United States was 203,000,000 and the federal debt was \$370 billion. Find the debt per person.

(b) In 2000 the population of the United States was approximately 281,000,000 and the federal debt was \$5.54 trillion. Find the debt per person.

88. **Discharge of Water** The Amazon River discharges water into the Atlantic Ocean at an average rate of 4,200,000 cubic feet per second, the highest rate of any river in the world. Is this more or less than 1 cubic mile of water per day? Explain your calculations. (Source: *The Guinness Book of Records* 1993.)

89. **Thickness of an Oil Film** (Refer to Example 9.) A drop of oil measuring 0.12 cubic centimeter is spilled onto a lake. The oil spreads out in a circular shape having a diameter of 23 centimeters. Approximate the thickness of the oil film.

90. **Thickness of Gold Foil** (Refer to Example 9.) A flat, rectangular sheet of gold foil measures 20 centimeters by 30 centimeters and has a mass of 23.16 grams. If 1 cubic centimeter of gold has a mass of 19.3 grams, find the thickness of the gold foil. (Source: U. Haber-Schaim, *Introductory Physical Science*.)

91. **Analyzing Debt** A 1-inch-high stack of \$100 bills contains about 250 bills. In 2000 the federal debt was approximately 5.54 trillion dollars.

(a) If the entire federal debt were converted into a stack of \$100 bills, how many feet high would it be?

(b) The distance between Los Angeles and New York is approximately 2500 miles. Could this stack of \$100 bills reach between these two cities?

92. **Volume of a Cone** The volume V of a cone is given by $V = \frac{1}{3}\pi r^2 h$, where r is its radius and h is its height. Find V when $r = 4$ inches and $h = 1$ foot. Round your answer to the nearest hundredth.

93. **Size of a Soda Can** (Refer to Example 8.) The volume V of a cylindrical soda can is given by $V = \pi r^2 h$, where r is its radius and h is its height.
- If $r = 1.3$ inches and $h = 4.4$ inches, find the volume of the can in cubic inches.
 - Could this can hold 12 fluid ounces? (*Hint*: 1 cubic inch equals about 0.55 fluid ounce.)
94. **Volume of a Sphere** The volume of a sphere is given by $V = \frac{4}{3}\pi r^3$, where r is the radius of the sphere. Calculate the volume if the radius is 3 feet. Approximate your answer to the nearest tenth.

95. **Thickness of Cement** (Refer to Example 9.) A 100-foot-long sidewalk is 5 feet wide. If 125 cubic feet of cement are evenly poured to form the sidewalk, find the thickness of the sidewalk.
96. **Depth of a Lake** (Refer to Example 9.) A lake covers 2.5×10^7 square feet and contains 7.5×10^8 cubic feet of water. Find the average depth of the lake.

Writing about Mathematics

97. Describe some basic sets of numbers that are used in mathematics.
98. Suppose that a positive number a is written in scientific notation as $a = b \times 10^n$, where n is an integer and $1 \leq b \leq 10$. Explain what n indicates about the size of a .

EXTENDED AND DISCOVERY EXERCISE

- If you have access to a scale that weighs in grams, find the thickness of regular and heavy-duty aluminum foil. Is heavy-duty foil worth the price difference? (*Hint*: Each 2.7 grams of aluminum equals 1 cubic centimeter.)

1.2 Visualizing and Graphing Data

- Analyze one-variable data
- Find the domain and range of a relation
- Graph in the xy -plane
- Calculate distance
- Find the midpoint
- Learn the standard equation of a circle
- Learn to graph equations with a calculator (optional)

Introduction

Technology is giving us access to huge amounts of data. For example, space telescopes, such as the Hubble telescope, are providing a wealth of information about the universe. The challenge is to convert the data into meaningful information that can be used to solve important problems. Before conclusions can be drawn, data must be analyzed. A powerful tool in this step is visualization, as pictures and graphs are often easier to understand than words. This section discusses how different types of data can be visualized by using various mathematical techniques.

One-Variable Data

Data often occur in the form of a list. A list of test scores without names is an example; the only variable is the score. Data of this type are referred to as **one-variable data**. If the values in a list are unique, they can be represented visually on a number line.

Means and medians can be found for one-variable data sets. To calculate the **mean** (or **average**) of a set of n numbers, we add the n numbers and then divide the sum by n . The **median** is equal to the value that is located in the middle of a *sorted* list. If there is an odd

number of data items, the median is the middle data item. If there is an even number of data items, the median is the average of the two middle items.

EXAMPLE 1 Analyzing a list of data

Table 1.2 lists the monthly average temperatures in degrees Fahrenheit at Mould Bay, Canada.

Table 1.2 Monthly Average Temperatures at Mould Bay, Canada

Temperature (°F)	-27	-31	-26	-9	12	32	39	36	21	1	-17	-24
------------------	-----	-----	-----	----	----	----	----	----	----	---	-----	-----

Source: A. Miller and J. Thompson, *Elements of Meteorology*.

- Plot these temperatures on a number line.
- Find the maximum and minimum temperatures.
- Determine the mean of these 12 temperatures.
- Find the median and interpret the result.

SOLUTION

- In Figure 1.9 the numbers in Table 1.2 are plotted on a number line.

Figure 1.9 Monthly Average Temperatures

CLASS DISCUSSION

In Example 1(c), the mean of the temperatures is approximately 0.6°F . Interpret this temperature. Explain your reasoning.

- The maximum temperature of 39°F is plotted farthest to the right in Figure 1.9. Similarly, the minimum temperature of -31°F is plotted farthest to the left.
- The sum of the 12 temperatures in Table 1.2 equals 7. The mean, or average, of these temperatures is $\frac{7}{12} \approx 0.6^\circ\text{F}$.
- Because there is an even number of data items, the median is the average of the middle two values. From the number line we see that the middle two values are -9°F and 1°F . Thus the median is $\frac{-9 + 1}{2} = -4^\circ\text{F}$. This result means that half the months have an average temperature that is greater than -4°F and half the months have an average temperature that is below -4°F .

Now Try Exercises 1 and 5 ◀

Two-Variable Data

Sometimes a relationship exists between two lists of data. Table 1.3 lists the monthly average precipitation in inches for Portland, Oregon. In this table, 1 corresponds to January, 2 to February, and so on, until 12 represents December. We show the relationship between a month and its average precipitation by combining the two lists so that corresponding months and precipitations are visually paired.

Table 1.3 Average Precipitation for Portland, Oregon

Month	1	2	3	4	5	6	7	8	9	10	11	12
Precipitation (inches)	6.2	3.9	3.6	2.3	2.0	1.5	0.5	1.1	1.6	3.1	5.2	6.4

If x is the month and y is the precipitation, then the **ordered pair** (x, y) represents the average amount of precipitation y during month x . For example, the ordered pair $(5, 2.0)$ indicates that the average precipitation in May is 2.0 inches, whereas the ordered pair $(2, 3.9)$ indicates that the average precipitation in February is 3.9 inches. *Order is important* in an ordered pair.

Since the data in Table 1.3 involve two variables, the month and precipitation, we refer to them as **two-variable data**. It is important to realize that a relation established by two-variable data is between two lists rather than within a single list. January is not related to August, and 6.2 inches of precipitation is not associated with 1.1 inches of precipitation. Instead, January is paired with 6.2 inches, and August is paired with 1.1 inches. We now define the mathematical concept of a relation.

Relation

A **relation** is a set of ordered pairs.

If we denote the ordered pairs in a relation by (x, y) , then the set of all x -values is called the **domain** of the relation and the set of all y -values is called the **range**. The relation shown in Table 1.3 has domain

$D = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12\}$

x-values

and range

$R = \{0.5, 1.1, 1.5, 1.6, 2.0, 2.3, 3.1, 3.6, 3.9, 5.2, 6.2, 6.4\}.$

y-values

EXAMPLE 2 Finding the domain and range of a relation

A physics class measured the time y that it takes for an object to fall x feet, as shown in Table 1.4. The object was dropped twice from each height.

Table 1.4 Falling Object

x (feet)	20	20	40	40
y (seconds)	1.2	1.1	1.5	1.6

- (a) Express the data as a relation S .
- (b) Find the domain and range of S .

SOLUTION

- (a) A relation is a set of ordered pairs, so we can write

$S = \{(20, 1.2), (20, 1.1), (40, 1.5), (40, 1.6)\}.$

- (b) The domain is the set of x -values of the ordered pairs, or $D = \{20, 40\}$. The range is the set of y -values of the ordered pairs, or $R = \{1.1, 1.2, 1.5, 1.6\}$.

Now Try Exercise 47 ◀

To visualize a relation, we often use the **Cartesian (rectangular) coordinate plane**, or **xy -plane**. The horizontal axis is the **x -axis** and the vertical axis is the **y -axis**. The axes

Figure 1.10 The xy -plane

intersect at the **origin** and determine four regions called **quadrants**, numbered I, II, III, and IV, counterclockwise, as shown in Figure 1.10. We can plot the ordered pair (x, y) using the x - and y -axes. The point $(1, 2)$ is located in quadrant I, $(-2, 3)$ in quadrant II, $(-4, -4)$ in quadrant III, and $(1, -2)$ in quadrant IV. A point lying on a coordinate axis does not belong to any quadrant. The point $(-3, 0)$ is located on the x -axis, whereas the point $(0, -3)$ lies on the y -axis.

The term **scatterplot** is given to a graph in the xy -plane where distinct points are plotted. Figure 1.10 is an example of a scatterplot.

EXAMPLE 3 Graphing a relation

Complete the following for the relation

$$S = \{(5, 10), (5, -5), (-10, 10), (0, 15), (-15, -10)\}.$$

- Find the domain and range of the relation.
- Determine the maximum and minimum of the x -values and then of the y -values.
- Label appropriate scales on the xy -axes.
- Plot the relation.

SOLUTION

- (a) The elements of the domain correspond to the first number in each ordered pair. Thus

$$D = \{-15, -10, 0, 5\}.$$

Similarly, the elements of the range correspond to the second number in each ordered pair. Thus

$$R = \{-10, -5, 10, 15\}.$$

- x -minimum: -15 ; x -maximum: 5 ; y -minimum: -10 ; y -maximum: 15
- An appropriate scale for both the x -axis and the y -axis might be -20 to 20 , with each tick mark representing a distance of 5 . This scale is shown in Figure 1.11.

Figure 1.11

Figure 1.12

- (d) The points $(5, 10)$, $(5, -5)$, $(-10, 10)$, $(0, 15)$, and $(-15, -10)$ have been plotted in Figure 1.12.

Now Try Exercise 51

Sometimes it is helpful to connect consecutive data points in a scatterplot with straight-line segments. This type of graph, which visually emphasizes changes in the data, is called a **line graph**.

EXAMPLE 4 Making a scatterplot and a line graph

Use Table 1.3 on page 13 to make a scatterplot of average monthly precipitation in Portland, Oregon. Then make a line graph.

SOLUTION Use the x -axis for the months and the y -axis for the precipitation amounts. To make a scatterplot, simply graph the ordered pairs (1, 6.2), (2, 3.9), (3, 3.6), (4, 2.3), (5, 2.0), (6, 1.5), (7, 0.5), (8, 1.1), (9, 1.6), (10, 3.1), (11, 5.2), and (12, 6.4) in the xy -plane, as shown in Figure 1.13. Then connect consecutive data points to make a line graph, as shown in Figure 1.14.

Figure 1.13 Monthly Average Precipitation

Figure 1.14 A Line Graph

Geometry Review

To review the Pythagorean theorem, see Chapter R (page R-2).

Figure 1.15

Figure 1.16

The Distance Formula

In the xy -plane, the length of a line segment with endpoints (x_1, y_1) and (x_2, y_2) can be calculated by using the **Pythagorean theorem**. See Figure 1.15.

The lengths of the legs of the right triangle are $|x_2 - x_1|$ and $|y_2 - y_1|$. The distance d is the hypotenuse of the right triangle. Applying the Pythagorean theorem to this triangle gives $d^2 = (x_2 - x_1)^2 + (y_2 - y_1)^2$. Because distance is nonnegative, we can solve this equation for d to get $d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$.

Distance Formula

The distance d between the points (x_1, y_1) and (x_2, y_2) in the xy -plane is

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}.$$

Figure 1.16 shows a line segment connecting the points $(-1, 3)$ and $(4, -3)$. Its length is

$$\begin{aligned} d &= \sqrt{(4 - (-1))^2 + (-3 - 3)^2} \\ &= \sqrt{61} \\ &\approx 7.81. \end{aligned} \quad \text{(exact length)}$$

EXAMPLE 5 Finding the distance between two points

Find the exact distance between $(3, -4)$ and $(-2, 7)$. Then approximate this distance to the nearest hundredth.

SOLUTION In the distance formula, let (x_1, y_1) be $(3, -4)$ and (x_2, y_2) be $(-2, 7)$.

$$\begin{aligned}\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2} &= \sqrt{(-2 - 3)^2 + (7 - (-4))^2} && \text{Distance formula} \\ &= \sqrt{(-5)^2 + 11^2} && \text{Subtract.} \\ &= \sqrt{146} && \text{Simplify.} \\ &\approx 12.08 && \text{Approximate.}\end{aligned}$$

The exact distance is $\sqrt{146}$, and the approximate distance, rounded to the nearest hundredth, is 12.08. Note that we would obtain the *same* answer if we let (x_1, y_1) be $(-2, 7)$ and (x_2, y_2) be $(3, -4)$.

Now Try Exercise 15 ◀

In the next example the distance between two moving cars is found.

EXAMPLE 6 Finding the distance between two moving cars

Suppose that at noon car A is traveling south at 20 miles per hour and is located 80 miles north of car B. Car B is traveling east at 40 miles per hour.

- Let $(0, 0)$ be the initial coordinates of car B in the xy -plane, where units are in miles. Plot the location of each car at noon and at 1:30 P.M.
- Find the distance between the cars at 1:30 P.M.

SOLUTION

- If the initial coordinates of car B are $(0, 0)$, then the initial coordinates of car A are $(0, 80)$, because car A is 80 miles north of car B. After 1 hour and 30 minutes, or 1.5 hours, car A has traveled $1.5 \times 20 = 30$ miles south, and so it is located 50 miles north of the initial location of car B. Thus its coordinates are $(0, 50)$ at 1:30 P.M. Car B traveled $1.5 \times 40 = 60$ miles east, so its coordinates are $(60, 0)$ at 1:30 P.M. See Figure 1.17, where these points are plotted.

- To find the distance between the cars at 1:30 P.M. we must find the distance d between the points $(0, 50)$ and $(60, 0)$.

$$d = \sqrt{(60 - 0)^2 + (0 - 50)^2} \approx 78.1 \text{ miles}$$

Now Try Exercise 31 ◀

Figure 1.17

The Midpoint Formula

A common way to make estimations is to average data values. For example, in 1980 the average cost of tuition and fees at public colleges and universities was \$800, whereas in 1982 it was \$1000. One might estimate the cost of tuition and fees in 1981 to be \$900. This type of averaging is referred to as finding the midpoint. If a line segment is drawn between two data points, then its *midpoint* is the unique point on the line segment that is equidistant from the endpoints.

On a real number line, the midpoint M of two data points x_1 and x_2 is calculated by averaging their coordinates, as shown in Figure 1.18. For example, the midpoint of -3 and 5 is $M = \frac{-3 + 5}{2} = 1$.

Figure 1.18

Figure 1.19

The midpoint formula in the xy -plane is similar to the formula for the real number line, except that both coordinates are averaged. Figure 1.19 shows midpoint M located on the line segment connecting the two data points (x_1, y_1) and (x_2, y_2) . The x -coordinate of the midpoint M is located halfway between x_1 and x_2 and is $\frac{x_1 + x_2}{2}$. Similarly, the y -coordinate of M is the average of y_1 and y_2 . For example, if we let (x_1, y_1) be $(-3, 1)$ and (x_2, y_2) be $(-1, 3)$ in Figure 1.19, then the midpoint is computed by

$$\left(\frac{-3 + -1}{2}, \frac{1 + 3}{2} \right) = (-2, 2).$$

Midpoint Formula in the xy -Plane

The midpoint of the line segment with endpoints (x_1, y_1) and (x_2, y_2) in the xy -plane is

$$\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right).$$

EXAMPLE 7 Finding the midpoint

Find the midpoint of the line segment connecting the points $(6, -7)$ and $(-4, 3)$.

SOLUTION In the midpoint formula, let (x_1, y_1) be $(6, -7)$ and (x_2, y_2) be $(-4, 3)$. Then the midpoint M can be found as follows.

$$\begin{aligned} M &= \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right) && \text{Midpoint formula} \\ &= \left(\frac{6 + (-4)}{2}, \frac{-7 + 3}{2} \right) && \text{Substitute.} \\ &= (1, -2) && \text{Simplify. } \text{Now Try Exercise 37} \end{aligned}$$

The population of the United States from 1800 to 1990 is shown by the blue curve in Figure 1.20. The red line segment connecting the points $(1800, 5)$ and $(1990, 249)$ does not accurately describe the population over the time period from 1800 to 1990. However, over a shorter time interval this type of line segment may be more accurate.

Figure 1.20 U.S. Population

EXAMPLE 3 Using the midpoint formula

In 1970 the population of the United States was 203 million, and by 1990 it had increased to 249 million. (Source: Bureau of the Census.)

- (a) Use the midpoint formula to estimate the population in 1980.
 (b) Describe this approximation graphically.

SOLUTION

- (a) The U.S. populations in 1970 and 1990 are given by the data points (1970, 203) and (1990, 249). The midpoint M of the line segment connecting these points is

$$M = \left(\frac{1970 + 1990}{2}, \frac{203 + 249}{2} \right) = (1980, 226).$$

The midpoint formula estimates a population of 226 million in 1980. (The actual population was 228 million.)

- (b) Figure 1.21 shows a blue curve for the U.S. population and a red line segment with midpoint M connecting the data points (1970, 203) and (1990, 249). The line segment appears to be an accurate approximation over a relatively short period of 20 years.

Now Try Exercise 33

Figure 1.21 A Linear Approximation

Circles

A **circle** consists of the set of points in a plane that are equidistant from a fixed point. The distance is called the **radius** of the circle, and the fixed point is called the **center**. If we let the center of the circle be (h, k) , the radius be r , and (x, y) be any point on the circle, then the distance between (x, y) and (h, k) must equal r . See Figure 1.22. By the distance formula we have

$$\sqrt{(x - h)^2 + (y - k)^2} = r.$$

Squaring each side gives

$$(x - h)^2 + (y - k)^2 = r^2.$$

Figure 1.22

Standard Equation of a Circle

The circle with center (h, k) and radius r has equation

$$(x - h)^2 + (y - k)^2 = r^2.$$

NOTE If the center of a circle is $(0, 0)$, then the equation simplifies to $x^2 + y^2 = r^2$. For example, the equation of the circle with center $(0, 0)$ and radius 7 is $x^2 + y^2 = 49$.

EXAMPLE 4 Finding the center and radius of a circle

Find the center and radius of the circle with the given equation. Graph each circle.

- (a) $x^2 + y^2 = 9$ (b) $(x - 1)^2 + (y + 2)^2 = 4$

SOLUTION

- (a) Because the equation $x^2 + y^2 = 9$ can be written as $(x - 0)^2 + (y - 0)^2 = 3^2$, the center is $(0, 0)$ and the radius is 3. The graph of this circle is shown in Figure 1.23.
- (b) For $(x - 1)^2 + (y + 2)^2 = 4$, the center is $(1, -2)$ and the radius is 2. The graph is shown in Figure 1.24.

Figure 1.23

Figure 1.24

Now Try Exercises 59 and 63 ◀

EXAMPLE 10 Finding the equation of a circle

Find the equation of the circle that satisfies the conditions. Graph each circle.

- (a) Radius 4, center $(-3, 5)$
- (b) Center $(6, -3)$ with the point $(1, 2)$ on the circle

SOLUTION

- (a) Let $r = 4$ and $(h, k) = (-3, 5)$. The equation of this circle is

$$(x - (-3))^2 + (y - 5)^2 = 4^2 \quad \text{or} \quad (x + 3)^2 + (y - 5)^2 = 16$$

A graph of the circle is shown in Figure 1.25.

- (b) First we must find the distance between the points $(6, -3)$ and $(1, 2)$ to determine r .

$$r = \sqrt{(6 - 1)^2 + (-3 - 2)^2} = \sqrt{50} \approx 7.1$$

Since $r^2 = 50$, the equation of the circle is $(x - 6)^2 + (y + 3)^2 = 50$. Its graph is shown in Figure 1.26.

Figure 1.25

Figure 1.26

Now Try Exercises 71 and 75 ◀

EXAMPLE 11 Finding the equation of a circle

The endpoints of a diameter of a circle are $(-3, 4)$ and $(5, 6)$. Find the standard equation of the circle.

SOLUTION

Getting Started First find the center of the circle, which is the midpoint of a diameter. Then find the radius by calculating the distance between the center and one of the given endpoints of the diameter. ►

Find the center C of the circle by applying the midpoint formula to the endpoints of the diameter $(-3, 4)$ and $(5, 6)$.

$$C = \left(\frac{-3 + 5}{2}, \frac{4 + 6}{2} \right) = (1, 5)$$

Use the distance formula to find the radius, which equals the distance from the center $(1, 5)$ to the endpoint $(5, 6)$.

$$r = \sqrt{(5 - 1)^2 + (6 - 5)^2} = \sqrt{17}$$

Thus r^2 equals **17**, and the standard equation is $(x - 1)^2 + (y - 5)^2 = 17$.

Now Try Exercise 77 ◀

Graphing with a Calculator (Optional)

Graphing calculators can be used to create tables, scatterplots, line graphs, and other types of graphs. The **viewing rectangle**, or **window**, on a graphing calculator is similar to the view finder in a camera. A camera cannot take a picture of an entire scene; it must be centered on a portion of the available scenery and then it can capture different views of the same scene by zooming in and out. Graphing calculators have similar capabilities. The calculator screen can show only a finite, rectangular region of the xy -plane, which is infinite. The viewing rectangle must be specified by setting minimum and maximum values for both the x - and y -axes before a graph can be drawn.

We will use the following terminology to describe a viewing rectangle. **Xmin** is the minimum x -value and **Xmax** is the maximum x -value along the x -axis. Similarly, **Ymin** is the minimum y -value and **Ymax** is the maximum y -value along the y -axis. Most graphs show an x -scale and a y -scale using tick marks on the respective axes. The distance represented by consecutive tick marks on the x -axis is called **Xscl**, and the distance represented by consecutive tick marks on the y -axis is called **Yscl**. See Figure 1.27. This information can be written concisely as **[Xmin, Xmax, Xscl] by [Ymin, Ymax, Yscl]**. For example, **[-10, 10, 1] by [-10, 10, 1]** means that $Xmin = -10$, $Xmax = 10$, $Xscl = 1$, $Ymin = -10$, $Ymax = 10$, and $Yscl = 1$. This setting is referred to as the **standard viewing rectangle**.

Figure 1.27

EXAMPLE 12 Setting the viewing rectangle

Show the standard viewing rectangle and the viewing rectangle given by $[-30, 40, 10]$ by $[-400, 800, 100]$ on your calculator.

SOLUTION The required window settings and viewing rectangles are displayed in Figures 1.28–1.31. Notice that in Figure 1.29, there are 10 tick marks on the positive x -axis, since its length is 10 and the distance between consecutive tick marks is 1.

Calculator Help

To set a viewing rectangle or window, see Appendix A (page AP-3).

Figure 1.28

Now Try Exercise 81

EXAMPLE 13 Making a scatterplot with a graphing calculator

Plot the points $(-5, -5)$, $(-2, 3)$, $(1, -7)$, and $(4, 8)$ in the standard viewing rectangle.

SOLUTION The standard viewing rectangle is given by $[-10, 10, 1]$ by $[-10, 10, 1]$. The points $(-5, -5)$, $(-2, 3)$, $(1, -7)$, and $(4, 8)$ are plotted in Figure 1.32.

Calculator Help

To make the scatterplot in Figure 1.32, see Appendix A (page AP-3).

$[-10, 10, 1]$ by $[-10, 10, 1]$

Figure 1.32

Now Try Exercise 89

EXAMPLE 14 Creating a line graph with a graphing calculator

Table 1.5 lists the percentage of music sales accounted for by compact discs (CDs) from 1990 to 2005. Make a line graph of these sales in $[1988, 2007, 2]$ by $[0, 100, 20]$.

Table 1.5

Year	1990	1995	2000	2005
CDs (% share)	31	65	89	90

Source: Recording Industry Association of America.

SOLUTION Enter the data points (1990, 31), (1995, 65), (2000, 89), and (2005, 90). A line graph can be created by selecting this option on your graphing calculator. The graph is shown in Figure 1.33.

Calculator Help

To make a line graph, see Appendix A (page AP-3).

$[1988, 2007, 2]$ by $[0, 100, 20]$

**Figure 1.33**

Now Try Exercise 93

1.2 Putting It All Together

The following table lists basic concepts in this section.

Concept	Explanation	Examples
Mean, or average	To find the mean, or average, of n numbers, divide their sum by n .	The mean of the four numbers $-3, 5, 6, 9$ is $\frac{-3 + 5 + 6 + 9}{4} = 4.25.$
Median	The median of a sorted list of numbers equals the value that is located in the middle of the list. Half the data are greater than or equal to the median, and half the data are less than or equal to the median.	The median of $2, 3, 6, 9, 11$ is 6 , the middle data item. The median of $2, 3, 6, 9$ is the average of the two middle values: 3 and 6 . Therefore the median is $\frac{3 + 6}{2} = 4.5.$
Relation, domain, and range	A relation is a set of ordered pairs (x, y) . The set of x -values is called the domain, and the set of y -values is called the range.	The relation $S = \{(1, 3), (2, 5), (1, 6)\}$ has domain $D = \{1, 2\}$ and range $R = \{3, 5, 6\}$.

continued on next page

continued from previous page

Concept	Explanation	Examples
Distance formula	The distance between (x_1, y_1) and (x_2, y_2) is $d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}.$	The distance between $(2, -1)$ and $(-1, 3)$ is $d = \sqrt{(-1 - 2)^2 + (3 - (-1))^2} = 5.$
Midpoint formula	The midpoint of the line segment connecting (x_1, y_1) and (x_2, y_2) is $M = \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right).$	The midpoint of the line segment connecting $(4, 3)$ and $(-2, 5)$ is $M = \left(\frac{4 + (-2)}{2}, \frac{3 + 5}{2} \right) = (1, 4).$
Standard equation of a circle	The circle with center (h, k) and radius r has the equation $(x - h)^2 + (y - k)^2 = r^2.$	The circle with center $(-3, 4)$ and radius 5 has the equation $(x + 3)^2 + (y - 4)^2 = 25.$

The next table summarizes some basic concepts related to one-variable and two-variable data.

Type of Data	Methods of Visualization	Comments
One-variable data	Number line, list, one-column or one-row table	The data items are the same type and can be described using x -values. Computations of the mean and median are performed on one-variable data.
Two-variable data	Two-column or two-row table, scatter-plot, line graph or other type of graph in the xy -plane	Two types of data are related and can be described by using ordered pairs (x, y) .

1.2 Exercises

Data Involving One Variable

Exercises 1–4: For the table of data, complete the following.

- (a) Plot the numbers on a number line.
- (b) Find the maximum and minimum of the data.
- (c) Determine the mean of the data.

- 1. 3 -2 5 0 6 -1
- 2. -5 -3 4 -2 1 6
- 3. -10 -20 30 -20 0 10
- 4. 0.5 -1.5 2.0 4.5 -3.5 -1.0

Exercises 5–8: Sort the list of numbers from smallest to largest and display the result in a table.

- (a) Determine the maximum and minimum values.
- (b) Calculate the mean and median. Round each result to the nearest hundredth when appropriate.

- 5. -10, 25, 15, -30, 55, 61, -30, 45, 5
- 6. -1.25, 4.75, -3.5, 1.5, 2.5, 4.75, 1.5
- 7. $\sqrt{15}$, $2^{2.3}$, $\sqrt[3]{69}$, π^2 , 2^π , 4.1
- 8. $\frac{22}{7}$, 3.14, $\sqrt[3]{28}$, $\sqrt{9.4}$, $4^{0.9}$, $3^{1.2}$

Exercises 9 and 10: Geography The set of numbers contains data about geographic features of the world.

- Plot the numbers on a number line.
 - Calculate the mean and median for the set of numbers. Interpret your results.
 - Try to identify the geographic feature associated with the largest number in the set.
- {31.7, 22.3, 12.3, 26.8, 24.9, 23.0} (Areas of largest freshwater lakes in thousands of square miles) (Source: U.S. National Oceanic and Atmospheric Administration.)
 - {19.3, 18.5, 29.0, 7.31, 16.1, 22.8, 20.3} (Highest elevations of the continents in thousands of feet) (Source: National Geographic Atlas of the World.)
 - Designing a Data Set** Find a set of three numbers with a mean of 20 and a median of 18. Is your answer unique?
 - Designing a Data Set** Find a set of five numbers with a mean of 10 and a median of 9. Is your answer unique?

Distance Formula

Exercises 13–28: Find the exact distance between the two points. Where appropriate, also give approximate results to the nearest hundredth.

- (2, -2), (5, 2)
- (7, -4), (9, 1)
- (3.6, 5.7), (-2.1, 8.7)
- (-3, 2), (-3, 10)
- $(\frac{1}{2}, -\frac{1}{2}), (\frac{3}{4}, \frac{1}{2})$
- $(\frac{2}{5}, \frac{3}{10}), (-\frac{1}{10}, \frac{4}{5})$
- (20, 30), (-30, -90)
- (a, 0), (0, -b)
- (2, -2), (5, 2)
- (-1, -6), (-8, -5)
- (-6.5, 2.7), (3.6, -2.9)
- (7, 9), (-1, 9)
- $(-\frac{1}{3}, \frac{2}{3}), (\frac{1}{3}, -\frac{4}{3})$
- $(-\frac{1}{2}, \frac{2}{3}), (\frac{1}{3}, -\frac{5}{2})$
- (40, 6), (-20, 17)
- (x, y), (1, 2)
- Geometry** An isosceles triangle has at least two sides of equal length. Determine whether the triangle with vertices (0, 0), (3, 4), (7, 1) is isosceles.
- Geometry** An equilateral triangle has sides of equal length. Determine whether the triangle with vertices (-1, -1), (2, 3), (-4, 3) is equilateral.

- Distance between Cars** (Refer to Example 6.) At 9:00 A.M. car A is traveling north at 50 miles per hour and is located 50 miles south of car B. Car B is traveling west at 20 miles per hour.

- Let (0, 0) be the initial coordinates of car B in the xy -plane, where units are in miles. Plot the locations of each car at 9:00 A.M. and at 11:00 A.M.

- Find the distance d between the cars at 11:00 A.M.

- Distance between Ships** Two ships leave a harbor at the same time. The first ship heads north at 20 miles per hour, and the second ship heads west at 15 miles per hour. Write an expression that gives the distance d between the ships after t hours.

Midpoint Formula

Exercises 33–36: Use the midpoint formula for the following.

- U.S. Average Life Expectancy** The average life expectancy for a female born in the United States was 77.4 years in 1980 and 79.5 years in 2000. Estimate the average life expectancy for a female born in 1990. (Actual life expectancy was 78.8.) (Source: Bureau of the Census.)
- State and Federal Inmates** In 1990 there were 773,919 inmates in state and federal prisons, and in 2000 there were 1,391,892. Estimate the number of inmates in 1995. (Actual number was 1,125,874.) (Source: Department of Justice.)
- Olympic Times** In the Olympic Games, the 200-meter dash is run in approximately 20 seconds. Estimate the time to run the 100-meter dash.

- Real Numbers** Between any two real numbers a and b there is always another real number. How could such a number be found?

Exercises 37–46: Find the midpoint of the line segment connecting the points.

- (1, 2), (5, -3)
- (-30, 50), (50, -30)
- (-6, 7), (9, -4)
- (28, -33), (52, 38)

41. $(1.5, 2.9), (-5.7, -3.6)$ 42. $(9.4, -4.5), (-7.7, 9.5)$
 43. $(\sqrt{2}, \sqrt{5}), (\sqrt{2}, -\sqrt{5})$ 44. $(\sqrt{7}, 3\sqrt{3}), (-\sqrt{7}, -\sqrt{3})$
 45. $(a, b), (-a, 3b)$ 46. $(-a, b), (3a, b)$

Data Involving Two Variables

Exercises 47–50: For the table of data, complete the following.

- (a) Express the data as a relation S .
 (b) Find the domain and range of S .

47.

x	-1	2	3	5	9
y	5	2	-1	-4	-5

48.

x	-2	0	2	4	6
y	-4	-2	-1	0	4

49.

x	1	4	5	4	1
y	5	5	6	6	5

50.

x	-1	0	3	-1	-2
y	$\frac{1}{2}$	1	$\frac{3}{4}$	3	$-\frac{5}{6}$

Exercises 51–56: Complete the following.

- (a) Find the domain and range of the relation.
 (b) Determine the maximum and minimum of the x -values and then of the y -values.
 (c) Label appropriate scales on the xy -axes.
 (d) Plot the relation.
51. $\{(0, 5), (-3, 4), (-2, -5), (7, -3), (0, 0)\}$
 52. $\{(1, 1), (3, 0), (-5, -5), (8, -2), (0, 3)\}$
 53. $\{(2, 2), (-3, 1), (-4, -1), (-1, 3), (0, -2)\}$
 54. $\{(1, 1), (2, -3), (-1, -1), (-1, 2), (-1, 0)\}$
 55. $\{(10, 50), (-35, 45), (0, -55), (75, 25), (-25, -25)\}$
 56. $\{(-1.2, 1.5), (1.0, 0.5), (-0.3, 1.1), (-0.8, -1.3)\}$

Exercises 57 and 58: **Plotting Real Data** Use the table to make a scatterplot and line graph of the data.

57. Cell phone subscribers (millions)

Year	1958	1975	1990	2005
CO ₂ amounts	315	335	355	380

Source: Mauna Loa Observatory.

Circles

Exercises 59–66: Find the center and radius of the circle.

59. $x^2 + y^2 = 25$ 60. $x^2 + y^2 = 100$
 61. $x^2 + y^2 = 7$ 62. $x^2 + y^2 = 20$
 63. $(x - 2)^2 + (y + 3)^2 = 9$
 64. $(x + 1)^2 + (y - 1)^2 = 16$
 65. $x^2 + (y + 1)^2 = 100$ 66. $(x - 5)^2 + y^2 = 19$

Exercises 67–70: Find the standard equation of the circle.

Exercises 71–78: Find the standard equation of a circle that satisfies the conditions.

71. Radius 8, center $(3, -5)$
 72. Radius 5, center $(-1, 4)$
 73. Radius 7, center $(3, 0)$ 74. Radius 1, center $(0, 0)$
 75. Center $(0, 0)$ with the point $(-3, -1)$ on the circle

76. Center $(3, -5)$ with the point $(4, 2)$ on the circle
77. Endpoints of a diameter $(-5, -7)$ and $(1, 1)$
78. Endpoints of a diameter $(-3, -2)$ and $(1, -4)$

Graphing Calculators

 Exercises 79–84: Predict the number of tick marks on the positive x -axis and the positive y -axis. Then show the viewing rectangle on your graphing calculator.

79. Standard viewing rectangle
80. $[-4.7, 4.7, 1]$ by $[-3.1, 3.1, 1]$
81. $[0, 100, 10]$ by $[-50, 50, 10]$
82. $[-30, 30, 5]$ by $[-20, 20, 5]$
83. $[1980, 1995, 1]$ by $[12000, 16000, 1000]$
84. $[1800, 2000, 20]$ by $[5, 20, 5]$

Exercises 85–88: Match the settings for a viewing rectangle with the correct figure (a–d).

85. $[-9, 9, 1]$ by $[-6, 6, 1]$
86. $[-6, 6, 1]$ by $[-9, 9, 1]$
87. $[-2, 2, 0.5]$ by $[-4.5, 4.5, 0.5]$
88. $[-4, 8, 1]$ by $[-600, 600, 100]$

a.

b.

c.

d.

Exercises 89–92: Make a scatterplot of the relation.

89. $\{(1, 3), (-2, 2), (-4, 1), (-2, -4), (0, 2)\}$
90. $\{(6, 8), (-4, -10), (-2, -6), (2, -5)\}$

91. $\{(10, -20), (-40, 50), (30, 60), (-50, -80), (70, 0)\}$
92. $\{(-1.2, 0.6), (1.0, -0.5), (0.4, 0.2), (-2.8, 1.4)\}$

 Exercises 93–96: The table contains real data.

- (a) Determine the maximum and minimum values for each variable in the table.
- (b) Use your results from part (a) to find an appropriate viewing rectangle.
- (c) Make a scatterplot of the data.
- (d) Make a line graph of the data.

93. Digital subscriber lines (millions)

Year	2005	2006	2007	2008
DSL users	19.7	22.0	23.7	25.0

Writing about Mathematics

97. Give an example of a relation that has meaning in the real world. Give an example of an ordered pair (x, y) that is in your relation. Does the ordered pair (y, x) also have meaning? Explain your answers.
98. Do the mean and median represent the same thing? Explain your answer and give an example.

CHECKING BASIC CONCEPTS FOR SECTIONS 1.1 AND 1.2

- Approximate each expression to the nearest hundredth.
(a) $\sqrt{4.2(23.1 + 0.5^3)}$ (b) $\frac{23 + 44}{85.1 - 32.9}$
- Evaluate the expression by hand.
(a) $5 - (-4)^2 \cdot 3$ (b) $5 \div 5\sqrt{2 + 2}$
- Write each number using scientific notation.
(a) 348,500,000 (b) -1237.4
(c) 0.00198
- Find the exact distance between the points $(-3, 1)$ and $(3, -5)$. Then round this distance to the nearest hundredth.
- Find the midpoint of the line segment connecting the points $(-2, 3)$ and $(4, 2)$.
- Find the standard equation of a circle with center $(-4, 5)$ and radius 8.
- The average depths in feet of the four oceans are 13,215, 12,881, 13,002, and 3953. Calculate the mean and median of these depths.
- Make a scatterplot and a line graph with the four points $(-5, -4)$, $(-1, 2)$, $(2, -2)$, and $(3, 6)$. State the quadrant in which each point lies.

1.3 Functions and Their Representations

- Learn function notation
- Represent a function four different ways
- Define a function formally
- Identify the domain and range of a function
- Use calculators to represent functions (optional)
- Identify functions
- Represent functions with diagrams and equations

Introduction

Because there are more than 300 million people in the United States who consume many natural resources, *going green* has become an important social and environmental issue. Collectively, we affect the world around us. The average person uses 2200 paper napkins a year. A washing machine uses about 40 gallons of water for each load of clothes, and a car puts 19.4 pounds of carbon dioxide into the atmosphere every time it burns a gallon of gasoline. See Exercises 99 and 100.

The mathematical concept of a function includes formulas, graphs, tables, and verbal descriptions. All of these representations can be used to analyze the impact of human consumption on the environment and also to describe natural phenomena, such as lightning. This section introduces the important concept of a function, which is used throughout the course.

Basic Concepts

Although thunder is caused by lightning, we sometimes see a flash of lightning before we hear the thunder. This is because light travels at 186,000 *miles* per second, whereas sound travels at about 1050 *feet* per second. Since 1 mile equals 5280 feet, sound takes about 5 seconds to travel 1 mile. It follows that the farther away lightning is, the greater the time lapse between seeing the flash of lightning and hearing the thunder. Table 1.6 lists the *approximate* distance y in miles between a person and a bolt of lightning when there is a time lapse of x seconds between seeing the lightning and hearing the thunder. Note that the value of y can be found by dividing the corresponding value of x by 5.

Table 1.6 Distance from Lightning

x (seconds)	5	10	15	20	25
y (miles)	1	2	3	4	5

This table establishes a special type of relation between two sets of numbers, where each valid input x in seconds determines *exactly one* output y in miles. We say that Table 1.6 *represents* or *defines* a function f , where function f *computes* the distance between an observer and a lightning bolt.

To emphasize that y is a function of x , the notation $y = f(x)$ is used. The expression $f(x)$ does *not* indicate that f and x are multiplied. Rather, the notation $y = f(x)$, called *function notation*, is read “ y equals f of x ” and denotes that function f with input x produces output y . That is,

$$f(\text{Input}) = \text{Output},$$

where the input is in seconds and the output is in miles. For example, we write $f(5) = 1$ because if there is a 5-second delay between a lightning bolt and its thunder, then the lightning bolt was about 1 mile away. The expression $f(5)$ represents the output from f when the input is 5. Similarly, $f(10) = 2$ and $f(15) = 3$. Note that a function calculates a set of ordered pairs (x, y) , where $y = f(x)$. For example, the ordered pairs $(5, 1)$, $(10, 2)$, and $(15, 3)$ all belong to the relation computed by f . We can think of these ordered pairs as input-output pairs with the form **(input, output)**.

The distance y *depends* on the time x , and so y is called the *dependent variable* and x is called the *independent variable*. For example, if we pick the independent variable x to be 10 seconds, then the value of y equals $\frac{10}{5} = 2$ miles. The y -values depend on the x -values that we choose. The following diagram will help you visualize the computation performed by f .

This discussion about function notation is summarized as follows.

Function Notation

The notation $y = f(x)$ is called **function notation**. The **input** is x , the **output** is y , and the *name* of the function is f .

The variable y is called the **dependent variable**, and the variable x is called the **independent variable**. The expression $f(20) = 4$ is read “ f of 20 equals 4” and indicates that f outputs 4 when the input is 20. A function computes *exactly one* output for each valid input. The letters f , g , and h are often used to denote names of functions.

NOTE In addition to calculating the distance to a lightning bolt, functions can be used to compute many different types of quantities, such as sales tax or drug dosages. However, every function is a *relation* that calculates *exactly one* output for each valid input.

The set of valid or meaningful inputs x is called the **domain** of the function, and the set of corresponding outputs y is the **range**. For example, suppose that a function f computes the height after x seconds of a ball thrown into the air. Then the domain of f might consist of all times while the ball was in flight, and the range would include all heights attained by the ball.

The following operations can be carried out by functions because they result in *one* output for each valid input.

- Calculating the square of a number x
- Finding the sale price when an item with regular price x is discounted 25%
- Naming the biological mother of person x

Not all computations can be done by functions. Suppose that we were given an eye color as an input and asked to output the name of each person in the class having this eye color. Typically we would *not* be computing a function. If, for example, several people in the class had brown eyes, there would not be a unique output (name) for each input (eye color).

MAKING CONNECTIONS

The Expressions f and $f(x)$ The italic letter f represents the *name* of a function, whereas the expression $f(x)$ represents the function f evaluated for input x . That is, $f(x)$ typically represents a formula for function f that can be used to evaluate f for various values of x . For example, if f represents the name of the squaring function, then $f(x) = x^2$. Thus we speak of the graph of f or the domain of f , but we evaluate $f(3)$ to be $3^2 = 9$.

Representations of Functions

Functions can be represented by verbal descriptions, tables, symbols, and graphs.

Verbal Representation (Words) If function f gives the distance between an observer and a bolt of lightning, then we can verbally describe f with the following sentence: “Divide x seconds by 5 to obtain y miles.” We call this a **verbal representation** of f .

Sometimes when the computation performed by a function has meaning, we can describe this computation verbally. For example, another verbal representation of function f is “ f calculates the number of miles from a lightning bolt when the delay between thunder and lightning is x seconds.”

Numerical Representation (Table of Values) Table 1.6 gave a numerical representation for the function f that calculates the distance between a lightning bolt and an observer. A **numerical representation** is a *table of values* that lists input-output pairs for a function. A different numerical representation for f is shown in Table 1.7.

Table 1.7 Distance from a Bolt of Lightning

x (seconds)	1	2	3	4	5	6	7
y (miles)	0.2	0.4	0.6	0.8	1.0	1.2	1.4

One difficulty with numerical representations is that it is often either inconvenient or impossible to list all possible inputs x . For this reason we sometimes refer to a table of this type as a **partial numerical representation** as opposed to a **complete numerical representation**, which would include all elements from the domain of a function. For example, many valid inputs do not appear in Table 1.7, such as $x = 11$ or $x = 0.75$.

Some tables do not represent a function. For example, Table 1.8 represents a relation but *not a function* because input **1** produces two outputs, **3** and **12**.

Table 1.8 A Relation That Is Not a Function

x	1	2	3	1
y	3	6	9	12

Symbolic Representation (Formula) A formula gives a **symbolic representation** of a function. The computation performed by f is expressed by $f(x) = \frac{x}{5}$, where $y = f(x)$. We say that function f is *represented by*, *defined by*, or *given by* $f(x) = \frac{x}{5}$. It follows that $f(6) = \frac{6}{5} = 1.2$.

Similarly, if a function g computes the square of a number x , then g is represented by $g(x) = x^2$. A formula is an efficient, but less visual, way to define a function.

Graphical Representation (Graph) Leonhard Euler (1707–1783) invented the function notation $f(x)$. He also was the first to allow a function to be represented by a graph, rather than only by a formula.

A **graphical representation**, or **graph**, visually pairs an x -input with a y -output. In a graph of a function, the ordered pairs (x, y) are plotted in the xy -plane. The ordered pairs

$(1, 0.2), (2, 0.4), (3, 0.6), (4, 0.8), (5, 1.0), (6, 1.2),$ and $(7, 1.4)$

from Table 1.7 are plotted in Figure 1.34. This scatterplot suggests a line for the graph of f , as shown in Figure 1.35.

Figure 1.34

Figure 1.35

Note that since $f(5) = 1$, the point $(5, 1)$ lies on the graph of f . Similarly, since $(7, 1.4)$ lies on the graph of f , it follows that $f(7) = 1.4$.

MAKING CONNECTIONS

Functions, Points, and Graphs If $f(a) = b$, then the point (a, b) lies on the graph of f . Conversely, if the point (a, b) lies on the graph of f , then $f(a) = b$. Thus each point on the graph of f can be written in the form $(a, f(a))$.

EXAMPLE 1 Graphing the absolute value function by handGraph $f(x) = |x|$ by hand.**SOLUTION**

Getting Started Unless you already know what the graph of a given function looks like, a good technique to use when graphing by hand is to first make a table of values. Then plot the points in the table and sketch a smooth curve (or line) between these points. ▶

Start by selecting convenient x -values and then substitute them into $f(x) = |x|$, as shown in Table 1.9. For example, when $x = -2$, then $f(-2) = |-2| = 2$, so the point $(-2, 2)$ is located on the graph of $y = f(x)$.

Next, plot the points $(-2, 2)$, $(-1, 1)$, $(0, 0)$, $(1, 1)$, and $(2, 2)$ in the xy -plane, as shown in Figure 1.36. The points appear to be V-shaped, and the graph of f shown in Figure 1.37 results if all possible real number ordered pairs $(x, |x|)$ are plotted.

Table 1.9

2	5

Graphical Representation

Verbal Representation f squares input x and then adds 1 to produce output y .

Although there are *many* ways to represent a function, there is no *best* representation. Sometimes a formula works best—other times a graph or a table is preferable.

Formal Definition of a Function

Because the idea of a function is a fundamental concept in mathematics, it is important that we define a function precisely. This definition should allow for *all* representations of a function. The commonality among representations is the concept of an ordered pair. A relation is a set of ordered pairs, and a function is a special type of relation.

Function

A **function** is a relation in which *each* element in the domain corresponds to *exactly one* element in the range.

The set of ordered pairs for a function can be either finite or infinite. The function represented by $f = \{(1, 2), (3, 4), (5, 6)\}$ is a finite set of ordered pairs. In contrast, the function represented by $g(x) = x^2$ with all real numbers as its domain generates an infinite set of ordered pairs (x, x^2) . Examples include $(1, 1)$, $(2, 4)$, and $(2.5, 6.25)$.

EXAMPLE 3

Computing median income as a function of educational attainment

The function f computes median 2004 individual annual earnings for males (in dollars) by educational attainment. This function is defined by $f(N) = 26,277$; $f(H) = 35,725$; $f(B) = 57,220$; $f(M) = 71,530$, where N denotes no diploma, H a high school diploma, B a bachelor's degree, and M a master's degree. (Source: *Digest of Education Statistics*, 2005.)

- Write f as a set of ordered pairs.
- Give the domain and range of f .
- Discuss the relationship between education and income.

SOLUTION

- $f = \{(N, 26277), (H, 35725), (B, 57220), (M, 71530)\}$.
- The domain D and range R of f are

$$D = \{N, H, B, M\} \quad \text{and} \quad R = \{26277, 35725, 57220, 71530\}.$$

- In general, the greater the educational attainment, the greater the annual earnings.

Now Try Exercise 97

CLASS DISCUSSION

Suppose a golf ball hit into the air reaches a maximum height of 144 feet and strikes the ground after 6 seconds. Let f be a function that computes the height y (in feet) after x seconds. Describe the domain and range of f .

MAKING CONNECTIONS

Relations and Functions Every function is a relation, whereas not every relation is a function. A function has exactly one output for each valid input.

Unless stated otherwise, the domain of a function f is the set of all *real* numbers for which its symbolic representation (formula) is defined. The domain can be thought of as the set of all valid inputs that make sense in the expression for $f(x)$. In this case the domain is often referred to as the **implied domain**. Other times the domain of a function must be restricted. For example, if an object falls for 5 seconds, then the distance d that it has fallen in feet after t seconds is given by $d(t) = 16t^2$ and the domain of d must be restricted to $0 \leq t \leq 5$.

NOTE When a function involves a square root, such as $f(x) = \sqrt{x}$, we assume that the output must be a real number. Thus the implied domain of f is the set of real numbers greater than or equal to 0, because the square root of a negative number is not a real number.

EXAMPLE 1 Evaluating a function and determining its domain

Let a function f be represented symbolically by $f(x) = \frac{x}{x^2 - 1}$.

- (a) Evaluate $f(3)$ and $f(a + 1)$. (b) Find the domain of f .

SOLUTION

- (a) To evaluate $f(3)$, substitute 3 for x in the formula: $f(3) = \frac{3}{3^2 - 1} = \frac{3}{8}$.
To evaluate $f(a + 1)$, substitute $(a + 1)$ for x in the formula for $f(x)$.

$$\begin{aligned} f(a + 1) &= \frac{(a + 1)}{(a + 1)^2 - 1} && \text{Let } x = (a + 1). \\ &= \frac{a + 1}{a^2 + 2a + 1 - 1} && \text{Square the binomial} \\ &= \frac{a + 1}{a^2 + 2a} && \text{Simplify.} \end{aligned}$$

- (b) The expression for $f(x)$ is not defined when the denominator $x^2 - 1 = 0$. Because $(1)^2 - 1 = 0$ and $(-1)^2 - 1 = 0$, the domain of f is all real numbers except for -1 and 1 . The domain can be expressed in *set-builder notation* as $\{x | x \neq -1, x \neq 1\}$.

Now Try Exercise 31 ◀

Set-Builder Notation

The expression $\{x | x \neq -1, x \neq 1\}$ is written in **set-builder notation** and represents the set of all real numbers x such that x does not equal -1 and x does not equal 1 . Another example is $\{y | 1 < y < 5\}$, which represents the set of all real numbers y such that y is greater than 1 and less than 5 .

Figure 1.38

Figure 1.39 $g(-1) = 3$

EXAMPLE 2 Evaluating a function symbolically and graphically

A function g is given by $g(x) = x^2 - 2x$, and its graph is shown in Figure 1.38.

- (a) Find the domain of g .
(b) Use $g(x)$ to evaluate $g(-1)$.
(c) Use the graph of g to evaluate $g(-1)$.

SOLUTION

- (a) The domain for $g(x) = x^2 - 2x$ includes all real numbers because the formula is defined for all real number inputs x .
(b) To evaluate $g(-1)$, substitute -1 for x in $g(x) = x^2 - 2x$.

$$g(-1) = (-1)^2 - 2(-1) = 1 + 2 = 3$$

- (c) Refer to Figure 1.39. Begin by finding $x = -1$ on the x -axis. Move upward until the graph of g is reached. Then move across to the y -axis. The y -value corresponding to an x -value of -1 is 3 . Thus $g(-1) = 3$.

Now Try Exercise 37 ◀

Algebra Review

To square a binomial, see Chapter R (page R-18).

EXAMPLE 1 Finding the domain and range graphically

A graph of $f(x) = \sqrt{x - 2}$ is shown in Figure 1.40. Find the domain and range of f .

Figure 1.40

Figure 1.41

SOLUTION The arrow in the graph of f indicates that both the x -values and the y -values increase without reaching a maximum value. In Figure 1.41 the domain and range of f have been labeled by an arrow on each axis. Note that points appear on the graph for all x greater than or equal to 2. Thus the domain is $D = \{x \mid x \geq 2\}$. The minimum y -value on the graph of f is 0 and it occurs at the point $(2, 0)$. There is no maximum y -value on the graph, so the range is $R = \{y \mid y \geq 0\}$.

Now Try Exercise 45 ◀

Graphing Calculators and Functions (Optional)

Graphing calculators can be used to create graphs and tables of a function—usually more efficiently and reliably than pencil-and-paper techniques. However, a graphing calculator uses the same basic method that we might use to draw a graph. For example, one way to sketch a graph of $y = x^2$ is to first make a table of values, such as Table 1.10.

Table 1.10

x	-3	-2	-1	0	1	2	3
y	9	4	1	0	1	4	9

We can plot these points in the xy -plane, as shown in Figure 1.42. Next we might connect the points with a smooth curve, as shown in Figure 1.43. A graphing calculator typically plots numerous points and connects them to make a graph. In Figure 1.44, a graphing calculator has been used to graph $y = x^2$.

Figure 1.42

Figure 1.43

$[-5, 5, 1]$ by $[-1, 10, 1]$

Figure 1.44

An Application In the next example we use a graphing calculator to represent a function that computes the decrease in air temperature as altitude increases.

EXAMPLE 6 Representing a function

When the relative humidity is less than 100%, air cools at a rate of 3.6°F for every 1000-foot increase in altitude. Give verbal, symbolic, graphical, and numerical representations of a function f that computes this change in temperature for an increase in altitude of x thousand feet. Let the domain of f be $0 \leq x \leq 6$. (Source: L. Battan, *Weather in Your Life*.)

SOLUTION

Verbal Multiply the input x by -3.6 to obtain the change y in temperature.

Symbolic Let $f(x) = -3.6x$.

Graphical Since $f(x) = -3.6x$, enter $Y_1 = -3.6X$, as shown in Figure 1.45. Graph y_1 in a viewing rectangle such as $[0, 6, 1]$ by $[-25, 10, 5]$, used in Figure 1.46.

Calculator Help

To enter a formula and create a graph, see Appendix A (pages AP-4 and AP-5).

Figure 1.45

$[0, 6, 1]$ by $[-25, 10, 5]$

Figure 1.46

Numerical It is impossible to list all inputs x , since $0 \leq x \leq 6$. However, Figures 1.47 and 1.48 show how to create a table for $Y_1 = -3.6X$ with $x = 0, 1, 2, 3, 4, 5, 6$. Other values for x in the domain of f are possible.

Calculator Help

To create a table similar to Figure 1.48, see Appendix A (page AP-6).

Figure 1.47

Figure 1.48

Now Try Exercise 101 ◀

NOTE Each of the four representations presented in Example 6 represent the *same* function f .

An Application Each year approximately 15 million people visit the doctor with foot, toe, and ankle problems. In the next example we use a graphing calculator to evaluate a function that computes the proper crutch length for some of these people.

EXAMPLE 7 Evaluating representations of a function

People who sustain leg injuries often require crutches. The formula $f(x) = 0.72x + 2$ computes the appropriate crutch length in inches for a person with a height of x inches.

(Source: *Journal of the American Physical Therapy Association*.)

- Evaluate $f(65)$ symbolically. Interpret your result.
- Evaluate $f(65)$ graphically. Use the window $[60, 90, 10]$ by $[40, 80, 10]$.
- Make a table of f starting at $x = 60$ and incrementing by 1. Evaluate $f(65)$.

**SOLUTION**

- Symbolically** Since $f(x) = 0.72x + 2$, $f(65) = 0.72(65) + 2 = 48.8$. This result means that a person 65 inches tall needs about 49-inch crutches.
- Graphically** Begin by graphing $Y_1 = 0.72X + 2$, as shown in Figure 1.49. Two ways to evaluate a function with a graphing calculator are to use either the “trace” or the “value” utility. The “value” utility is sometimes found under the CALCULATE menu. In Figures 1.50 and 1.51 this utility has been used to evaluate the graph at $x = 65$ to obtain 48.8.

Calculator Help

To make a graph and evaluate a function graphically, see Appendix A (page AP-5).

$[60, 90, 10]$ by $[40, 80, 10]$

Figure 1.49

CALCULATE

1:value
2:zero
3:minimum
4:maximum
5:intersect
6:dy/dx
7:f(x)dx

Figure 1.50

$[60, 90, 10]$ by $[40, 80, 10]$

Figure 1.51

- Numerically** To create a table on a graphing calculator, we retain the formula for y_1 and specify both the *starting value* for x (TblStart) and the *increment* between successive x -values (ΔTbl). Here we start the table at $x = 60$ and increment by 1. (There is no viewing rectangle to set.) Figures 1.52 and 1.53 illustrate these steps. When $x = 65$, $y = 48.8$, so $f(65) = 48.8$.

Calculator Help

To create the table in Figure 1.53, see Appendix A (page AP-6).

TABLE SETUP
TblStart=60
 $\Delta Tbl=1$
Indpnt: Auto Ask
Depend: Auto Ask

Figure 1.52

X	Y1
60	45.2
61	45.92
62	46.64
63	47.36
64	48.08
65	48.8 ← $f(65) = 48.8$
66	49.52
$Y1 = 0.72X + 2$	

Figure 1.53

Now Try Exercise 57

NOTE Regardless of the representation that we use to evaluate a function, the results should be equal. However, when we estimate from a graph, sometimes the result will be an approximation of the true value.

Identifying Functions

A function is a special type of relation where each valid input (x -value) produces exactly one output (y -value). We can use this concept to identify functions.

EXAMPLE 2 Determining if a set of ordered pairs is a function

Determine if each set of ordered pairs represents a function.

- (a) $A = \{(-2, 3), (-1, 2), (0, -3), (-2, 4)\}$
 (b) $B = \{(1, 4), (2, 5), (-3, -4), (-1, 7), (0, 4)\}$

SOLUTION

- (a) Set A does not represent a function because input -2 results in two outputs: 3 and 4 .
 (b) Inputs 1 and 0 have the same output 4 . However, set B represents a function because each input (x -value) results in one output (y -value). **Now Try Exercises 77 and 79** ◀

Figure 1.54

Figure 1.55

Vertical Line Test To conclude that a graph represents a function, we must be convinced that it is impossible for two distinct points with the same x -coordinate to lie on the graph. For example, the ordered pairs $(4, 2)$ and $(4, -2)$ are distinct points with the same x -coordinate. These two points could not lie on the graph of the same function because input 4 would result in two outputs: 2 and -2 . When the points $(4, 2)$ and $(4, -2)$ are plotted, they lie on the same vertical line, as shown in Figure 1.54. A graph passing through these points intersects the line twice, as illustrated in Figure 1.55. Therefore the graph in Figure 1.55 does *not* represent a function.

To determine if a graph represents a function, simply visualize vertical lines in the xy -plane. If every vertical line intersects a graph at no more than one point, then it is a graph of a function. This procedure is called the **vertical line test** for a function.

Vertical Line Test

If every vertical line intersects a graph at no more than one point, then the graph represents a function.

NOTE If a vertical line intersects a graph more than once, then the graph does *not* represent a function.

EXAMPLE 3 Identifying a function graphically

Use the vertical line test to determine if the graph represents a function.

Figure 1.56

Figure 1.57

SOLUTION

- (a) Note in Figure 1.56 that every vertical line that could be visualized would intersect the graph at most once. Therefore the graph represents a function.
- (b) The graph in Figure 1.57 does not represent a function because it is possible for a vertical line to intersect the graph more than once.

Now Try Exercises 65 and 67 ◀

Functions Represented by Diagrams and Equations

Thus far we have discussed four representations of a function: verbal, numerical, symbolic, and graphical. Two other ways that we can represent, or define, a function are with diagrams and equations.

Diagrammatic Representation (Diagram) Functions are sometimes represented using **diagrammatic representations**, or **diagrams**. Figure 1.58 is a diagram of a function with domain $D = \{5, 10, 15, 20\}$ and range $R = \{1, 2, 3, 4\}$. An arrow is used to show that input x produces output y . For example, input 5 results in output 1, or $f(5) = 1$. Figure 1.59 shows a relation, but not a function, because input 2 results in two different outputs: 5 and 6.

Figure 1.58 Function

Figure 1.59 Not a Function

NOTE Functions are sometimes referred to as **mappings** between the domain and the range. If $f(5) = 1$, then we say that the range value **1** is the **image** of **5** and that the domain value **5** is the **preimage** of **1**.

Functions Defined by Equations Equations can sometimes define functions. For example, the equation $x + y = 1$ defines a function f given by $f(x) = 1 - x$, where $y = f(x)$. Notice that for each input x , there is exactly one y output determined by $y = 1 - x$. In Figure 1.60 the graph passes the vertical line test. However, the graph of the equation $x^2 + y^2 = 4$ is a circle with center $(0, 0)$ and radius 2. Because a circle does not pass the vertical line test, this equation does not represent a function. See Figure 1.61.

Figure 1.60 Function

Figure 1.61 Not a Function

EXAMPLE TO Identifying a functionDetermine if y is a function of x .

(a) $x = y^2$ (b) $y = x^2 - 2$

SOLUTION

- (a) For y to be a function of x in the equation $x = y^2$, each valid x -value must result in one y -value. If we let $x = 4$, then y could be either -2 or 2 since

$$4 = (-2)^2 \quad \text{and} \quad 4 = (2)^2.$$

Therefore y is not a function of x . A graph of $x = y^2$ is shown in Figure 1.62. Note that this graph fails the vertical line test.

- (b) In the equation $y = x^2 - 2$ each x -value determines exactly one y -value, and so y is a function of x . A graph of this equation is shown in Figure 1.63. This graph passes the vertical line test.

Figure 1.62

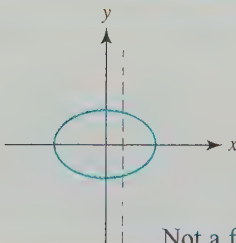

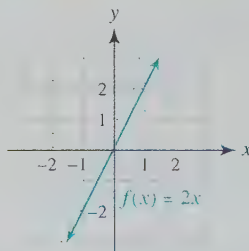

Figure 1.63

Now Try Exercises 83 and 89

1.3 Putting It All Together

The following table summarizes some important topics from this section.

Concept	Explanation	Examples
Function	A function is a <i>relation</i> in which each valid input results in one output. The <i>domain</i> of a function is the set of valid inputs (x -values), and the <i>range</i> is the set of resulting outputs (y -values).	$f = \{(1, 3), (2, 6), (3, 9), (4, 12)\}$ The domain is $D = \{1, 2, 3, 4\}$, and the range is $R = \{3, 6, 9, 12\}$.
Domain	When a function is represented by a formula, its domain, unless otherwise stated, is the set of all valid inputs (x -values) that are defined or make sense in the formula.	$f(x) = \frac{1}{\sqrt{x+4}}$ Domain of f : $\{x x > -4\}$

Concept	Explanation	Examples										
Identifying graphs of functions	<i>Vertical Line Test:</i> If every vertical line intersects a graph at no more than one point, then the graph represents a function. (Otherwise the graph does not represent a function.)	 Not a function										
Verbal representation of a function	Words describe precisely what is computed.	A verbal representation of $f(x) = x^2$ is “Square the input x to obtain the output.”										
Symbolic representation of a function	Mathematical formula	The squaring function is given by $f(x) = x^2$, and the square root function is given by $g(x) = \sqrt{x}$.										
Numerical representation of a function	Table of values	A <i>partial</i> numerical representation of $f(x) = 3x$ is shown. <table data-bbox="1078 838 1351 922"><tr><td>x</td><td>0</td><td>1</td><td>2</td><td>3</td></tr><tr><td>$f(x)$</td><td>0</td><td>3</td><td>6</td><td>9</td></tr></table>	x	0	1	2	3	$f(x)$	0	3	6	9
x	0	1	2	3								
$f(x)$	0	3	6	9								
Graphical representation of a function	Graph of ordered pairs (x, y) that satisfy $y = f(x)$	Each point on the graph satisfies $y = 2x$. 										

1.3 Exercises

Evaluating and Representing Functions

- If $f(-2) = 3$, identify a point on the graph of f .
- If $f(3) = -9.7$, identify a point on the graph of f .
- If $(7, 8)$ lies on the graph of f , then $f(\underline{\quad}) = \underline{\quad}$.
- If $(-3, 2)$ lies on the graph of f , then $f(\underline{\quad}) = \underline{\quad}$.

Exercises 5–20: Graph $y = f(x)$ by hand by first plotting points to determine the shape of the graph.

- $f(x) = 3$
- $f(x) = -2$
- $f(x) = 2x$
- $f(x) = x + 1$
- $f(x) = 4 - x$
- $f(x) = 3 + 2x$
- $f(x) = \frac{1}{2}x - 2$
- $f(x) = 2 - 2x$

13. $f(x) = |x - 1|$ 14. $f(x) = |0.5x|$
 15. $f(x) = |3x|$ 16. $f(x) = |2x - 1|$
 17. $f(x) = \frac{1}{2}x^2$ 18. $f(x) = 2x^2$
 19. $f(x) = x^2 - 2$ 20. $f(x) = x^2 + 1$

Exercises 21–34: Complete the following.

- (a) Find $f(x)$ for the indicated values of x , if possible.
 (b) Find the domain of f .

21. $f(x) = x^3$ for $x = -2, 5$
 22. $f(x) = 2x - 1$ for $x = 8, -1$
 23. $f(x) = \sqrt{x}$ for $x = -1, a + 1$
 24. $f(x) = \sqrt{1 - x}$ for $x = -2, a + 2$
 25. $f(x) = 6 - 3x$ for $x = -1, a + 1$
 26. $f(x) = \frac{3x - 5}{x + 5}$ for $x = -1, a$
 27. $f(x) = -7$ for $x = 6, a - 1$
 28. $f(x) = x^2 - x + 1$ for $x = 1, -2$
 29. $f(x) = \frac{1}{x^2}$ for $x = 4, -7$
 30. $f(x) = \sqrt{x - 3}$ for $x = 4, a + 4$
 31. $f(x) = \frac{1}{x^2 - 9}$ for $x = 4, a - 5$
 32. $f(x) = \frac{1}{x^2 + 4}$ for $x = -2, a + 4$
 33. $f(x) = \frac{1}{\sqrt{2 - x}}$ for $x = 1, a + 2$
 34. $f(x) = \frac{1}{\sqrt{x - 1}}$ for $x = 0, a^2 - a + 1$

Exercises 41–46: Use the graph of the function f to estimate its domain and range. Evaluate $f(0)$.

Exercises 35–40: (Refer to Example 4.) Use the graph to complete the following.

- (a) Find the domain of g .
 (b) Use the formula to evaluate $g(-1)$ and $g(2)$.
 (c) Use the graph of g to evaluate $g(-1)$ and $g(2)$.

Exercises 47 and 48: **Diagrams** Complete the following.

- Evaluate $f(2)$.
- Write f as a set of ordered pairs.
- Find the domain and range of f .

Exercises 49–52: Graph $y = f(x)$ in the viewing rectangle $[-4.7, 4.7, 1]$ by $[-3.1, 3.1, 1]$.

- Use the graph to evaluate $f(2)$.
- Evaluate $f(2)$ symbolically.
- Let $x = -3, -2, -1, 0, 1, 2, 3$ and make a table of values for $f(x)$.

49. $f(x) = 0.25x^2$ 50. $f(x) = 3 - 1.5x^2$

51. $f(x) = \sqrt{x + 2}$ 52. $f(x) = |1.6x - 2|$

Exercises 53–60: Use $f(x)$ to determine verbal, graphical, and numerical representations. For the numerical representation use a table with $x = -2, -1, 0, 1, 2$. Evaluate $f(2)$.

53. $f(x) = x^2$ 54. $f(x) = 2x - 5$

55. $f(x) = |2x + 1|$ 56. $f(x) = 8$

57. $f(x) = 5 - x$ 58. $f(x) = |x|$
 59. $f(x) = \sqrt{x + 1}$ 60. $f(x) = x^2 - 1$

Exercises 61 and 62: A function g is defined.

- Write g as a set of ordered pairs.
- Give the domain and range of g .

61. $g(-1) = 2, g(0) = 4, g(1) = -3, g(2) = 2$

62. $g(-4) = 5, g(0) = -5, g(4) = 5, g(8) = 0$

Exercises 63 and 64: Express a function f with the specified representation.

63. **Cost of Driving** In 2008 the average cost of driving a new car was about 50 cents per mile. Give symbolic, graphical, and numerical representations of the cost in dollars of driving x miles. For the numerical representation use a table with $x = 1, 2, 3, 4, 5, 6$. (Source: Associated Press.)

64. **Counterfeit Money** It is estimated that nine out of every one million bills are counterfeit. Give a numerical representation (table) of the predicted number of counterfeit bills in a sample of x million bills where $x = 0, 1, 2, \dots, 6$. (Source: Department of the Treasury.)

Identifying Functions

Exercises 65–70: Does the graph represent a function? If so, determine the function's domain and range.

Exercises 71–74: Determine if the following operation describes a function. Explain your answer.

71. Calculating the cube root of a number
72. Calculating your age
73. Listing the students who passed a given English exam
74. Finding the x -values in the domain of a relation
75. **Identification Numbers** A relation takes a student's identification number at your college as input and outputs the student's name. Does this relation compute a function? Explain.
76. **Heights** A relation takes a student's height rounded to the nearest inch as input and outputs the student's name with that height. Does this relation typically compute a function? Explain.

Exercises 77–82: Determine if S is a function.

77. $S = \{(1, 2), (2, 3), (4, 5), (1, 3)\}$
78. $S = \{(-3, 7), (-1, 7), (3, 9), (6, 7), (10, 0)\}$
79. $S = \{(a, 2), (b, 3), (c, 3), (d, 3), (e, 2)\}$
80. $S = \{(a, 2), (a, 3), (b, 5), (-b, 7)\}$
81. S is given by the table.

x	1	3	1
y	10.5	2	-0.5

82. S is given by the table.

x	1	2	3
y	1	1	1

Exercises 83–90: Determine if y is a function of x .

83. $x = y^4$
84. $y^2 = x + 1$
85. $\sqrt{x+1} = y$
86. $x^2 = y - 7$

87. $x^2 + y^2 = 70$

88. $(x - 1)^2 + y^2 = 1$

89. $x + y = 2$

90. $y = |x|$

Exercises 91–96: Formulas Write a symbolic representation (formula) for a function g that calculates the given quantity. Then evaluate $g(10)$ and interpret the result.

91. The number of inches in x feet
92. The number of quarts in x gallons
93. The number of dollars in x quarters
94. The number of quarters in x dollars
95. The number of seconds in x days
96. The number of feet in x miles

Applications

97. **Income and Education** (Refer to Example 2.) The function I computes median 2004 individual annual earnings for females (in dollars) by educational attainment. This function is defined by $I(N) = 19,162$, $I(H) = 26,029$, $I(B) = 41,681$, and $I(M) = 51,316$. (Source: *Digest of Education Statistics, 2005*.)
 - (a) Write I as a set of ordered pairs.
 - (b) Give the domain and range of I .
98. **Music and Digital Downloads** Function P computes the percentage of total music sales that were digital downloads during a selected year. This function is defined by $P(2002) = 0.5\%$, $P(2003) = 1.3\%$, $P(2004) = 2.9\%$, $P(2005) = 5.7\%$, and $P(2006) = 9.4\%$. (Source: Recording Industry Association of America.)
 - (a) Write P as a set of ordered pairs.
 - (b) Give the domain and range of P .
99. **Going Green** The average person uses 2200 paper napkins in one year. Write the formula for a function N that calculates the number of paper napkins that the average person uses in x years. Evaluate $N(3)$ and interpret your result.
100. **Going Green** The average top-loading washing machine uses about 40 gallons of water per load of clothes. Write the formula for a function W that calculates the number of gallons of water used while washing x loads of clothes. Evaluate $W(30)$ and interpret your result.

101. **Air Temperature** (Refer to Example 6.) When the relative humidity is 100%, air cools 5.8°F for every 1-mile increase in altitude. Give verbal, symbolic, graphical, and numerical representations of a function f that computes this change in temperature for an increase in altitude of x miles for $0 \leq x \leq 3$. (Source: L. Battan.)
102. **Crutch Length** (Refer to Example 7.) Determine the crutch length for someone 6 feet 3 inches tall. For each 1-inch increase in a person's height, by how much does the recommended crutch length increase?
103. **Distance to Lightning** Find a formula for a function f that computes the distance between an observer and a lightning bolt when the speed of sound is 1150 feet per second. Evaluate $f(15)$ and interpret the result.
104. **Distance to Lightning** Give a reasonable domain for the function f that you found in Exercise 103. Graph f over the domain that you selected. What is the range of your function? (Note that answers may vary.)

Writing about Mathematics

105. Explain how you could use a complete numerical representation (table) for a function to determine its domain and range.
106. Explain in your own words what a function is. How is a function different from a relation?

1.4 Types of Functions

- Identify and use constant and linear functions
- Interpret slope as a rate of change
- Identify and use nonlinear functions
- Recognize linear and nonlinear data

Figure 1.64 A Discrete Constant Model

Introduction

Functions are used to describe, or *model*, everything from weather to new product “specs,” global warming, and U.S. population. New functions are created each day in the dynamic field of mathematics. Finding new functions—whether to describe the wind speed in Hawaii or to calculate the memory requirements of an iPod—requires creativity. This section discusses three common types of functions: *constant*, *linear*, and *nonlinear*.

Constant Functions

The monthly average wind speeds in miles per hour at Hilo, Hawaii, from May through December are listed in Table 1.11.

Table 1.11

Month	May	June	July	Aug	Sept	Oct	Nov	Dec
Wind speed (mph)	7	7	7	7	7	7	7	7

Source: J. Williams, *The Weather Almanac*.

A Discrete Function It is apparent that the monthly average wind speed is constant between May and December. These data can be described by a set f of ordered pairs (x, y) , where x is the month and y is the wind speed. The months have been assigned the standard numbers.

$$f = \{(5, 7), (6, 7), (7, 7), (8, 7), (9, 7), (10, 7), (11, 7), (12, 7)\}$$

The function f is given by $f(x) = 7$, where $x = 5, 6, 7, \dots, 12$. The output of f never changes. We say that f is a *constant function* and *models* the data in Table 1.11. The range of f is $R = \{7\}$, and the domain of f is $D = \{5, 6, 7, 8, 9, 10, 11, 12\}$. Since f is defined only at individual or discrete values of x , f is called a **discrete function**. The graph of a discrete function suggests a scatterplot, as shown in Figure 1.64.

A Continuous Function Sometimes it is more convenient to describe discrete data with a continuous graph. If the domain of $f(x) = 7$ is changed to $D = \{x \mid 5 \leq x \leq 12\}$, its graph becomes a continuous horizontal line (segment) without breaks. See Figure 1.65. The graph of a **continuous function** can be sketched without picking up the pencil. There are no breaks in the graph of a continuous function. The graph of a continuous constant function is a horizontal line (or in this case, a horizontal line segment).

Figure 1.65 A Continuous Constant Model

If the domain includes $x = 6.5$, what does $f(6.5) = 7$ represent? The expression $f(6)$ computes the average wind speed in **June**, and $f(7)$ gives the average wind speed in **July**. We might interpret $f(6.5)$ to represent the average wind speed from **June 15 to July 15**. Other interpretations are possible.

A formal definition of a constant function is now given.

Constant Function

A function f represented by $f(x) = b$, where b is a constant (fixed number), is a **constant function**.

NOTE As simple as constant functions might appear, they occur frequently in applications. The following are examples of computations that can be described by constant functions. In both cases the independent variable (input) is time.

- A thermostat computes a constant function regardless of the weather outside by maintaining a set temperature. If the thermostat is set at 72°F , then $f(x) = 72$.
- A cruise control in a car computes a constant function by maintaining a fixed speed regardless of the type of road or terrain. If the cruise control is set at 55 miles per hour, then $f(x) = 55$.

Linear Functions

A car is initially located 30 miles north of the Texas border and is traveling north on Interstate 35 at 60 miles per hour. The distances between the automobile and the border are listed in Table 1.12 for various times.

Table 1.12

Elapsed time (hours)	0	1	2	3	4	5
Distance (miles)	30	90	150	210	270	330

Figure 1.66 A Discrete Linear Model

Figure 1.67 A Continuous Linear Model

The table shows that the distance increases by 60 miles every hour. These data can be given by a set f of ordered pairs (x, y) , where x is the elapsed time and y is the distance.

$$f = \{(0, 30), (1, 90), (2, 150), (3, 210), (4, 270), (5, 330)\}$$

The set f is a function, but not a constant function. A scatterplot of f , shown in Figure 1.66, suggests a line that rises from left to right.

If the car travels for x hours, the distance traveled can be found by multiplying 60 times x and adding the initial distance of 30 miles. This computation can be expressed as $f(x) = 60x + 30$. For example, $f(1.5) = 60(1.5) + 30 = 120$ means that the car is 120 miles from the border after 1.5 hours. The formula is valid for nonnegative x . The graph of $f(x) = 60x + 30$ is a line (ray), shown in Figure 1.67. We call f a *linear function*.

Linear Function

A function f represented by $f(x) = ax + b$, where a and b are constants, is a **linear function**.

NOTE If $a = 0$, then $f(x) = b$, which defines a constant function. Thus every constant function is also a linear function.

Recognizing Linear Functions In the example of the moving car, $f(x) = 60x + 30$, so $a = 60$ and $b = 30$. The value of a represents the speed of the car, and b is the initial distance of the car from the border. Other examples of linear functions include the following.

$f(x) = 1.5x - 6$	$a = 1.5,$	$b = -6$
$g(t) = 8t$	$a = 8,$	$b = 0$
$h(x) = 72$	$a = 0,$	$b = 72$
$k(t) = 1.9 - 3t$	$a = -3,$	$b = 1.9$

A distinguishing feature of a linear function f is that each time x increases by one unit, the value of $f(x)$ always changes by an amount equal to a . That is, a linear function has a **constant rate of change**. (The constant rate of change a is equal to the slope of the graph of f .) The following applications are modeled by linear functions. Try to determine the value of the constant a in each case.

- The wages earned by an individual working x hours at \$6.25 per hour
- The amount of tuition and fees due when registering for x credits if each credit costs \$75 and the fees are fixed at \$56

Slope as a Rate of Change

The graph of a (continuous) linear function is a line. Slope is a real number that measures the “tilt” of a line in the xy -plane. If the input x to a linear function increases by 1 unit, then the output y changes by a constant amount that is equal to the slope of its graph. In Figure 1.68 a line passes through the points (x_1, y_1) and (x_2, y_2) . The *change in y* is $y_2 - y_1$, and the *change in x* is $x_2 - x_1$. The ratio of the change in y to the change in x is called the *slope*. We sometimes denote the change in y by Δy (delta y) and the change in x by Δx (delta x). That is, $\Delta y = y_2 - y_1$ and $\Delta x = x_2 - x_1$.

Figure 1.68

Slope

The **slope** m of the line passing through the points (x_1, y_1) and (x_2, y_2) is

$$m = \frac{\Delta y}{\Delta x} = \frac{y_2 - y_1}{x_2 - x_1}, \quad \text{where } x_1 \neq x_2.$$

If the slope of a line is positive, the line *rises* from left to right. If the slope is negative, the line *falls* from left to right. Slope 2 indicates that the line rises 2 units for every unit increase in x , and slope $-\frac{1}{2}$ indicates that the line *falls* $\frac{1}{2}$ unit for every unit increase in x . Slope 0 indicates that the line is horizontal. When $x_1 = x_2$, the line is vertical and the slope is undefined. Figures 1.69–1.72 illustrate these situations.

Figure 1.69

Figure 1.70

Figure 1.71

Figure 1.72

EXAMPLE 1 Calculating the slope of a line

Find the slope of the line passing through the points $(-2, 3)$ and $(1, -2)$. Plot these points together with the line. Interpret the slope.

SOLUTION The slope is

$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{-2 - 3}{1 - (-2)} = -\frac{5}{3}.$$

A graph of the line passing through these two points is shown in Figure 1.73. The change in y is $\Delta y = -5$ and the change in x is $\Delta x = 3$, so $m = \frac{\Delta y}{\Delta x} = -\frac{5}{3}$ indicates that the line falls $\frac{5}{3}$ units for each unit increase in x , or equivalently, the line falls 5 units for each 3-unit increase in x .

Now Try Exercise 7

Figure 1.73

Slope and the Value of a The graph of $f(x) = ax + b$ is a line. Since $f(0) = b$ and $f(1) = a + b$, the graph of f passes through the points $(0, b)$ and $(1, a + b)$. The slope of this line is

$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{a + b - b}{1 - 0} = \frac{a}{1} = a.$$

Interpreting Slope In applications involving linear functions, slope sometimes is interpreted as a (constant) rate of change. In Example 7 of Section 1.3, the recommended crutch length for a person x inches tall was given by $f(x) = 0.72x + 2$. The slope of this graph is 0.72. One interpretation of this slope is that for each 1-inch increase in the height of a person, the crutch length should be increased by 0.72 inch.

Figure 1.74

EXAMPLE 2 Interpreting slope and iPod memory

Figure 1.74 shows the (approximate) number of songs that can be stored on x gigabytes of Classic iPod memory. (Source: Apple Corporation.)

- Why is it reasonable for the graph to pass through the origin?
- Find the slope of the line segment.
- Interpret the slope as a rate of change.

SOLUTION

- Because 0 songs require no memory, the graph passes through the point $(0, 0)$.
- The graph passes through the points $(0, 0)$ and $(80, 20000)$. The slope of the line is

$$m = \frac{20,000 - 0}{80 - 0} = 250.$$

- An iPod holds 250 songs per gigabyte.

Now Try Exercise 31

MAKING CONNECTIONS

Units for Rates of Change The units for a rate of change can be found from a graph by placing the units from the vertical axis over the units from the horizontal axis. For example, in Figure 1.74 the units on the y -axis are *songs* and the units on the x -axis are *gigabytes*. Thus the units for the slope, or rate of change, are *songs per gigabyte*.

Nonlinear Functions

Table 1.13

Year	Population (millions)
1800	5
1820	10
1840	17
1860	31
1880	50
1900	76
1920	106
1940	132
1960	179
1980	226
2000	281
2020	336*

Source: Bureau of the Census.

*Projected

Table 1.13 shows the population of the United States at 20-year intervals from 1800 to 2020. Between 1800 and 1820 the population increased by 5 million, between 1820 and 1840 it increased by 7 million, and between 1840 and 1860 the increase was 14 million. Because the increases in population for the 20-year periods are not equal or nearly equal, we cannot describe (model) these data with a linear function. We need a *nonlinear function* instead.

The population data from Table 1.13 are shown in Figure 1.75. In Figure 1.76 the data together with a nonlinear function f have been plotted. The graph of f is curved rather than straight.

Figure 1.75 A Discrete Nonlinear Model

Figure 1.76 A Continuous Nonlinear Model

CLASS DISCUSSION

The time required to drive 100 miles depends on the average speed. Let $f(x)$ compute this time, given the average speed x as input. For example, $f(50) = 2$, because it would take 2 hours to travel 100 miles at an average speed of 50 miles per hour. Make a table of values for f . Is f linear or nonlinear?

Recognizing Nonlinear Functions If a function is not linear, then it is called a **nonlinear function**. *The graph of a nonlinear function is not a (straight) line.* With a nonlinear function, it is possible for the input x to increase by 1 unit and the output y to change by different amounts. Nonlinear functions *cannot* be written in the form $f(x) = ax + b$.

Real-world phenomena often are modeled by using nonlinear functions. The following are two examples of quantities that can be described by nonlinear functions.

- The monthly average temperature in Chicago (Monthly average temperatures increase and decrease throughout the year.)
- The height of a child between the ages of 2 and 18 (A child grows faster at certain ages.)

EXAMPLE 3 Recognizing linear and nonlinear data

For each table decide whether the data are linear or nonlinear. If the data are linear, state the slope of the line that passes through the data points.

(a)	x	0	5	10	15	20
	y	-4	-2	0	2	4

(b)	x	-3	0	3	6	9
	y	5	7	10	14	19

(c)	x	0	1	2	3	4
	y	11	11	11	11	11

(d)	x	0	1	3	6	10
	y	3	6	9	12	15

SOLUTION

- (a) The y -values increase 2 units for each 5-unit increase in x . Therefore the data are linear, but not constant. The slope of the line passing through the points is $m = \frac{2}{5}$.
- (b) The y -values do not increase by a constant amount for each 3-unit increase in x . The data are nonlinear.
- (c) These data are linear and constant. The slope of the line passing through these data points is 0.
- (d) Although the y -values increase by 3 units between consecutive data points, the data are nonlinear because the corresponding increases in the x -values are not constant. For example, the slope of the line passing through $(0, 3)$ and $(1, 6)$ is 3, whereas the slope of the line passing through $(1, 6)$ and $(3, 9)$ is 1.5. **Now Try Exercises 49 and 51** ◀

Graphs of Nonlinear Functions There are many nonlinear functions. In Figures 1.77–1.80 graphs and formulas are given for four common nonlinear functions. Note that each graph is not a line. See Appendix B for more examples of functions.

Figure 1.77
Square Function

Figure 1.78
Square Root Function

Figure 1.79
Cube Function

Figure 1.80
Absolute Value Function

The next example illustrates how to graph a nonlinear function by hand.

EXAMPLE 4 Graphing a nonlinear function

Graph $f(x) = \sqrt[3]{x}$.

SOLUTION

Getting Started Function f is the cube root function. For example, $\sqrt[3]{-8} = -2$, because $(-2)(-2)(-2) = (-2)^3 = -8$. Start by making a table of convenient values. See Table 1.14. Plot the points and then connect them with a smooth curve.

Table 1.14 Cube Root Function

x	-8	-1	0	1	8
$\sqrt[3]{x}$	-2	-1	0	1	2

The points $(-8, -2)$, $(-1, -1)$, $(0, 0)$, $(1, 1)$, and $(8, 2)$ and a smooth curve connecting them are shown in Figure 1.81. Notice that f is a nonlinear function because its graph is *not* a line.

Figure 1.81 Cube Root Function

Now Try Exercise 45

Sketching a Nonlinear Model The next example demonstrates how to model a physical situation with a graph of a nonlinear function.

EXAMPLE 5 Sketching a model

A hole is drilled in the bottom of a plastic tank that contains 100 gallons of water. Water begins to leak out, and after 10 minutes the tank is empty. Sketch a graph that shows the amount of water W in the tank after t minutes.

Figure 1.82

SOLUTION

Getting Started When the tank is full, water will rush out at a faster rate, and then the rate will be slower after a while. Because the rate at which water leaks out of the tank is not constant, a nonlinear graph is needed to show this situation. ▶

Let W be the number of gallons of water in the tank after t minutes. First plot the points $(0, 100)$ and $(10, 0)$, because 100 gallons of water are in the tank initially and the tank is empty after 10 minutes. Because the water level goes down faster at first, sketch a curve that “slopes” downward more at first and then starts to level off. See Figure 1.82.

Now Try Exercise 61 ◀

1.4 Putting It All Together

The following table summarizes important concepts from this section.

Concept	Formula	Examples
Slope of a line passing through (x_1, y_1) and (x_2, y_2)	$m = \frac{\Delta y}{\Delta x} = \frac{y_2 - y_1}{x_2 - x_1}$ $\Delta y = y_2 - y_1$ denotes the change in y . $\Delta x = x_2 - x_1$ denotes the change in x .	A line passing through $(-1, 3)$ and $(1, 7)$ has slope $m = \frac{7-3}{1-(-1)} = \frac{4}{2} = 2$. This slope indicates that the line rises 2 units for each unit increase in x .
Constant function	$f(x) = b$, where b is a fixed number, or constant.	$f(x) = 12$, $g(x) = -2.5$, and $h(x) = 0$. Every constant function is also linear.
Linear function	$f(x) = ax + b$, where a and b are constants. The graph of f has slope a .	$f(x) = 3x - 1$, $g(x) = -5$, and $h(x) = \frac{1}{2} - \frac{3}{4}x$. Their graphs have slopes 3, 0, and $-\frac{3}{4}$.
Nonlinear function	A nonlinear function cannot be expressed in the form $f(x) = ax + b$.	$f(x) = \sqrt{x+1}$, $g(x) = 4x^3$, and $h(x) = x^{1.01} + 2$

The following table summarizes important concepts related to constant, linear, and nonlinear functions.

Concept	Constant Function	Linear Function	Nonlinear Function
Slope of graph	Always zero	Always constant	No notion of one slope
Graph	Horizontal line	Nonvertical line	Not a line
Examples			

1.4 Exercises

Formulas for Linear Functions

Exercises 1–6: A linear function f can be written in the form $f(x) = ax + b$. Identify a and b for the given $f(x)$.

1. $f(x) = 5 - 2x$ 2. $f(x) = 3 - 4x$

3. $f(x) = -8x$ 4. $f(x) = 10x$

5. $f(x) = 7$ 6. $f(x) = -6$

Slope

Exercises 7–22: If possible, find the slope of the line passing through each pair of points.

7. $(4, 6), (2, 5)$ 8. $(-8, 5), (-3, -7)$

9. $(-1, 4), (5, -2)$ 10. $(10, -4), (-15, 7)$

11. $(12, -8), (7, -8)$ 12. $(8, -5), (8, 2)$

13. $(0.2, -0.1), (-0.3, 0.4)$ 14. $(-0.3, 0.6), (-0.2, 1.1)$

15. $(-0.5, 9.2), (-0.3, 7.6)$ 16. $(1.6, 12), (1.6, 5)$

17. $(1997, 5.6), (1994, 7.9)$ 18. $(1824, 108), (1900, 380)$

19. $(-5, 6), (-5, 8)$ 20. $(17, 7), (19, 7)$

21. $(\frac{1}{3}, -\frac{3}{5}), (-\frac{5}{6}, \frac{7}{10})$ 22. $(-\frac{13}{15}, -\frac{7}{8}), (\frac{1}{10}, \frac{3}{16})$

Exercises 23–30: State the slope of the graph of f . Interpret this slope.

23. $f(x) = 2x + 7$ 24. $f(x) = 6 - x$

25. $f(x) = -\frac{3}{4}x$ 26. $f(x) = \frac{2}{3}x$

27. $f(x) = -5$ 28. $f(x) = x + 5$

29. $f(x) = 9 - x$ 30. $f(x) = 23$

Slope as a Rate of Change

31. **Price of Carpet** The graph at the top of the next column shows the price of x square yards of carpeting.

(a) Why is it reasonable for the graph to pass through the origin?

(b) Find the slope of the graph.

(c) Interpret the slope as a rate of change.

32. **Landscape Rock** The figure shows the price of x tons of landscape rock.

(a) Why is it reasonable for the graph to pass through the origin?

(b) Find the slope of the graph.

(c) Interpret the slope as a rate of change.

33. **Going Green** The function given by $P(x) = 19.4x$ calculates the pounds of CO_2 (carbon dioxide) released into the atmosphere by a car burning x gallons of gasoline.

(a) Calculate $P(20)$ and interpret the result.

(b) Find the slope of the graph of P . Interpret this slope as a rate of change.

34. **Velocity of a Train** The distance D in miles that a train is from a station after x hours is given by the formula $D(x) = 150 - 20x$.

- (a) Calculate $D(5)$ and interpret the result.
(b) Find the slope of the graph of D . Interpret this slope as a rate of change.

35. **Velocity of a Car** A driver's distance D in miles from a rest stop after x hours is given by $D(x) = 75x$.

- (a) How far is the driver from the rest stop after 2 hours?
(b) Find the slope of the graph of D . Interpret this slope as a rate of change.

36. **Age in the United States** The median age of the U.S. population for each year t between 1970 and 2010 can be approximated by the formula $A(t) = 0.243t - 450.8$. (Source: Bureau of the Census.)

- (a) Compute the median ages in 1980 and 2000.
(b) What is the slope of the graph of A ? Interpret the slope.

37. **Velocity** A car's distance from a service center along a straight highway can be described by a constant function of time. What can be said about the car's velocity?

38. **Velocity** A car's distance in miles from a rest stop along a straight stretch of an interstate highway after x hours can be modeled by $f(x) = ax$. Discuss what can be said about the car's velocity.

Linear and Nonlinear Functions

Exercises 39–48: Determine if f is a linear or nonlinear function. If f is a linear function, determine if f is a constant function. Support your answer by graphing f .

39. $f(x) = -2x + 5$ 40. $f(x) = 3x - 2$

41. $f(x) = 1$ 42. $f(x) = -2$

43. $f(x) = |x + 1|$ 44. $f(x) = |2x - 1|$

45. $f(x) = x^2 - 1$ 46. $f(x) = x^3$

47. $f(x) = 2\sqrt{x}$ 48. $f(x) = \sqrt{x - 1}$

Linear and Nonlinear Data

Exercises 49–54: (Refer to Example 3.) Decide whether the data are linear or nonlinear. If the data are linear, state the slope m of the line passing through the data points.

49.

x	0	1	2	3	4
y	-1	3	7	11	15

50.

x	-4	-2	0	2	4
y	1	$-\frac{1}{2}$	-2	$-\frac{7}{2}$	-5

51.

x	-5	-3	1	3	5
y	-5	-2	1	4	7

52.

x	-4	-2	0	2	4
y	-1	-1	-1	-1	-1

53.

x	-4	0	1	2	5
y	5	3	$\frac{5}{2}$	2	$\frac{1}{2}$

54.

x	10	20	25	35	40
y	40	190	300	600	790

Exercises 55–58: Analyzing Real Data For the given data set complete the following.

- (a) Make a line graph of the data. Let this graph represent a function f .
(b) Decide whether f is linear or nonlinear.

55. Toyota vehicles sold in the United States (millions)

Year	1998	2000	2002	2004

Curve Sketching

Exercises 61–64: Sketch a graph that illustrates the motion of the person described. Let the x -axis represent time and the y -axis represent distance from home. Be sure to label each axis.

61. A person drives a car away from home for 2 hours at 50 miles per hour and then stops for 1 hour.
62. A person drives to a nearby park at 25 miles per hour for 1 hour, rests at the park for 2 hours, and then drives home at 50 miles per hour.
63. A person walks away from home at 4 miles per hour for 1 hour and then turns around and walks home at the same speed.
64. A person arrives at home after running at 8 miles per hour for 2 hours.

Writing about Mathematics

65. Describe two methods of determining if a data set can be modeled by a linear function. Create or find a data set that consists of four or more ordered pairs. Can your data set be modeled by a linear function?
66. Suppose you are given a graphical representation of a function f . Explain how you would determine whether f is constant, linear, or nonlinear. How would you determine the type if you were given a numerical or symbolic representation? Give examples.

EXTENDED AND DISCOVERY EXERCISE

1. **Geometry** Suppose that the radius of a circle on a computer monitor is increasing at a constant rate of 1 inch per second.
- (a) Does the circumference of the circle increase at a constant rate? If it does, find this rate.
- (b) Does the area of the circle increase at a constant rate? Explain.

CHECKING BASIC CONCEPTS FOR SECTIONS 1.3 AND 1.4

- Create symbolic, numerical, and graphical representations of a function f that computes the number of feet in x miles. For the numerical representation use a table and let $x = 1, 2, 3, 4, 5$.
- Let $f(x) = \frac{2x}{x-4}$.
 - Find $f(2)$ and $f(a+4)$.
 - Find the domain of f .
- Graph $f(x) = x^2 - 2$. Identify the domain and range.
- Find the slope of the line passing through the points $(-2, 4)$ and $(4, -5)$. If the graph of $f(x) = ax + b$ passes through these two points, what is the value of a ?
- Identify each function f as constant, linear, or nonlinear. Support your answer graphically.
 - $f(x) = -1.4x + 5.1$
 - $f(x) = 25$
 - $f(x) = 2x^2 - 5$

1.5 Functions and Their Rates of Change

- Identify where a function is increasing or decreasing
- Use interval notation
- Use and interpret average rate of change
- Calculate the difference quotient

Introduction

Sales of rock music have not remained constant during the past two decades. In 1990, rock music accounted for 36% of all U.S. music sales. This percentage decreased to a low of 24% in 2001 and then increased to 34% in 2006. (Source: Recording Industry Association of America.)

A linear function cannot be used to describe these data because the graph of a (non-constant) linear function either always rises or always falls. The concepts of increasing and decreasing are important to functions and their rates of change.

Increasing and Decreasing Functions

Figure 1.83 shows sales of rock music modeled by a continuous nonlinear function f . For example, $f(1990) = 36$ indicates that rock music accounted for 36% of all music sales in 1990. Rock music sales decreased from 1990 to 2001 and then increased from 2001 to 2006. Mathematically, we say that function f decreases for $1990 \leq x \leq 2001$ and increases for $2001 \leq x \leq 2006$.

Figure 1.83 U.S. Rock Music Sales

DEFINITION The inequality $a \leq x \leq b$ means that $x \geq a$ and $x \leq b$.

The concepts of increasing and decreasing are defined as follows.

Increasing and Decreasing Functions

Suppose that a function f is defined over an interval I on the number line. If x_1 and x_2 are in I ,

- f **increases** on I if, whenever $x_1 < x_2$, $f(x_1) < f(x_2)$;
- f **decreases** on I if, whenever $x_1 < x_2$, $f(x_1) > f(x_2)$.

Figures 1.84 and 1.85 illustrate these concepts at the top of the next page.

The concepts of increasing and decreasing relate to whether the graph of a function rises or falls. If we could walk *from left to right* along the graph of an increasing function, it would be uphill. For a decreasing function, we would walk downhill. We speak of a function f increasing or decreasing *over an interval of its domain*. For example, in Figure 1.86 the function is decreasing (the graph falls) when $-2 \leq x \leq 0$ and increasing (the graph rises) when $0 \leq x \leq 2$.

When $x_1 < x_2$, $f(x_1) < f(x_2)$,
 f is increasing.

Figure 1.84

When $x_1 < x_2$, $f(x_1) > f(x_2)$,
 f is decreasing.

Figure 1.85

Figure 1.86

EXAMPLE 1 Recognizing increasing and decreasing graphs

The graphs of three functions are shown in Figure 1.87. Determine intervals where each function is increasing or decreasing.

(a)

(b)

(c)

Figure 1.87

SOLUTION

- (a) Moving from *left to right*, the graph of $f(x) = |x|$ is decreasing for $x \leq 0$ and increasing for $x \geq 0$.
- (b) Moving from *left to right*, the graph of $f(x) = x^3$ is increasing for all real numbers x . Note that the y -values always increase as the x -values increase.
- (c) The graph of $f(x) = \sqrt{x}$ is increasing for $x \geq 0$. **Now Try Exercises 17, 18, and 19** ◀

NOTE When stating where a function is increasing and where it is decreasing, it is important to give x -intervals and not y -intervals.

Interval Notation

To describe intervals where functions are increasing or decreasing, a number line graph is sometimes used. The set $\{x | x > 2\}$, which includes all real numbers greater than 2, is graphed in Figure 1.88. Note that a parenthesis at $x = 2$ indicates that the endpoint is *not included*. The set $\{x | -1 \leq x \leq 4\}$ is shown in Figure 1.89 on the next page, and the set $\{x | -\frac{7}{2} < x < -\frac{1}{2}\}$ is shown in Figure 1.90 on the next page. Note that brackets, either $[$ or $]$, are used when endpoints *are included*.

Figure 1.88 $x > 2$

Figure 1.89 $-1 \leq x \leq 4$ Figure 1.90 $-\frac{7}{2} < x < -\frac{1}{2}$

A convenient notation for number line graphs is called **interval notation**. Instead of drawing the entire number line, as in Figure 1.89, we can express the set as $[-1, 4]$. Because the set includes the endpoints -1 and 4 , the interval is a **closed interval** and brackets are used. A set that included all real numbers satisfying $-\frac{7}{2} < x < -\frac{1}{2}$ would be expressed as the **open interval** $(-\frac{7}{2}, -\frac{1}{2})$. Parentheses indicate that the endpoints are not included in the set. An example of a **half-open interval** is $[0, 4)$, which represents the interval $0 \leq x < 4$.

Table 1.15 provides some examples of interval notation. The symbol ∞ refers to **infinity**; it does not represent a real number. The notation $(1, \infty)$ means $\{x | x > 1\}$, or simply $x > 1$. Since this interval has no maximum x -value, ∞ is used in the position of the right endpoint. A similar interpretation holds for the symbol $-\infty$, which represents **negative infinity**.

Now An inequality in the form $x < 1$ or $x > 3$ indicates the set of real numbers that are either less than 1 or greater than 3. The **union symbol** \cup can be used to write this inequality in interval notation as $(-\infty, 1) \cup (3, \infty)$.

Table 1.15 Interval Notation

Inequality	Interval Notation	Graph
$-2 < x < 2$	$(-2, 2)$ open interval	
$-1 < x \leq 3$	$(-1, 3]$ half-open interval	
$-3 \leq x \leq 2$	$[-3, 2]$ closed interval	
$x > -3$	$(-3, \infty)$ infinite interval	
$x \leq 1$	$(-\infty, 1]$ infinite interval	
$x \leq -2$ or $x > 1$	$(-\infty, -2] \cup (1, \infty)$ infinite intervals	
$-\infty < x < \infty$ (entire number line)	$(-\infty, \infty)$ infinite interval	

MAKING CONNECTIONS

Points and Intervals The expression $(2, 5)$ has two possible meanings. It may represent the ordered pair $(2, 5)$, which can be plotted as a point on the xy -plane, or it may represent the open interval $2 < x < 5$. To alleviate confusion, phrases like “the point $(2, 5)$ ” or “the interval $(2, 5)$ ” may be used.

Increasing, Decreasing, and Endpoints There can be confusion as to whether to include the endpoints of an interval when stating where a function is increasing or decreasing. For example, is the graph of $f(x) = x^2$, shown in Figure 1.91, increasing on $[0, \infty)$ or just on $(0, \infty)$? The definition of increasing and decreasing allows us to include 0 as part of the interval I where f is increasing, because if we let $x_1 = 0$, then $f(0) < f(x_2)$ whenever $0 < x_2$. Thus $f(x) = x^2$ is increasing on $[0, \infty)$. Similarly, we can show that $f(x) = x^2$ is decreasing on $(-\infty, 0]$ by letting $x_2 = 0$. Do *not* confuse these concepts by saying that function f both increases and decreases at the point $(0, 0)$. The concepts of increasing and decreasing apply only to intervals of the real number line and not to individual points.

Figure 1.91

Note that it is *not* incorrect to say that $f(x) = x^2$ is increasing on $(\infty, 0)$ because $f(x) = x^2$ also increases on $[1, \infty)$, $(10, \infty)$, and $[100, 200]$. However, we generally give the largest interval possible, $[0, \infty)$, when stating where a function is increasing or decreasing. (Reference: J. Stewart, *Essential Calculus*, 2007, p. 8.)

NOTE Some definitions of increasing and decreasing functions require that the x -interval be an *open* interval. An open interval does *not* include the endpoints. For example, with these definitions, the graph of $f(x) = x^2$ is decreasing for $(-\infty, 0)$, not $(-\infty, 0]$, and increasing for $(0, \infty)$, not $[0, \infty)$.

EXAMPLE 2 Determining where a function is increasing or decreasing

Use the graph of $f(x) = 4x - \frac{1}{3}x^3$ (shown in Figure 1.92) and interval notation to identify where f is increasing or decreasing.

Figure 1.92

SOLUTION Moving from left to right on the graph of f , the y -values decrease until $x = -2$, increase until $x = 2$, and decrease thereafter. Thus $f(x) = 4x - \frac{1}{3}x^3$ is decreasing on $(-\infty, -2]$, increasing on $[-2, 2]$, and decreasing again on $[2, \infty)$. In interval notation f is decreasing on $(-\infty, -2] \cup [2, \infty)$.

Average Rate of Change

A nonlinear function can increase on one interval of its domain and decrease on another interval of its domain. The graphs of nonlinear functions are not lines, so there is no notion of a single slope. See Example 2. The slope of the graph of a linear function gives its rate of change. With a nonlinear function we speak of an *average* rate of change. Suppose that the points (x_1, y_1) and (x_2, y_2) lie on the graph of a nonlinear function f . See Figure 1.93. The slope of the line L passing through these two points represents the *average rate of change of f from x_1 to x_2* . The line L is referred to as a **secant line**. If different values for x_1 and x_2 are selected, then a different secant line and a different average rate of change usually result.

Figure 1.93

Figure 1.94

In applications the average rate of change measures how fast a quantity is changing over an interval of its domain, *on average*. For example, suppose the graph of the function f in Figure 1.94 represents the distance y in miles that a car has traveled on a straight highway (under construction) after x hours. The points $(0.5, 2)$ and $(1, 21)$ lie on this graph. Thus after 0.5 hour the car has traveled 2 miles and after 1 hour the car has traveled 21 miles. The slope of the line passing through these two points is

$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{21 - 2}{1 - 0.5} = 38.$$

This means that during the half hour from 0.5 to 1 hour the average rate of change, or average velocity, was 38 miles per hour. These ideas lead to the following definition.

Average Rate of Change

Let (x_1, y_1) and (x_2, y_2) be distinct points on the graph of a function f . The **average rate of change of f from x_1 to x_2** is

$$\frac{y_2 - y_1}{x_2 - x_1}.$$

That is, the average rate of change from x_1 to x_2 equals the slope of the line passing through (x_1, y_1) and (x_2, y_2) .

NOTE If $y = f(x)$, then average rate of change equals $\frac{f(x_2) - f(x_1)}{x_2 - x_1}$.

If f is a constant function, its average rate of change is 0. For a linear function defined by $f(x) = ax + b$, the average rate of change is a , the slope of its graph. The average rate of change for a nonlinear function varies.

Table 1.16

Year	Population
1800	5
1840	17
1900	76
1940	132

EXAMPLE 1 Calculating and interpreting average rates of change

Table 1.16 lists the U.S. population in millions for selected years.

- (a) Calculate the average rates of change in the U.S. population from 1800 to 1840 and from 1900 to 1940. Interpret the results.
 (b) Illustrate your results from part (a) graphically.

SOLUTION

- (a) In 1800 the population was 5 million, and in 1840 it was 17 million. Therefore the average rate of change in the population from 1800 to 1840 was

$$\frac{17 - 5}{1840 - 1800} = 0.3.$$

In 1900 the population was 76 million, and in 1940 it was 132 million. Therefore the average rate of change in the population from 1900 to 1940 was

$$\frac{132 - 76}{1940 - 1900} = 1.4.$$

This means that from 1800 to 1840 the U.S. population increased, *on average*, by 0.3 million per year and from 1900 to 1940 the U.S. population increased, *on average*, by 1.4 million per year.

- (b) These average rates of change can be illustrated graphically by sketching a line L_1 through the points (1800, 5) and (1840, 17) and another line L_2 through the points (1900, 76) and (1940, 132), as depicted in Figure 1.95. The slope of L_1 is 0.3 and the slope of L_2 is 1.4.

Now Try Exercises 51 and 59 ◀

Figure 1.95

EXAMPLE 2 Modeling braking distance for a car

Highway engineers sometimes estimate the braking distance in feet for a car traveling at x miles per hour on wet, level pavement by using the formula $f(x) = \frac{1}{9}x^2$. (Source: L. Haefner, *Introduction to Transportation Systems*.)

- (a) Evaluate $f(30)$ and $f(60)$. Interpret these results.
 (b) Calculate the average rate of change of f from 30 to 60. Interpret this result.

SOLUTION

- (a) $f(30) = \frac{1}{9}(30)^2 = 100$ and $f(60) = \frac{1}{9}(60)^2 = 400$. At 30 miles per hour the braking distance is 100 feet, and at 60 miles per hour the braking distance is 400 feet.
 (b) The average rate of change of f from 30 to 60 is

$$\frac{400 - 100}{60 - 30} = 10.$$

Braking distance increases, on average, by 10 feet for each 1-mile-per-hour increase in speed between 30 and 60 miles per hour.

Now Try Exercise 61 ◀

Figure 1.96

The Difference Quotient

The difference quotient often occurs in calculus. It uses function notation to calculate the average rate of change of a function f in general. Consider the graph of $y = f(x)$ shown in Figure 1.96, and let h be a real number. The points $(x, f(x))$ and $(x + h, f(x + h))$ denote the coordinates of two points on this graph. (Figure 1.96 shows $h > 0$.)

The line L passes through these two points and is a *secant line*. The slope m of L is

$$m = \frac{f(x + h) - f(x)}{(x + h) - x} = \frac{f(x + h) - f(x)}{h}.$$

This expression, written in function notation, is called the *difference quotient* and is equal to the average rate of change of f from x to $x + h$.

Difference Quotient

The **difference quotient** of a function f is an expression of the form

$$\frac{f(x + h) - f(x)}{h}, \quad \text{where } h \neq 0.$$

EXAMPLE 5 Calculating a difference quotient

Let $f(x) = x^2 - 2x$.

- Find $f(x + h)$.
- Find the difference quotient of f and simplify the result.

SOLUTION

- To calculate $f(x + h)$, substitute $(x + h)$ for x in the expression $x^2 - 2x$.

$$\begin{aligned} f(x + h) &= (x + h)^2 - 2(x + h) & f(x) &= x^2 - 2x \\ &= x^2 + 2xh + h^2 - 2x - 2h & \text{Square the binomial; apply} \\ & & \text{the distributive property.} \end{aligned}$$

- The difference quotient can be calculated as follows.

$$\begin{aligned} \frac{f(x + h) - f(x)}{h} &= \frac{x^2 + 2xh + h^2 - 2x - 2h - (x^2 - 2x)}{h} && \text{Substitute.} \\ &= \frac{2xh + h^2 - 2h}{h} && \text{Combine like terms.} \\ &= \frac{h(2x + h - 2)}{h} && \text{Factor out } h. \\ &= 2x + h - 2 \end{aligned}$$

Now Try Exercise 75 ◀

EXAMPLE 6 Calculating a difference quotient

Let the distance d in feet that a racehorse runs in t seconds be $d(t) = 2t^2$ for $0 \leq t \leq 10$.

- Find $d(t + h)$.
- Find the difference quotient of d and simplify the result.

Algebra Review

To square a binomial, see Chapter R (page R-18).

- (c) Evaluate the difference quotient for $t = 7$ and $h = 0.1$. Interpret your results.
 (d) Evaluate the difference quotient for $t = 4$ and $h = 1$. Then sketch a graph that illustrates the result.

SOLUTION

- (a) To calculate $d(t + h)$, substitute $(t + h)$ for t in the expression $2t^2$.

$$d(t + h) = 2(t + h)^2 \quad \text{Substitute } (t + h) \text{ for } t.$$

$$= 2(t^2 + 2th + h^2) \quad \text{Square the binomial.}$$

$$= 2t^2 + 4th + 2h^2 \quad \text{Distributive property}$$

$$(b) \frac{d(t + h) - d(t)}{h} = \frac{2t^2 + 4th + 2h^2 - 2t^2}{h} \quad \text{Substitute for } d(t + h) \text{ and } d(t).$$

$$= \frac{4th + 2h^2}{h} \quad \text{Combine like terms.}$$

$$= \frac{h(4t + 2h)}{h} \quad \text{Factor out } h.$$

$$= 4t + 2h \quad \text{Simplify.}$$

- (c) If $t = 7$ and $h = 0.1$, then the difference quotient becomes

$$4t + 2h = 4(7) + 2(0.1) = 28.2.$$

The average rate of change, or average velocity, of the horse from 7 seconds to $7 + 0.1 = 7.1$ seconds is 28.2 feet per second.

- (d) If $t = 4$ and $h = 1$, then $4t + 2h = 4(4) + 2(1) = 18$. Thus the slope of the line passing through $(4, 32)$ and $(5, 50)$ is $m = 18$. See Figure 1.97.

NOTE Because $t = 4$ and $d = 2(4)^2 = 32$, the first point is $(4, 32)$. Because $t = 4$ and $h = 1$, it follows that $t + h = 4 + 1 = 5$ so $d = 2(5)^2 = 50$. The second point is $(5, 50)$.

Now Try Exercise 83 ◀

46. When were water levels decreasing?

Average Rates of Change

Exercises 47–50: Use the graph and formula for $f(x)$ to find the average rates of change of f from -3 to -1 and from 1 to 3 .

47. $f(x) = 4$

48. $f(x) = 2x - 1$

49. $f(x) = -0.3x^2 + 4$ 50. $f(x) = 0.3x^2 - 4$

Exercises 51 and 52: (Refer to Example 3.) Use the given $f(x)$ to complete the following.

- (a) Calculate the average rate of change of f from $x = 1$ to $x = 2$.
 (b) Illustrate your result from part (a) graphically.

51. $f(x) = x^2$ 52. $f(x) = 4 - x^2$

Exercises 53–58: Compute the average rate of change of f from x_1 to x_2 . Round your answer to two decimal places when appropriate. Interpret your result graphically.

53. $f(x) = 7x - 2$, $x_1 = 1$, and $x_2 = 4$

54. $f(x) = -8x + 5$, $x_1 = -2$, and $x_2 = 0$

55. $f(x) = x^3 - 2x$, $x_1 = 2$, and $x_2 = 4$

56. $f(x) = 0.5x^2 - 5$, $x_1 = -1$, and $x_2 = 4$

57. $f(x) = \sqrt{2x - 1}$, $x_1 = 1$, and $x_2 = 3$

58. $f(x) = \sqrt[3]{x + 1}$, $x_1 = 7$, and $x_2 = 26$

59. **U.S. Cigarette Consumption** The following table lists the number of cigarettes in billions consumed in the United States for selected years.

Year	1900	1940	1980	2006
Cigarettes	3	182	632	371

Source: Department of Health and Human Services.

- (a) Find the average rate of change during each time period.
 (b) Interpret the results.
60. **U.S. Alcohol Consumption** The following table lists the annual average number of gallons of pure alcohol consumed by each person age 15 and older in the United States for selected years.

Year	1940	1960	1980	2000
Alcohol	1.56	2.07	2.76	2.18

Source: Department of Health and Human Services.

- (a) Find the average rate of change during each 20-year period.

- (b) Interpret the results.

61. **Falling Object** The distance D in feet that an object has fallen after t seconds is given by $D(t) = 16t^2$.

- (a) Evaluate $D(2)$ and $D(4)$.

- (b) Calculate the average rate of change of D from 2 to 4. Interpret the result.

62. **Torricelli's Law** A cylindrical tank contains 100 gallons of water. A plug is pulled from the bottom of the tank and the amount of water in gallons remaining in the tank after x minutes is given by

$$A(x) = 100 \left(1 - \frac{x}{5} \right)^2.$$

- (a) Calculate the average rate of change of A from 1 to 1.5 and from 2 to 2.5. Interpret your results.

- (b) Are the two average rates of change the same or different? Explain why.

Curve Sketching

Exercises 63–68: **Critical Thinking** Assume that each function is continuous. Do not use a graphing calculator.

63. On the same coordinate axes, sketch the graphs of a constant function f and a nonlinear function g that intersect exactly twice.
64. Sketch a graph of a linear function f that intersects a constant function g exactly once.
65. Sketch a graph of a nonlinear function f that has only positive average rates of change.
66. Sketch a graph of a nonlinear function f that has only negative average rates of change.
67. Sketch a graph of a function that has only positive average rates of change for $x \leq 0$ and only negative average rates of change for $x \geq 0$.
68. Sketch a graph of a function that has only positive average rates of change for $x \geq 1$ and only negative average rates of change for $x \leq 1$.

The Difference Quotient

Exercises 69–82: (Refer to Example 5.) Complete the following for the given $f(x)$.

- (a) Find $f(x + h)$.
 (b) Find the difference quotient of f and simplify.

69. $f(x) = 3$ 70. $f(x) = -5$
 71. $f(x) = -2x$ 72. $f(x) = 10x$
 73. $f(x) = 2x + 1$ 74. $f(x) = -3x + 4$
 75. $f(x) = 3x^2 + 1$ 76. $f(x) = x^2 - 2$
 77. $f(x) = -x^2 + 2x$ 78. $f(x) = -4x^2 + 1$
 79. $f(x) = 2x^2 - x + 1$ 80. $f(x) = x^2 + 3x - 2$
 81. $f(x) = x^3$ 82. $f(x) = 1 - x^3$
83. **Speed of a Car** (Refer to Example 6.) Let the distance in feet that a car travels in t seconds be given by $d(t) = 8t^2$ for $0 \leq t \leq 6$.
 (a) Find $d(t + h)$.
 (b) Find the difference quotient for d and simplify.
 (c) Evaluate the difference quotient when $t = 4$ and $h = 0.05$. Interpret your result.
84. **Draining a Pool** Let the number of gallons G of water in a pool after t hours be given by $G(t) = 4000 - 100t$ for $0 \leq t \leq 40$.
 (a) Find $G(t + h)$.

(b) Find the difference quotient. Interpret your result.

Writing about Mathematics

85. What does the average rate of change represent for a linear function? What does it represent for a nonlinear function? Explain your answers.
86. What is the formula for the difference quotient? Given a formula for $f(x)$, explain how to find $f(x + h)$. Give an example.
87. Suppose that a function f has a positive average rate of change from 1 to 4. Is it correct to assume that function f only increases on the interval $[1, 4]$? Make a sketch to support your answer.
88. If $f(x) = ax + b$, what does the difference quotient for function f equal? Explain your reasoning.

EXTENDED AND DISCOVERY EXERCISE

1. **Velocity** (Refer to Example 6.) If the distance in feet run by a racehorse in t seconds is given by $d(t) = 2t^2$, then the difference quotient for d is $4t + 2h$. How could you estimate the velocity of the racehorse at exactly 7 seconds?

CHECKING BASIC CONCEPTS FOR SECTION 1.5

1. Write each expression in interval notation.
 (a) $x \leq 5$ (b) $1 \leq x < 6$
2. Determine where $f(x) = x^2 - 2$ is increasing and where it is decreasing.
3. Find the average rate of change of $f(x) = x^2 - 3x$ from $x = -3$ to $x = -1$.
4. Find the difference quotient for $f(x) = 4x^2$.

1 Summary

CONCEPT

EXPLANATION AND EXAMPLES

SECTION 1.1 NUMBERS, DATA, AND PROBLEM SOLVING

Sets of Numbers

Natural numbers: $N = \{1, 2, 3, 4, \dots\}$

Integers: $I = \{\dots, -3, -2, -1, 0, 1, 2, 3, \dots\}$

Rational numbers: $\frac{p}{q}$, where p and q are integers with $q \neq 0$; includes repeating and terminating decimals

Irrational numbers: Includes nonrepeating, nonterminating decimals

Real numbers: Any number that can be expressed in decimal form; includes rational and irrational numbers

CONCEPT**EXPLANATION AND EXAMPLES****SECTION 1.1 NUMBERS, DATA, AND PROBLEM SOLVING (CONTINUED)****Order of Operations**

Using the following order of operations, first perform all calculations within parentheses, square roots, and absolute value bars and above and below fraction bars. Then use the same order of operations to perform any remaining calculations.

1. Evaluate all exponents. Then do any negation *after* evaluating exponents.
2. Do all multiplication and division from *left to right*.
3. Do all addition and subtraction from *left to right*.

Example: $5 + 3 \cdot 2^3 = 5 + 3 \cdot 8 = 5 + 24 = 29$

Scientific Notation

A real number r is written as $c \times 10^n$, where $1 \leq |c| < 10$.

Examples: $1234 = 1.234 \times 10^3$ $0.054 = 5.4 \times 10^{-2}$

SECTION 1.2 VISUALIZING AND GRAPHING DATA**Mean (Average) and Median**

The mean represents the average of a set of numbers, and the median represents the middle of a sorted list.

Example: 4, 6, 9, 13, 15; Mean = $\frac{4 + 6 + 9 + 13 + 15}{5} = 9.4$; Median = 9

Relation, Domain, and Range

A relation S is a set of ordered pairs. The domain D is the set of x -values, and the range R is the set of y -values.

Example: $S = \{(-1, 2), (4, -5), (5, 9)\}$; $D = \{-1, 4, 5\}$, $R = \{-5, 2, 9\}$

Cartesian (Rectangular) Coordinate System, or xy -Plane

The xy -plane has four quadrants and is used to graph ordered pairs.

**Distance Formula**

The distance d between the points (x_1, y_1) and (x_2, y_2) is

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}.$$

Example: The distance between $(-3, 5)$ and $(2, -7)$ is

$$d = \sqrt{(2 - (-3))^2 + (-7 - 5)^2} = \sqrt{5^2 + (-12)^2} = 13.$$

CONCEPT

EXPLANATION AND EXAMPLES

SECTION 1.2 VISUALIZING AND GRAPHING DATA (CONTINUED)

Midpoint Formula

The midpoint M of the line segment with endpoints (x_1, y_1) and (x_2, y_2) is

$$M = \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right).$$

Example: The midpoint of the line segment connecting $(1, 2)$ and $(-3, 5)$ is

$$M = \left(\frac{1 + (-3)}{2}, \frac{2 + 5}{2} \right) = \left(-1, \frac{7}{2} \right).$$

Standard Equation of a Circle

The circle with center (h, k) and radius r has the equation

$$(x - h)^2 + (y - k)^2 = r^2.$$

Example: A circle with center $(-2, 5)$ and radius 6 has the equation

$$(x + 2)^2 + (y - 5)^2 = 36.$$

Scatterplot and Line Graph

A scatterplot consists of a set of ordered pairs plotted in the xy -plane. When consecutive points are connected with line segments, a line graph results.

SECTION 1.3 FUNCTIONS AND THEIR REPRESENTATIONS

Function

A function computes exactly one output for each valid input. The set of valid inputs is called the domain D , and the set of outputs is called the range R .

Examples: $f(x) = \sqrt{1 - x}$

$$D = \{x \mid x \leq 1\}, R = \{y \mid y \geq 0\}$$

$$g = \{(-1, 0.5), (0, 4), (2, 4), (6, \pi)\}$$

$$D = \{-1, 0, 2, 6\}, R = \{0.5, \pi, 4\}$$

Function Notation

Examples: $f(x) = x^2 - 4$; $f(3) = 3^2 - 4 = 5$

$$f(a + 1) = (a + 1)^2 - 4 = a^2 + 2a - 3$$

Representations of Functions

A function can be represented symbolically (formula), graphically (graph), numerically (table of values), and verbally (words). Other representations are possible.

Symbolic Representation $f(x) = x^2 - 1$

Numerical Representation

x	y
-2	3
-1	0
0	-1
1	0
2	3

Graphical Representation

Verbal Representation f computes the square of the input x and then subtracts 1.

CONCEPTS AND RESULTS **EXPLANATION AND EXAMPLES**

SECTION 1.3 FUNCTIONS AND THEIR REPRESENTATIONS (CONTINUED)

Vertical Line Test If any vertical line intersects a graph at most once, then the graph represents a function.

SECTION 1.4 TYPES OF FUNCTIONS

Slope The slope m of the line passing through (x_1, y_1) and (x_2, y_2) is

$$m = \frac{\Delta y}{\Delta x} = \frac{y_2 - y_1}{x_2 - x_1}.$$

Example: The slope of the line passing through $(1, -1)$ and $(-2, 3)$ is

$$m = \frac{3 - (-1)}{-2 - 1} = -\frac{4}{3}.$$

Constant Function Given by $f(x) = b$, where b is a constant; its graph is a horizontal line.

Linear Function Given by $f(x) = ax + b$; its graph is a nonvertical line; the slope of its graph is equal to a , which is also equal to its constant rate of change.

Examples: The graph of $f(x) = -8x + 100$ has slope -8 .
If $G(t) = -8t + 100$ calculates the number of gallons of water in a tank after t minutes, then water is *leaving* the tank at 8 gallons per minute.

Nonlinear Function The graph of a nonlinear function is not a line and *cannot* be written as $f(x) = ax + b$.

Examples: $f(x) = x^2 - 4$; $g(x) = \sqrt[3]{x} - 2$; $h(t) = \frac{1}{t + 1}$

Linear and Nonlinear Data If the slopes of the lines passing through consecutive data points are always equal (or nearly equal), then the data are linear. Otherwise the data are nonlinear.

Example: For each 2-unit increase in x , the y -values increase by 10 units. Consecutive slopes between points are $m = \frac{10}{2} = 5$ so the data are linear.

		2 units	2 units	2 units	
		↓	↓	↓	
x	2	4	6	8	
y	0	10	20	30	
		↑	↑	↑	
		10 units	10 units	10 units	

SECTION 1.5 FUNCTIONS AND THEIR RATES OF CHANGE

Interval Notation A concise way to express intervals on the number line

Example: $x < 4$ is expressed as $(-\infty, 4)$.
 $-3 \leq x < 1$ is expressed as $[-3, 1)$.
 $x \leq 2$ or $x \geq 5$ is expressed as $(-\infty, 2] \cup [5, \infty)$.

CONCEPT

EXPLANATION AND EXAMPLES

SECTION 1.5 FUNCTIONS AND THEIR RATES OF CHANGE (CONTINUED)

Increasing/Decreasing

f increases on interval I if, whenever $x_1 < x_2$, $f(x_1) < f(x_2)$.

f decreases on interval I if, whenever $x_1 < x_2$, $f(x_1) > f(x_2)$.

Example: $f(x) = |x|$ increases on $[0, \infty)$ and decreases on $(-\infty, 0]$.

Average Rate of Change

If (x_1, y_1) and (x_2, y_2) are distinct points on the graph of f , then the average rate of change from x_1 to x_2 equals the slope of the line passing through these two points and equals

$$\frac{y_2 - y_1}{x_2 - x_1}$$

Example: $f(x) = x^2$; because $f(2) = 4$ and $f(3) = 9$, the graph of f passes through the points $(2, 4)$ and $(3, 9)$, and the average rate of change from 2 to 3 is given by $\frac{9 - 4}{3 - 2} = 5$.

Difference Quotient

The difference quotient of a function f is an expression of the form

$$\frac{f(x + h) - f(x)}{h}, \text{ where } h \neq 0.$$

Example: Let $f(x) = x^2$. The difference quotient of f is

$$\frac{(x + h)^2 - x^2}{h} = \frac{x^2 + 2xh + h^2 - x^2}{h} = 2x + h.$$

1

Review Exercises

Exercises 1 and 2: Classify each number listed as one or more of the following: natural number, integer, rational number, or real number.

1. $-2, \frac{1}{2}, 0, 1.23, \sqrt{7}, \sqrt{16}$

2. $55, 1.5, \frac{104}{17}, 2^3, \sqrt{3}, -1000$

Exercises 3 and 4: Write each number in scientific notation.

3. 1,891,000

4. 0.0001001

Exercises 5 and 6: Write each number in standard form.

5. 1.52×10^4

6. -7.2×10^{-3}

7. Evaluate each expression with a calculator. Round answers to the nearest hundredth.

(a) $\sqrt[3]{1.2} + \pi^3$

(b) $\frac{3.2 + 5.7}{7.9 - 4.5}$

(c) $\sqrt{5^2 + 2.1}$

(d) $1.2(6.3)^2 + \frac{3.2}{\pi - 1}$

8. Evaluate each expression. Write your answer in scientific notation and in standard form.

(a) $(4 \times 10^3)(5 \times 10^{-5})$

(b) $\frac{3 \times 10^{-5}}{6 \times 10^{-2}}$

Exercises 9 and 10: Evaluate by hand.

9. $4 - 3^2 \cdot 5$ 10. $3 \cdot 3^2 \div \frac{3-5}{6+2}$

Exercises 11 and 12: Sort the list of numbers from smallest to largest and display the result in a table.

- (a) Determine the maximum and minimum values.
(b) Calculate the mean and median.

11. $-5, 8, 19, 24, -23$

12. $8.9, -1.2, -3.8, 0.8, 1.7, 1.7$

Exercises 13 and 14: Complete the following.

- (a) Express the data as a relation S .
(b) Find the domain and range of S .

13.	x	-15	-10	0	5	20
	y	-3	-1	1	3	5

14.	x	-0.6	-0.2	0.1	0.5	1.2
	y	10	20	25	30	80

 Exercises 15 and 16: Make a scatterplot of the relation. Determine if the relation is a function.

15. $\{(10, 13), (-12, 40), (-30, -23), (25, -22), (10, 20)\}$

16. $\{(1.5, 2.5), (0, 2.1), (-2.3, 3.1), (0.5, -0.8), (-1.1, 0)\}$

Exercises 17 and 18: Find the distance between the points.

17. $(-4, 5), (2, -3)$ 18. $(1.2, -4), (0.2, 6)$

Exercises 19 and 20: Find the midpoint of the line segment with the given endpoints.

19. $(24, -16), (-20, 13)$ 20. $(\frac{1}{2}, \frac{5}{4}), (\frac{1}{2}, -\frac{5}{2})$

21. Determine if the triangle with vertices $(1, 2)$, $(-3, 5)$, and $(0, 9)$ is isosceles. (Hint: An isosceles triangle has at least two sides with equal measure.)

22. Find the standard equation of a circle with center $(-5, 3)$ and radius 9.

23. A diameter of a circle has endpoints $(-2, 4)$ and $(6, 6)$. Find the standard equation of the circle.

24. Use the graph at the top of the next column to determine the domain and range of each function. Evaluate $f(-2)$.

Exercises 25–32: Graph $y = f(x)$ by first plotting points to determine the shape of the graph.

25. $f(x) = -2$

26. $f(x) = 3x$

27. $f(x) = -x + 1$

28. $f(x) = 2x - 3$

29. $f(x) = 4 - 2x^2$

30. $f(x) = \frac{1}{2}x^2 - 1$

31. $f(x) = |x + 3|$

32. $f(x) = \sqrt{3 - x}$

Exercises 33 and 34: Use the verbal representation to express the function f symbolically, graphically, and numerically. Let $y = f(x)$ with $0 \leq x \leq 100$. For the numerical representation, use a table with $x = 0, 25, 50, 75, 100$.

33. To convert x pounds to y ounces, multiply x by 16.

34. To find the area y of a square, multiply the length x of a side by itself.

Exercises 35–42: Complete the following for the function f .

(a) Evaluate $f(x)$ at the indicated values of x .

(b) Find the domain of f .

35. $f(x) = \sqrt[3]{x}$ for $x = -8, 1$

36. $f(x) = 3x + 2$ for $x = -2, 5$

37. $f(x) = 5$ for $x = -3, 1.5$

38. $f(x) = 4 - 5x$ for $x = -5, 6$

39. $f(x) = x^2 - 3$ for $x = -10, a + 2$

40. $f(x) = x^3 - 3x$ for $x = -10, a + 1$

41. $f(x) = \frac{1}{x^2 - 4}$ for $x = -3, a + 1$

42. $f(x) = \sqrt{x + 3}$ for $x = 1, a - 3$

43. Determine if y is a function of x in $x = y^2 + 5$.

44. Write $5 \leq x < 10$ in interval notation.

Exercises 45 and 46: Determine if the graph represents a function.

Exercises 47 and 48: Determine if S represents a function.

47. $S = \{(-3, 4), (-1, 2), (3, -5), (4, 2)\}$

48. $S = \{(-1, 3), (0, 2), (-1, 7), (3, -3)\}$

Exercises 49 and 50: State the slope of the graph of f .

49. $f(x) = 7$

50. $f(x) = \frac{1}{3}x - \frac{2}{3}$

Exercises 51–54: If possible, find the slope of the line passing through each pair of points.

51. $(-1, 7), (3, 4)$

52. $(1, -4), (2, 10)$

53. $(8, 4), (-2, 4)$

54. $(-\frac{1}{3}, \frac{2}{3}), (-\frac{1}{3}, -\frac{5}{6})$

Exercises 55–58: Decide whether the function f is constant, linear, or nonlinear. Support your answer graphically.

55. $f(x) = 8 - 3x$

56. $f(x) = 2x^2 - 3x - 8$

57. $f(x) = |x + 2|$

58. $f(x) = 6$

59. Sketch a graph for a 2-hour period showing the distance between two cars meeting on a straight highway, each traveling 60 miles per hour. Assume that the cars are initially 120 miles apart.

60. Determine where the graph of $f(x) = |x - 3|$ is increasing and where it is decreasing.

61. Determine if the following data are modeled best by a constant, linear, or nonlinear function.

x	-2	0	2	4
y	50	42	34	26

62. Find the average rate of change of $f(x) = x^2 - x + 1$ from $x_1 = 1$ to $x_2 = 3$.

Exercises 63 and 64: Find the difference quotient for $f(x)$.

63. $f(x) = 5x + 1$

64. $f(x) = 3x^2 - 2$

Applications

65. **Speed of Light** The average distance between the planet Mars and the sun is approximately 228 million kilometers. Estimate the time required for sunlight, traveling at 300,000 kilometers per second, to reach Mars. (Source: C. Ronan, *The Natural History of the Universe*.)

66. **Geometry** Suppose that 0.25 cubic inch of paint is applied to a circular piece of plastic with a diameter of 20 inches. Estimate the thickness of the paint.

67. **Enclosing a Pool** A rectangular swimming pool that is 25 feet by 50 feet has a 6-foot-wide sidewalk around it.

(a) How much fencing would be needed to enclose the sidewalk?

(b) Find the area of the sidewalk.

68. **Distance** A driver's distance D in miles from a rest stop after t hours is given by $D(t) = 280 - 70t$.

(a) How far is the driver from the rest stop after 2 hours?

(b) Find the slope of the graph of D . Interpret this slope as a rate of change.

69. **Survival Rates** The survival rates for song sparrows are shown in the table. The values listed are the numbers of song sparrows that attain a given age from 100 eggs. For example, 6 sparrows reach an age of 2 years from 100 eggs laid in the wild. (Source: S. Kress, *Bird Life*.)

Age	0	1	2	3	4
Number	100	10	6	3	2

(a) Make a line graph of the data. Interpret the data.

(b) Does this line graph represent a function?

(c) Calculate and interpret the average rate of change for each 1-year period.

70. **Cost of Tuition** The graph shows the cost of taking x credits at a university.

- (a) Why is it reasonable for the graph to pass through the origin?
- (b) Find the slope of the graph.
- (c) Interpret the slope as a rate of change.

71. **Average Rate of Change** Let $f(x) = 0.5x^2 + 50$ represent the outside temperature in degrees Fahrenheit at x P.M., where $1 \leq x \leq 5$.

- (a) Graph f . Is f linear or nonlinear?
- (b) Calculate the average rate of change of f from 1 P.M. to 4 P.M.
- (c) Interpret this average rate of change verbally and graphically.

72. **Distance** At noon car A is traveling north at 30 miles per hour and is located 20 miles north of car B. Car B is traveling west at 50 miles per hour. Approximate the distance between the cars at 12:45 P.M. to the nearest mile.

EXTENDED AND DISCOVERY EXERCISES

Because a parabolic curve becomes sharp gradually, as shown in the first figure, curves designed by engineers for highways and railroads frequently have parabolic, rather than circular, shapes. If railroad tracks changed abruptly from straight to circular, the momentum of the locomotive could cause a derailment. The second figure illustrates straight tracks connecting to a circular curve. (Source: F. Mannering and W. Kilareski, *Principles of Highway Engineering and Traffic Analysis*.)

In order to design a curve and estimate its cost, engineers determine the distance around the curve before it is built. In the third figure the distance along a parabolic curve from A to C is approximated by two line segments AB and BC . The distance formula can be used to calculate the length of each segment. The sum of these two lengths gives a crude estimate of the length of the curve.

A Parabolic Curve

A Circular Curve

An Estimate of Curve Length

A Better Estimate

A better estimate can be made using four line segments, as shown in the fourth figure. As the number of segments increases, so does the accuracy of the approximation.

1. **Curve Length** Suppose that a curve designed for railroad tracks is represented by the equation $y = 0.2x^2$, where the units are in kilometers. The points $(-3, 1.8)$, $(-1.5, 0.45)$, $(0, 0)$, $(1.5, 0.45)$, and $(3, 1.8)$ lie on the graph of $y = 0.2x^2$. Approximate the length of the curve from $x = -3$ to $x = 3$ by using line segments connecting these points.

Exercises 2–5: Curve Length Use three line segments connecting the four points to estimate the length of the curve on the graph of f from $x = -1$ to $x = 2$. Graph f and a line graph of the four points in the indicated viewing rectangle.

2. $f(x) = x^2$; $(-1, 1)$, $(0, 0)$, $(1, 1)$, $(2, 4)$;
 $[-4.5, 4.5, 1]$ by $[-1, 5, 1]$
3. $f(x) = \sqrt[3]{x}$; $(-1, -1)$, $(0, 0)$, $(1, 1)$, $(2, \sqrt[3]{2})$;
 $[-3, 3, 1]$ by $[-2, 2, 1]$
4. $f(x) = 0.5x^3 + 2$; $(-1, 1.5)$, $(0, 2)$, $(1, 2.5)$, $(2, 6)$;
 $[-4.5, 4.5, 1]$ by $[0, 6, 1]$

5. $f(x) = 2 - 0.5x^2$; $(-1, 1.5)$, $(0, 2)$, $(1, 1.5)$, $(2, 0)$; $[-3, 3, 1]$ by $[-1, 3, 1]$
6. The distance along the curve of $y = x^2$ from $(0, 0)$ to $(3, 9)$ is about 9.747. Use this fact to estimate the distance along the curve of $y = 9 - x^2$ from $(0, 9)$ to $(3, 0)$.
7. Estimate the distance along the curve of $y = \sqrt{x}$ from $(1, 1)$ to $(4, 2)$. (The actual value is approximately 3.168.)

-  8. **Endangered Species** The Florida scrub-jay is an endangered species that prefers to live in open landscape with short vegetation. NASA has attempted to create a habitat for these birds near Kennedy Space Center. The following table lists their population for selected years, where $x = 0$ corresponds to 1980, $x = 1$ to 1981, $x = 2$ to 1982, and so on.

x (1980 \leftrightarrow 0)	0	5	9
y (population)	3697	2512	2176
x (1980 \leftrightarrow 0)	11	15	19
y (population)	2100	1689	1127

Source: *Mathematics Explorations II*, NASA-AMATYC-NSF.

- (a) Make a scatterplot of the data.
- (b) Find a linear function f that models the data.

- (c) Graph the data and f in the same viewing rectangle.
- (d) Estimate the scrub-jay population in 1987 and in 2003.

9. **Global Warming** If the global climate were to warm significantly as a result of the greenhouse effect or other climatic change, the Arctic ice cap would start to melt. It is estimated that this ice cap contains the equivalent of 680,000 cubic miles of water. Over 200 million people currently live on soil that is less than 3 feet above sea level. In the United States, several large cities have low average elevations, such as Boston (14 feet), New Orleans (4 feet), and San Diego (13 feet). (Sources: Department of the Interior, Geological Survey.)
- (a) Devise a plan to determine how much sea level would rise if the Arctic cap melted. (*Hint:* The radius of Earth is 3960 miles and 71% of its surface is covered by oceans.)
- (b) Use your plan to estimate this rise in sea level.
- (c) Discuss the implications of your calculation.
- (d) Estimate how much sea level would rise if the 6,300,000 cubic miles of water in the Antarctic ice cap melted.
10. Prove that $\sqrt{2}$ is irrational by assuming that $\sqrt{2}$ is rational and arriving at a contradiction.

2

Linear Functions and Equations

For over two centuries people have been transferring carbon from below the surface of the earth into the atmosphere. Today, the burning of coal, oil, and natural gas releases 7 billion tons of carbon into the atmosphere each year. If the current rate of growth continues, the amount could double to 14 billion tons by 2056. This increase is modeled by a linear function C in the figure on the left below. The horizontal line $y = 7$ represents the 2006 level of emissions, and the horizontal line $y = 14$ represents a doubling of carbon emissions. Their points of

intersection with the graph of C represent when these levels of emission could occur. The figure on the right illustrates what might happen if levels of carbon emission could be held at the 2006 rate of 7 billion tons per year for the next 50 years. In this case, emissions are expected to decline after 50 years. This graph, made up of line segments, is called a *piecewise-linear function*.

The human mind has never
invented a labor-saving device
greater than algebra.

—J. W. Gibbs

Whatever your point of view, mathematics plays an essential role in understanding the future of carbon emissions; without mathematical support, predictions lack credibility. To model carbon emissions, we need constant, linear, and piecewise-defined functions. All of these important concepts are discussed in this chapter.

2.1 Linear Functions and Models

- Understand how functions can be models
- Identify a graph or table of a linear function
- Model data with a linear function
- Evaluate and graph piecewise-defined functions
- Evaluate and graph the greatest integer function
- Use linear regression to model data (optional)

Introduction

Throughout history, people have attempted to explain the world around them by creating models. A model is based on observations. It can be a diagram, a graph, an equation, a verbal expression, or some other form of communication. Models are used in diverse areas such as economics, physics, chemistry, astronomy, religion, and mathematics. Regardless of where it is used, a **model** is an *abstraction* with the following two characteristics:

1. A model is able to explain present phenomena. It should not contradict data and information already known to be correct.
2. A model is able to make predictions about data or results. It should use current information to forecast phenomena or create new information.

Mathematical models are used to forecast business trends, design the shapes of cars, estimate ecological trends, control highway traffic, describe epidemics, predict weather, and discover new information when human knowledge is inadequate.

Functions as Models

A function can sometimes be a model. Worldwide, people purchased and downloaded 420 million tracks of music in 2005, and this number increased to 795 million in 2007. (**Source:** International Federation of the Phonographic Industry.) If $t = 0$ corresponds to 2005, $t = 1$ to 2006, and so on, then the linear function D defined by $D(t) = 187.5t + 420$ accurately *models* these *known* data values because

$$D(0) = 187.5(0) + 420 = 420 \quad \text{and} \quad D(2) = 187.5(2) + 420 = 795.$$

We might use function D as a model to *predict* the downloads in 2006 by evaluating $D(1)$.

$$D(1) = 187.5(1) + 420 = 607.5$$

Thus D estimates that **607.5** million tracks of music were downloaded in 2006. Because 2006 is between 2005 and 2007, this calculated value is likely to be more accurate than if we used D to estimate the number of downloads many years into the future or the past. For example, to predict downloads in 2011 we might let $t = 6$ ($2005 + 6 = 2011$), and to predict downloads in 2001 we might let $t = -4$ ($2005 - 4 = 2001$).

$$D(6) = 187.5(6) + 420 = 1545$$

$$D(-4) = 187.5(-4) + 420 = -330$$

This model predicts that **1545** million tracks will be downloaded in 2011, which may or may not be correct. However, this model also estimates that **−330** million tracks were downloaded in 2001, which is clearly incorrect.

Estimating values between data points, such as for 2006, is called **interpolation**, and estimating values “outside” of the given data points, such as for 2001 or 2011, is called **extrapolation**. Interpolation tends to be more accurate than extrapolation. Typically, for a model to be accurate, it must have limits on its domain. For example, it might be reasonable to limit the domain of D to $t = 0, 1, 2, 3$, or 4 .

Representations of Linear Functions

Any linear function can be written as $f(x) = ax + b$, where a equals the slope of the graph of f . Also, because $f(0) = a(0) + b = b$, the point $(0, b)$ lies on the graph of f and the value of b is the **y-intercept** of the graph of f .

Consider the graph of the linear function f shown in Figure 2.1. The graph is a line that intersects each axis once. From the graph we can see that when y increases by 3 units, x increases by 2 units. Thus the change in y is $\Delta y = 3$, the change in x is $\Delta x = 2$, and the slope is $\frac{\Delta y}{\Delta x} = \frac{3}{2}$. The graph f intersects the y -axis at the point $(0, 3)$, and so the y -intercept is 3.

Using this information, we can write a formula, or symbolic representation, of f as

$$f(x) = \frac{3}{2}x + 3.$$

↖
↗
 slope y-intercept

A function can have at most one y -intercept because $f(0)$ can have at most one value.

The graph of f in Figure 2.1 intersects the x -axis at the point $(-2, 0)$. We say that the **x-intercept** on the graph of f is **−2**. When we evaluate $f(-2)$, we obtain

$$f(-2) = \frac{3}{2}(-2) + 3 = 0.$$

An x -intercept corresponds to an input that results in an output of 0. We also say that -2 is a **zero** of the function f , since $f(-2) = 0$. A **zero** of a function f corresponds to an x -intercept on the graph of f . If the slope of the graph of a linear function f is not 0, then the graph of f has exactly one x -intercept.

A table of values, or numerical representation, for $f(x) = \frac{3}{2}x + 3$ is shown in Table 2.1. Note that for every 1-unit increase in x , $f(x)$ increases by $\frac{3}{2}$, or 1.5, units.

Table 2.1 $f(x) = \frac{3}{2}x + 3$

x	−2	−1	0	1	2
$f(x)$	0	1.5	3	4.5	6
		1.5	1.5	1.5	1.5

In general, for each 1-unit increase in x , a linear function g , given by $g(x) = ax + b$, changes by a units. When $a > 0$ the graph of g is increasing for all real numbers x , and when $a < 0$ the graph of g is decreasing for all real numbers x . Linear functions either *always increase* or *always decrease* on their domains, provided $a \neq 0$. If $a = 0$, then g is a constant function.

Figure 2.1 Linear Function

Figure 2.2

EXAMPLE 1 Finding a formula from a graph

Use the graph of a linear function f in Figure 2.2 to complete the following.

- Find the slope, y -intercept, and x -intercept.
- Write a formula for f .
- Find any zeros of f .

SOLUTION

- The line **falls 1** unit each time the x -values increase by **4** units. Therefore the slope is $-\frac{1}{4}$. The graph intersects the y -axis at the point $(0, -1)$ and intersects the x -axis at the point $(-4, 0)$. Therefore the y -intercept is -1 , and the x -intercept is -4 .
- Because the slope is $-\frac{1}{4}$ and the y -intercept is -1 , it follows that

$$f(x) = -\frac{1}{4}x - 1.$$

- Zeros of f correspond to x -intercepts, so the only zero is -4 .

Now Try Exercise 13 ◀

Modeling with Linear Functions

Linear functions can be used to model things that change at a constant rate. For example, the distance traveled by a car can be modeled by a linear function *if* the car is traveling at a constant speed.

Modeling with a Linear Function

To model a quantity that is changing at a constant rate with $f(x) = ax + b$, the following formula may be used.

$$f(x) = (\text{constant rate of change})x + (\text{initial amount})$$

The constant rate of change corresponds to the slope of the graph of f , and the initial amount corresponds to the y -intercept.

This method is illustrated in the next two examples.

EXAMPLE 2 Writing formulas for functions

Write the formula for a linear function that models each situation. Choose both an appropriate name and an appropriate variable for the function. State what the input variable represents and the domain of the function.

- In 2006 the average cost of attending a private college was \$30,000, and it is projected to increase, on average, by \$1750 per year until 2010. (Source: CNNMoney.com.)
- A car's speed is 50 miles per hour, and it begins to slow down at a constant rate of 10 miles per hour each second.

SOLUTION

- Getting Started** To model cost with a linear function, we need to find two quantities: the initial amount and the rate of change. In this example the initial amount is \$30,000 and the rate of change is \$1750 per year. ▶

Let C be the name of the function and x be the number of years after 2006. Then

$$\begin{aligned} C(x) &= (\text{constant rate of change})x + (\text{initial amount}) \\ &= 1750x + 30,000 \end{aligned}$$

models the cost in dollars of attending a private college x years after 2006. Because this projection is valid only until 2010, or for 4 years past 2006, the domain D of function C is

$$D = \{x \mid x = 0, 1, 2, 3, \text{ or } 4\}.$$

Note that x represents a year, so it may be most appropriate to restrict the domain to integer values for x .

- (b) Let S be the name of the function and t be the elapsed time in seconds that the car has been slowing down. Then

$$\begin{aligned} S(t) &= (\text{constant rate of change})t + (\text{initial speed}) \\ &= -10t + 50 \end{aligned}$$

models the speed of the car after an elapsed time of t seconds. Because the car's initial speed is 50 miles per hour and it slows at 10 miles per hour per second, the car can slow down for at most 5 seconds before it comes to a stop. Thus the domain D of S is

$$D = \{t \mid 0 \leq t \leq 5\}.$$

Note that t represents time in seconds, so t does not need to be restricted to an integer.

Now Try Exercises 49 and 51 ◀

EXAMPLE 3 Finding a symbolic representation

A 100-gallon tank, initially full of water, is being drained at a rate of 5 gallons per minute.

- Write a formula for a linear function f that models the number of gallons of water in the tank after x minutes.
- How much water is in the tank after 4 minutes?
- Graph f . Identify the x - and y -intercepts and interpret each.
- Discuss the domain of f .

SOLUTION

- (a) The amount of water in the tank is *decreasing* at 5 gallons per minute, so the constant rate of change is -5 . The initial amount of water is 100 gallons.

$$\begin{aligned} f(x) &= (\text{constant rate of change})x + (\text{initial amount}) \\ &= -5x + 100 \end{aligned}$$

- After 4 minutes the tank contains $f(4) = -5(4) + 100 = 80$ gallons.
- Since $f(x) = -5x + 100$, the graph has y -intercept 100 and slope -5 , as shown in Figure 2.3. The x -intercept is 20, which corresponds to the time in minutes that it takes to empty the tank. The y -intercept corresponds to the gallons of water initially in the tank.
- From the graph we see that the domain of f must be restricted to $0 \leq x \leq 20$. For example, 21 is not in the domain of f because $f(21) = -5(21) + 100 = -5$; the tank cannot hold -5 gallons. Similarly, -1 is not in the domain of f because $f(-1) = -5(-1) + 100 = 105$; the tank holds *at most* 100 gallons.

Now Try Exercise 55 ◀

Figure 2.3

If the slopes between consecutive pairs of data points are always the same, the data can be modeled exactly by a linear function. If the slopes between consecutive pairs of data

points are nearly the same, then the data can be modeled approximately by a linear function. In the next example we model data approximately.

EXAMPLE 4 Modeling airliner CO₂ emissions

Airliners emit carbon dioxide into the atmosphere when they burn jet fuel. Table 2.2 shows the *average* number y of pounds of carbon dioxide (CO₂) emitted by an airliner for each passenger who flies a distance of x miles.

Table 2.2 Carbon Dioxide Emissions

x (miles)	240	360	680	800
y (pounds)	150	230	435	510

Source: E. Rogers and T. Kostigen, *The Green Book*.

- Calculate the slopes of the line segments that connect consecutive data points.
- Find a linear function f that models the data.
- Graph f and the data. What does the slope of the graph of f indicate?
- Calculate $f(1000)$ and interpret the result.

SOLUTION

- (a) The slopes of the lines passing through the points (240, 150), (360, 230), (680, 435), and (800, 510) are as follows:

$$m_1 = \frac{230 - 150}{360 - 240} \approx 0.67, \quad m_2 = \frac{435 - 230}{680 - 360} \approx 0.64, \quad \text{and}$$

$$m_3 = \frac{510 - 435}{800 - 680} \approx 0.63.$$

- (b) **Getting Started** A linear function can be written as $f(x) = ax + b$. We need to estimate values for a and b . One possibility for a is to find the average of m_1 , m_2 , and m_3 . The value of b equals the y -intercept. ▶

The average of 0.67, 0.64, and 0.63 is 0.65, rounded to the nearest hundredth. Because traveling 0 miles produces 0 pounds of carbon dioxide, let the graph of f pass through (0, 0). Thus the y -intercept is 0 and $f(x) = 0.65x + 0$, where $a = 0.65$ and $b = 0$. Note that answers may vary slightly.

- (c) A graph of the four data points and $f(x) = 0.65x$ is shown in Figure 2.4. The slope of 0.65 indicates that, on average, 0.65 pound of carbon dioxide is produced for each mile that a person travels in an airliner.
- (d) $f(1000) = 0.65(1000) = 650$; thus **650** pounds of carbon dioxide are emitted into the atmosphere, on average, when a person flies **1000** miles. **Now Try Exercise 61** ◀

Figure 2.4

Calculator Help

To make a scatterplot, see Appendix A (page AP-3). To plot data and graph an equation in the same viewing rectangle, see Appendix A (page AP-7).

MAKING CONNECTIONS

Slope and Approximately Linear Data Another way to obtain an initial value for a is to calculate the slope between the first and last data point in the table. The value for a can then be adjusted visually by graphing f and the data. In Example 4 this would have resulted in

$$a = \frac{510 - 150}{800 - 240} \approx 0.64,$$

which compares favorably with our decision to let $a = 0.65$.

Piecewise-Defined Functions

When a function f models data, there may not be one formula for $f(x)$ that works. In this case, the function is sometimes defined on pieces of its domain and is therefore called a **piecewise-defined function**. If each piece is linear, the function is a **piecewise-linear function**. An example of a piecewise-defined function is the *Fujita scale*, which classifies tornadoes by intensity. If a tornado has wind speeds between 40 and 72 miles per hour, it is an F1 tornado. Tornadoes with wind speeds greater than 72 miles per hour but not more than 112 miles per hour are F2 tornadoes. The Fujita scale is represented by the following function F , where the input x represents the maximum wind speed of a tornado and the output is the F-scale number from 1 to 5.

$$F(x) = \begin{cases} 1 & \text{if } 40 \leq x \leq 72 \\ 2 & \text{if } 72 < x \leq 112 \\ 3 & \text{if } 112 < x \leq 157 \\ 4 & \text{if } 157 < x \leq 206 \\ 5 & \text{if } 206 < x \leq 260 \end{cases} \quad \leftarrow F(180) = 4$$

Figure 2.5

For example, if the maximum wind speed is 180 miles per hour, then $F(180) = 4$ because 180 is between 157 and 206; that is, $157 < 180 \leq 206$. Thus a tornado with a maximum wind speed of 180 miles per hour is an F4 tornado.

A graph of $y = F(x)$ is shown in Figure 2.5. It is composed of horizontal line segments. Because each piece is constant, F is sometimes called a **piecewise-constant function** or a **step function**. A solid dot occurs at the point $(72, 1)$ and an open circle occurs at the point $(72, 2)$, because technically a tornado with 72-mile-per-hour winds is an F1 tornado, not an F2 tornado. An open circle indicates that the point is *not* included in the graph of F .

You can draw the graph of a continuous function without picking up your pencil. Because there are breaks in the graph of F , function F is not continuous; rather, it is **discontinuous** at $x = 72, 112, 157$, and 206 .

EXAMPLE 3 Evaluating a graphical representation

Figure 2.6 depicts a graph of a piecewise-linear function f . It models the amount of water in thousands of gallons in a swimming pool after x hours have elapsed.

- Use the graph to evaluate $f(0)$, $f(25)$, and $f(40)$. Interpret the results.
- Discuss how the amount of water in the pool changed. Is f a continuous function on the interval $[0, 50]$?
- Interpret the slope of each line segment in the graph.
- Identify where f is increasing, decreasing, or constant.

SOLUTION

- From Figure 2.6, when $x = 0$, $y = 2$, so $f(0) = 2$. Initially, there are 2 thousand gallons of water in the pool. The points $(25, 8)$ and $(40, 4)$ lie on the graph of f . Therefore $f(25) = 8$ and $f(40) = 4$. After 25 hours there were 8 thousand gallons in the pool, and after 40 hours there were 4 thousand gallons.
- During the first 20 hours, water in the pool increased at a constant rate from 2 thousand to 8 thousand gallons. For the next 10 hours, the water level was constant. Between 30 and 50 hours, the pool was drained at a constant rate. Since there are no breaks in the graph, f is a continuous function on the interval $[0, 50]$.
- Slope indicates the rate at which water is entering or leaving the pool. The first line segment connects the points $(0, 2)$ and $(20, 8)$. Its slope is $m = \frac{8-2}{20-0} = 0.3$. Since

Figure 2.6 Water in a Pool

the units are thousands of gallons and hours, water is entering the pool during this time at 300 gallons per hour. Between 20 and 30 hours the slope of the line segment is 0. Water is neither entering nor leaving the pool. The slope of the line segment connecting the points (30, 8) and (50, 0) is $m = \frac{0 - 8}{50 - 30} = -0.4$. On this interval water is leaving the pool at 400 gallons per hour.

- (d) Function f is increasing for $0 \leq x \leq 20$, decreasing for $30 \leq x \leq 50$, and constant for $20 \leq x \leq 30$. These intervals correspond to when the water level in the pool is increasing, decreasing, or remaining constant.

Now Try Exercise 67

EXAMPLE 4 Evaluating and graphing a piecewise-defined function

Use $f(x)$ to complete the following.

$$f(x) = \begin{cases} x - 1 & \text{if } -4 \leq x < 2 \\ -2x & \text{if } 2 \leq x \leq 4 \end{cases}$$

- (a) What is the domain of f ? (b) Evaluate $f(-3)$, $f(2)$, $f(4)$, and $f(5)$.
 (c) Sketch a graph of f . (d) Is f a continuous function on its domain?

SOLUTION

- (a) Function f is defined for x -values satisfying either $-4 \leq x < 2$ or $2 \leq x \leq 4$. Thus the domain of f is $D = \{x \mid -4 \leq x \leq 4\}$, or $[-4, 4]$.
 (b) For x -values satisfying $-4 \leq x < 2$, $f(x) = x - 1$ and so $f(-3) = -3 - 1 = -4$. Similarly, if $2 \leq x \leq 4$, then $f(x) = -2x$. Thus $f(2) = -2 \cdot 2 = -4$ and $f(4) = -2 \cdot 4 = -8$. The expression $f(5)$ is undefined because 5 is not in the domain of f .
 (c) **Getting Started** Because each piece of $f(x)$ is linear, the graph of $y = f(x)$ consists of two line segments. Therefore we can find the endpoints of each line segment and then sketch the graph. ▶

The first piece is $y_1 = x - 1$ for $-4 \leq x < 2$. If $x = -4$, then $y_1 = -5$, and if $x = 2$, then $y_1 = 1$. Thus the endpoints for the first line segment are $(-4, -5)$ and $(2, 1)$. Plot a solid dot at $(-4, -5)$ because $(-4, -5)$ is included, and an open circle at $(2, 1)$, because $(2, 1)$ is *not included* in this piece of the function. Sketch a line segment between these points, as shown in Figure 2.7.

The second piece is $y_2 = -2x$ for $2 \leq x \leq 4$. If $x = 2$, then $y_2 = -4$, and if $x = 4$, then $y_2 = -8$. Thus the endpoints are $(2, -4)$ and $(4, -8)$. Plot a solid dot for each and connect these points with a line segment, as shown in Figure 2.8.

- (d) The function f is not continuous because there is a break in its graph at $x = 2$.

Now Try Exercise 71

Figure 2.7

Figure 2.8

The Greatest Integer Function

A common piecewise-defined function used in mathematics is the greatest integer function, denoted $f(x) = [x]$. The **greatest integer function** is defined as follows.

$[x]$ is the greatest integer less than or equal to x .

Some examples of the evaluation of $[x]$ include

$$[6.7] = 6, \quad [3] = 3, \quad [-2.3] = -3, \quad [-10] = -10, \quad \text{and} \quad [-\pi] = -4.$$

The graph of $y = [x]$ is shown in Figure 2.9 on the next page. The greatest integer function is both a piecewise-constant function and a step function.

Calculator Help

To access the greatest integer function or to set a calculator in dot mode, see Appendix A (pages AP-7 and AP-8).

Figure 2.9 The Greatest Integer Function

$$[x] = \begin{cases} \vdots & \\ -2 & \text{if } -2 \leq x < -1 \\ -1 & \text{if } -1 \leq x < 0 \\ 0 & \text{if } 0 \leq x < 1 \\ 1 & \text{if } 1 \leq x < 2 \\ 2 & \text{if } 2 \leq x < 3 \\ \vdots & \end{cases}$$

In some applications, fractional parts are either not allowed or ignored. Framing lumber for houses is measured in 2-foot multiples, and mileage charges for rental cars may be calculated to the mile.

Suppose a car rental company charges \$31.50 per day plus \$0.25 for each mile driven, where fractions of a mile are ignored. The function given by $f(x) = 0.25[x] + 31.50$ calculates the cost of driving x miles in one day. For example, the cost of driving 100.4 miles is

$$f(100.4) = 0.25[100.4] + 31.50 = 0.25(100) + 31.50 = \$56.50.$$

On some calculators and computers, the greatest integer function is denoted $\text{int}(X)$. A graph of $Y_1 = 0.25 \cdot \text{int}(X) + 31.5$ is shown in Figure 2.10.

[0, 10, 1] by [31, 35, 1]

Figure 2.10 Dot Mode

[0, 10, 1] by [31, 35, 1]

Figure 2.11 Connected Mode

MAKING CONNECTIONS

Connected and Dot Modes Graphing calculators often connect points to make a graph look continuous. However, if a graph has breaks in it, a graphing calculator may connect points where there should be breaks. In *dot mode*, points are plotted but not connected. Figure 2.11 is the same graph shown in Figure 2.10, except that it is plotted in *connected mode*. Note that connected mode generates an inaccurate graph of this step function.

Linear Regression (Optional)

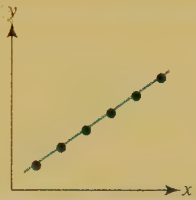

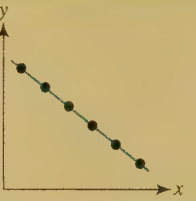

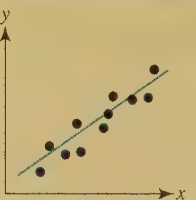

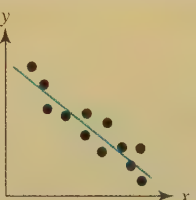

We have used linear functions to model data involving the variables x and y . Unknown values for y were predicted at given values of x . Problems where one variable is used to predict the behavior of a second variable are called **regression** problems. If a linear function or line is used to approximate the data, then the technique is referred to as **linear regression**.

We have already solved problems by selecting a line that *visually* fits the data in a scatterplot. However, this technique has some disadvantages. First, it does not produce a unique line. Different people may arrive at different lines to fit the same data. Second, the line is not determined automatically by a calculator or computer. A person must view the data and adjust the line until it “fits.” By contrast, a statistical method used to determine a unique linear function or line is based on **least squares**.

Correlation Coefficient Most graphing calculators have the capability to calculate the least-squares regression line automatically after the data points have been entered. When determining the least-squares line, calculators often compute a real number r , called

the **correlation coefficient**, where $-1 \leq r \leq 1$. When r is positive and near 1, low x -values correspond to low y -values and high x -values correspond to high y -values. For example, there is a positive correlation between years of education x and income y . More years of education correlate with higher income. When r is near -1 , the reverse is true. Low x -values correspond to high y -values and high x -values correspond to low y -values. An example is the relation between latitude and average yearly temperature. As latitude increases (moving toward either the north or the south pole), the average yearly temperature decreases. Therefore there will be a negative correlation between latitude and average yearly temperature. If $r \approx 0$, then there is little or no correlation between the data points. In this case, a linear function does not provide a suitable model. A summary of these concepts is shown in Table 2.3.

Table 2.3 Correlation Coefficient r ($-1 \leq r \leq 1$)

Value of r	Comments	Sample Scatterplot
$r = 1$	There is an exact linear fit. The line passes through all data points and has a positive slope.	
$r = -1$	There is an exact linear fit. The line passes through all data points and has a negative slope.	
$0 < r < 1$	There is a positive correlation. As the x -values increase, so do the y -values. The fit is not exact.	
$-1 < r < 0$	There is a negative correlation. As the x -values increase, the y -values decrease. The fit is not exact.	
$r = 0$	There is no correlation. The data has no tendency toward being linear. A regression line predicts poorly.	

MAKING CONNECTIONS

Correlation and Causation When geese begin to fly north, summer is coming and the weather becomes warmer. Geese flying north correlates with warmer weather. However, geese flying north clearly does not *cause* warmer weather. It is important to remember that correlation does not always indicate the cause.

Calculator Help

To find a line of least-squares fit, see Appendix A (page AP-8).

In the next example we use a graphing calculator to find the line of least-squares fit that models three data points.

EXAMPLE 7 Determining a line of least-squares fit

Find the line of least-squares fit for the data points (1, 1), (2, 3), and (3, 4). What is the correlation coefficient? Plot the data and graph the line.

SOLUTION Begin by entering the three data points into the STAT EDIT menu. Refer to Figures 2.12–2.15. Select the LinReg(ax + b) option from the STAT CALC menu. From the home screen we can see that the line (linear function) of least-squares is given by the formula $y = \frac{3}{2}x - \frac{1}{3}$. The correlation coefficient is $r \approx 0.98$. Since $r \neq 1$, the line does not provide an *exact* model of the data.

Now Try Exercise 85 ◀

An Application In the next example we use regression to find a linear function that models numbers of airline passengers at some of the largest U.S. airports.

EXAMPLE 8 Predicting airline passengers

Table 2.4 lists the numbers in millions of airline passengers at some of the largest airports in the United States during 2002 and 2006.

- Graph the data by using the 2002 data for x -values and the corresponding 2006 data for y -values. Predict whether the correlation coefficient will be positive or negative.
- Use a calculator to find the linear function f based on least-squares regression that models the data. Graph $y = f(x)$ and the data in the same viewing rectangle.
- In 2002 Newark International Airport had 29.0 million passengers. Assuming that this airport followed a trend similar to that of the five airports listed in Table 2.4, use your linear function to estimate the number of passengers at Newark International in 2006. Compare this result to the actual value of 36.7 million passengers.

Table 2.4 Airline Passengers (millions)

Airport	2002	2006
Atlanta (Hartsfield)	76.9	84.4
Chicago (O'Hare)	66.5	77.0
Los Angeles (LAX)	56.2	61.0
Dallas/Fort Worth	52.8	60.2
Denver	35.7	47.3

Source: Airports Association Council International.

SOLUTION

- (a) A scatterplot of the data is shown in Figure 2.16. Because increasing x -values correspond to increasing y -values, the correlation coefficient will be positive.
- (b) Because $y = f(x)$, the formula for a linear function f that models the data is given by $f(x) = 0.9384x + 11.9098$, where coefficients have been rounded to four decimal places. See Figure 2.17. Graphs of f and the data are shown in Figure 2.18.
- (c) We can use $f(x)$ to predict y when $x = 29.0$.

$$y = f(29.0) = 0.9384(29.0) + 11.9098 \approx 39.1 \text{ million}$$

This value is more than the actual value of 36.7 million.

To copy the regression equation directly into Y_1 , see Appendix A (page AP-13).

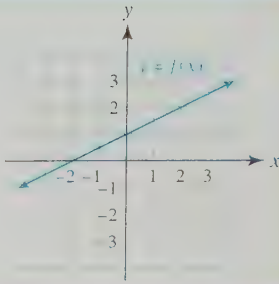

2.1 Putting It All Together

The following table summarizes important concepts.

Concept	Description
Models	A good model describes and explains current data. It should also make predictions and forecast phenomena.
Linear model	If a quantity experiences a constant rate of change, then it can be modeled by a linear function in the form $f(x) = ax + b$. $f(x) = (\text{constant rate of change})x + (\text{initial value})$

continued on next page

continued from previous page

Concept	Description
Graph of a linear function	<p>The graph of a linear function is a line. If $f(x) = ax + b$, then the slope equals a and the y-intercept equals b. The following graph has slope $\frac{1}{2}$, y-intercept 1, and formula $f(x) = \frac{1}{2}x + 1$. The zero of f is the x-intercept, -2.</p> 
Piecewise-defined function	<p>A function is piecewise-defined if it has different formulas on different intervals of its domain. Many times the domain is restricted.</p> $f(x) = \begin{cases} 2x - 3 & \text{if } -3 \leq x < 1 \\ x + 5 & \text{if } 1 \leq x \leq 5 \end{cases}$ <p>When $x = 2$ then $f(x) = x + 5$, so $f(2) = 2 + 5 = 7$. The domain of f is $[-3, 5]$.</p>
Correlation coefficient r	The values of r satisfy $-1 \leq r \leq 1$, where a line fits the data better if r is near -1 or 1 . A value near 0 indicates a poor fit.
Least-squares regression line	The line of least-squares fit for the points $(1, 3)$, $(2, 5)$, and $(3, 6)$ is $y = \frac{3}{2}x + \frac{5}{3}$ and $r \approx 0.98$. Try verifying this with a calculator.

2.1

Exercises

Functions as Models

- U.S. Vehicle Production** In 2000 there were 12.8 million vehicles produced in the United States, and in 2004 there were 12.0 million. The formula $V(t) = -0.2t + 12.8$ models these data exactly, where $t = 0$ corresponds to 2000, $t = 1$ to 2001, and so on.
 - Verify that $V(t)$ gives the exact values in millions for 2000 and 2004.
 - Use $V(t)$ to estimate the number of vehicles manufactured in 2002 and 2006. Do these estimates involve interpolation or extrapolation?
 - The actual value for 2002 was 12.3 million and for 2006 was 11.3 million. Discuss the accuracy of your results from part (b).
- U.S. Advertising Expenditures** In 2002 \$237 billion was spent on advertising in the United States, and in 2004 this amount was \$264 billion. The formula $A(t) = 13.5t + 237$ models these data exactly, where $t = 0$ corresponds to 2002, $t = 1$ to 2003, and so on.
 - Verify that $A(t)$ gives the exact values in billions of dollars for 2002 and 2004.
 - Use $A(t)$ to estimate the advertising expenditures in 2000 and 2003. Do these estimates involve interpolation or extrapolation?
 - The actual value for 2000 was \$244 billion and for 2003 was \$245 billion. Discuss the accuracy of your results from part (b).

Exercises 3–6: A function f is given. Determine whether f models the data exactly or approximately.

3. $f(x) = 5x - 2$

x	1	2	3	4
y	3	8	13	18

4. $f(x) = 1 - 0.2x$

x	5	10	15	20
y	0	-1	-2	-4

5. $f(x) = 3.7 - 1.5x$

x	-6	0	1
y	12.7	3.7	2.1

6. $f(x) = 13.3x - 6.1$

x	1	2	5
y	7.2	20.5	60.4

Exercises 7–10: Find the formula for a linear function f that models the data in the table exactly.

7.

x	-2	0	4
$f(x)$	4	3	1

8.

x	-6	0	3
$f(x)$	-5	-1	1

9.

x	1	2	3
$f(x)$	7	9	11

10.

x	15	30	45
$f(x)$	40	30	20

Exercises 11 and 12: Write a symbolic representation (formula) for a function f that computes the following.

11. (a) The number of pounds in x ounces
 (b) The number of dimes in x dollars
 (c) The monthly electric bill in dollars if x kilowatt-hours are used at 6 cents per kilowatt-hour and there is a fee of \$6.50
 (d) The cost of skiing x times with a \$500 season pass
12. (a) The distance traveled by a car moving at 50 miles per hour for x hours
 (b) The total number of hours in day x
 (c) The distance in miles between a runner and home after x hours if the runner starts 1 mile from home and jogs away from home at 6 miles per hour
 (d) A car's speed in feet per second after x seconds if its tires are 2 feet in diameter and rotating 14 times per second

Graphs of Linear Functions

Exercises 13–18: The graph of a linear function f is shown.

- (a) Identify the slope, y -intercept, and x -intercept.
 (b) Write a formula for f .
 (c) Estimate the zero of f .
 (d) Is f increasing or decreasing on its domain?

13.

14.

15.

16.

17.

18.

Exercises 19–32: Graph the linear function by hand. Identify the slope and y -intercept.

19. $f(x) = 3x + 2$

20. $f(x) = -\frac{3}{2}x$

21. $f(x) = \frac{1}{2}x - 2$

22. $f(x) = 3 - x$

23. $g(x) = -2$

24. $g(x) = 20 - 10x$

25. $f(x) = 4 - \frac{1}{2}x$

26. $f(x) = 2x - 3$

27. $g(x) = \frac{1}{2}x$

28. $g(x) = 3$

29. $g(x) = 5 - 5x$

30. $g(x) = \frac{3}{4}x - 2$

31. $f(x) = 20x - 10$

32. $f(x) = -30x + 20$

Exercises 33–38: Write a formula for a linear function f whose graph satisfies the conditions.

33. Slope $-\frac{3}{4}$, y -intercept $\frac{1}{3}$
 34. Slope -122 , y -intercept 805
 35. Slope 15 , passing through the origin
 36. Slope 1.68 , passing through $(0, 1.23)$
 37. Slope 0.5 , passing through $(1, 4.5)$
 38. Slope -2 , passing through $(-1, 5)$

Exercises 39–44: **Average Rate of Change** Find the average rate of change of f from -2 to 2 . What is the average rate of change of f from x_1 to x_2 , where $x_1 \neq x_2$?

39. $f(x) = 10$ 40. $f(x) = -5$
 41. $f(x) = -\frac{1}{4}x$ 42. $f(x) = \frac{5}{3}x$
 43. $f(x) = 4 - 3x$ 44. $f(x) = 5x + 1$

Modeling with Linear Functions

Exercises 45–48: Match the situation with the graph (a–d) that models it best, where x -values represent time.

45. Height of the Empire State Building from 1990 to 2000
 46. Average cost of a new car from 1980 to 2000
 47. Distance between a runner in a race and the finish line
 48. Amount of money earned after x hours when working at an hourly rate of pay

Exercises 49–54: Write a formula for a linear function that models the situation. Choose both an appropriate name and an appropriate variable for the function. State what the input variable represents and the domain of the function. Assume that the domain is an interval of the real numbers.

49. **U.S. Homes with Internet** In 2006 about 68% of U.S. homes had Internet access. This percentage was expected to increase, on average, by 1.5 percentage points per year for the next 4 years. (Source: 2007 Digital Future Report.)
 50. **U.S. Cell Phones** In 2005 there were about 208 million U.S. cell phone subscribers. This number was expected to increase, on average, by 20 million per year for the next 3 years. (Source: CTIA Industry Survey.)
 51. **Velocity of a Falling Object** A stone is dropped from a water tower and its velocity increases at a rate of 32 feet per second. The stone hits the ground with a velocity of 96 feet per second.
 52. **Speed of a Car** A car is traveling at 30 miles per hour, and then it begins to slow down at a constant rate of 6 miles per hour every 4 seconds.
 53. **Population Density** In 1900 the average number of people per square mile in the United States was 21.5, and it increased, on average, by 5.81 people every 10 years until 2000. (Source: Bureau of the Census.)
 54. **Injury Rate** In 1992 the number of injury cases recorded in private industry per 100 full-time workers was 8.3, and it decreased, on average, by 0.32 injury every year until 2001. (Source: Bureau of Labor Statistics.)
 55. **Draining a Water Tank** A 300-gallon tank is initially full of water and is being drained at a rate of 10 gallons per minute.
 (a) Write a formula for a function W that gives the number of gallons of water in the tank after t minutes.
 (b) How much water is in the tank after 7 minutes?
 (c) Graph W and identify and interpret the intercepts.
 (d) Find the domain of W .
 56. **Filling a Tank** A 500-gallon tank initially contains 200 gallons of fuel oil. A pump is filling the tank at a rate of 6 gallons per minute.
 (a) Write a formula for a linear function f that models the number of gallons of fuel oil in the tank after x minutes.

- (b) Graph f . What is an appropriate domain for f ?
- (c) Identify the y -intercept and interpret it.
- (d) Does the x -intercept of the graph of f have any physical meaning in this problem? Explain.

57. **HIV Infections** In 2006 there were 40 million people worldwide who had been infected with HIV. At that time the infection rate was 4.3 million people per year. (Source: United Nations AIDS and World Health Organization.)

- (a) Write a formula for a linear function f that models the total number of people in millions who were infected with HIV x years after 2006.
- (b) Estimate the number of people who may have been infected by the year 2012.

58. **Birth Rate** In 1990 the number of births per 1000 people in the United States was 16.7 and decreasing at 0.21 birth per 1000 people each year. (Source: National Center for Health Statistics.)

- (a) Write a formula for a linear function f that models the birth rate x years after 1990.
- (b) Estimate the birth rate in 2003 and compare the estimate to the actual value of 14.

59. **Ice Deposits** A roof has a 0.5-inch layer of ice on it from a previous storm. Another ice storm begins to deposit ice at a rate of 0.25 inch per hour.

- (a) Find a formula for a linear function f that models the thickness of the ice on the roof x hours after the second ice storm started.
- (b) How thick is the ice after 2.5 hours?

60. **Rainfall** Suppose that during a storm rain is falling at a rate of 1 inch per hour. The water coming from a circular roof with a radius of 20 feet is running down a

downspout that can accommodate 400 gallons of water per hour. See the figure.

- (a) Determine the number of cubic inches of water falling on the roof in 1 hour.
- (b) One gallon equals about 231 cubic inches. Write a formula for a function g that computes the gallons of water landing on the roof in x hours.
- (c) How many gallons of water land on the roof during a 2.5-hour rain storm?
- (d) Will one downspout be sufficient to handle this type of rainfall? How many downspouts should there be?

Exercises 61 and 62: **Modeling Fuel Consumption** The table shows the distance y in miles traveled by a vehicle using x gallons of gasoline.

- (a) Calculate the slopes of the line segments that connect consecutive points.
- (b) Find a linear function that models the data.
- (c) Graph f and the data together. What does the slope indicate?
- (d) Evaluate $f(30)$ and interpret the result.

61.	x (gallons)	5	10	15	20
	y (miles)	84	169	255	338

62.	x (gallons)	5	10	15	20
	y (miles)	194	392	580	781

Piecewise-Defined Functions

63. **Speed Limits** The graph of $y = f(x)$ on the next page gives the speed limit y along a rural highway x miles from its starting point.

- (a) What are the maximum and minimum speed limits along this stretch of highway?
- (b) Estimate the miles of highway with a speed limit of 55 miles per hour.

- (c) Evaluate $f(4)$, $f(12)$, and $f(18)$.
- (d) At what x -values is the graph discontinuous? Interpret each discontinuity.

64. **ATM** The graph of $y = f(x)$ depicts the amount of money y in dollars in an automatic teller machine (ATM) after x minutes.
- (a) Determine the initial and final amounts of money in the ATM.
- (b) Evaluate $f(10)$ and $f(50)$. Is f continuous?
- (c) How many *withdrawals* occurred?
- (d) When did the largest withdrawal occur? How much was it?
- (e) How much was deposited into the machine?

65. **First-Class Mail** In March 2008, the retail flat rate in dollars for first-class mail weighing up to 5 ounces could be computed by the piecewise-constant function P , where x is the number of ounces.

$$P(x) = \begin{cases} 0.80 & \text{if } 0 < x \leq 1 \\ 0.97 & \text{if } 1 < x \leq 2 \\ 1.14 & \text{if } 2 < x \leq 3 \\ 1.31 & \text{if } 3 < x \leq 4 \\ 1.48 & \text{if } 4 < x \leq 5 \end{cases}$$

- (a) Evaluate $P(1.5)$ and $P(3)$. Interpret your results.
- (b) Sketch a graph of P . What is the domain of P ?
- (c) Where is P discontinuous on its domain?

66. **Swimming Pool Levels** The graph of $y = f(x)$ shows the amount of water y in thousands of gallons remaining in a swimming pool after x days.

- (a) Estimate the initial and final amounts of water in the pool.
- (b) When did the amount of water in the pool remain constant?
- (c) Approximate $f(2)$ and $f(4)$.
- (d) At what rate was water being drained from the pool when $1 \leq x \leq 3$?

Exercises 67 and 68: An individual is driving a car along a straight road. The graph shows the driver's distance from home after x hours.

- (a) Use the graph to evaluate $f(1.5)$ and $f(4)$.
- (b) Interpret the slope of each line segment.
- (c) Describe the motion of the car.
- (d) Identify where f is increasing, decreasing, or constant.

67.

68.

Exercises 69–74: Complete the following for $f(x)$.

- Determine the domain of f .
- Evaluate $f(-2)$, $f(0)$, and $f(3)$.
- Graph f .
- Is f continuous on its domain?

$$69. f(x) = \begin{cases} 2 & \text{if } -5 \leq x \leq -1 \\ x + 3 & \text{if } -1 < x \leq 5 \end{cases}$$

$$70. f(x) = \begin{cases} 2x + 1 & \text{if } -3 \leq x < 0 \\ x - 1 & \text{if } 0 \leq x \leq 3 \end{cases}$$

$$71. f(x) = \begin{cases} 3x & \text{if } -1 \leq x < 1 \\ x + 1 & \text{if } 1 \leq x \leq 2 \end{cases}$$

$$72. f(x) = \begin{cases} -2 & \text{if } -6 \leq x < -2 \\ 0 & \text{if } -2 \leq x < 0 \\ 3x & \text{if } 0 \leq x \leq 4 \end{cases}$$

$$73. f(x) = \begin{cases} x & \text{if } -3 \leq x \leq -1 \\ 1 & \text{if } -1 < x < 1 \\ 2 - x & \text{if } 1 \leq x \leq 3 \end{cases}$$

$$74. f(x) = \begin{cases} 3 & \text{if } -4 \leq x \leq -1 \\ x - 2 & \text{if } -1 < x \leq 2 \\ 0.5x & \text{if } 2 < x \leq 4 \end{cases}$$

Exercises 75 and 76: Graph f .

$$75. f(x) = \begin{cases} -\frac{1}{2}x + 1 & \text{if } -4 \leq x \leq -2 \\ 1 - 2x & \text{if } -2 < x \leq 1 \\ \frac{2}{3}x + \frac{4}{3} & \text{if } 1 < x \leq 4 \end{cases}$$

$$76. f(x) = \begin{cases} \frac{3}{2} - \frac{1}{2}x & \text{if } -3 \leq x < -1 \\ -2x & \text{if } -1 \leq x \leq 2 \\ \frac{1}{2}x - 5 & \text{if } 2 < x \leq 3 \end{cases}$$

77. Use $f(x)$ to complete the following:

$$f(x) = \begin{cases} 3x - 1 & \text{if } -5 \leq x < 1 \\ 4 & \text{if } 1 \leq x \leq 3 \\ 6 - x & \text{if } 3 < x \leq 5 \end{cases}$$

- Evaluate f at $x = -3, 1, 2$, and 5 .
- On what interval is f constant?
- Sketch a graph of f . Is f continuous on its domain?

78. Use $g(x)$ to complete the following.

$$g(x) = \begin{cases} -2x - 6 & \text{if } -8 \leq x \leq -2 \\ x & \text{if } -2 < x < 2 \\ 0.5x + 1 & \text{if } 2 \leq x \leq 8 \end{cases}$$

- Evaluate g at $x = -8, -2, 2$, and 8 .
- For what x -values is g increasing?
- Sketch a graph of g . Is g continuous on its domain?

Greatest Integer Function

Exercises 79–82: Complete the following.

 (a) Use dot mode to graph the function f in the standard viewing rectangle.

(b) Evaluate $f(-3.1)$ and $f(1.7)$.

$$79. f(x) = \lfloor 2x - 1 \rfloor \qquad 80. f(x) = \lfloor x + 1 \rfloor$$

$$81. f(x) = 2\lfloor x \rfloor + 1 \qquad 82. f(x) = \lfloor -x \rfloor$$

83. Lumber Costs The lumber used to frame walls of houses is frequently sold in multiples of 2 feet. If the length of a board is not exactly a multiple of 2 feet, there is often no charge for the additional length. For example, if a board measures at least 8 feet but less than 10 feet, then the consumer is charged for only 8 feet.

- Suppose that the cost of lumber is \$0.80 for every 2 feet. Find a formula for a function f that computes the cost of a board x feet long for $6 \leq x \leq 18$.
- Graph f .
- Determine the costs of boards with lengths of 8.5 feet and 15.2 feet.

84. **Cost of Carpet** Each foot of carpet purchased from a 12-foot-wide roll costs \$36. If a fraction of a foot is purchased, a customer does not pay for the extra amount. For example, if a customer wants 14 feet of carpet and the salesperson cuts off 14 feet 4 inches, the customer does not pay for the extra 4 inches.

- (a) How much does 9 feet 8 inches of carpet from this roll cost?
- (b) Using the greatest integer function, write a formula for the price P of x feet of carpet.

Linear Regression

Exercises 85 and 86: Find the line of least-squares fit for the given data points. What is the correlation coefficient? Plot the data and graph the line.

85. $(-2, 2), (1, 0), (3, -2)$ 86. $(-1, -1), (1, 4), (2, 6)$

Exercises 87–90: Complete the following.

- (a) Conjecture whether the correlation coefficient r for the data will be positive, negative, or zero.
- (b) Use a calculator to find the equation of the least-squares regression line and the value of r .
- (c) Use the regression line to predict y when $x = 2.4$.

87.	x	-1	0	1	2	3
	y	-5.7	-2.6	1.1	3.9	7.3

88.	x	-4	-2	0	2	4
	y	1.2	2.8	5.3	6.7	9.1

89.	x	1	3	5	7	10
	y	5.8	-2.4	-10.7	-17.8	-29.3

90.	x	-4	-3	-1	3	5
	y	37.2	33.7	27.5	16.4	9.8

91. **Distant Galaxies** In the late 1920s the famous observational astronomer Edwin P. Hubble (1889–1953) determined both the distance to several galaxies and the velocity at which they were receding from Earth. Four galaxies with their distances in light-years and velocities in miles per second are listed in the table at the top of the next column.

Galaxy	Distance	Velocity
Virgo	50	990
Ursa Minor	650	9,300
Corona Borealis	950	15,000
Bootes	1700	25,000

Source: A. Sharov and I. Novikov, *Edwin Hubble: The Discoverer of the Big Bang Universe*.

- (a) Let x be distance and y be velocity. Plot the data points in $[-100, 1800, 100]$ by $[-1000, 28000, 1000]$.
- (b) Find the least-squares regression line.
- (c) If the galaxy Hydra is receding at a speed of 37,000 miles per second, estimate its distance.

92. **Cell Phones** One of the early problems with cell phones was the delay involved with placing a call when the system was busy. One study analyzed this delay. The table shows that as the number of calls increased by P percent, the average delay time D to put through a call also increased.

P (%)	0	20	40	60	80	100
D (minutes)	1	1.6	2.4	3.2	3.8	4.4

Source: A Mehrotra, *Cellular Radio: Analog and Digital Systems*.

- (a) Let P correspond to x -values and D to y -values. Find the least-squares regression line that models these data. Plot the data and the regression line.
- (b) Estimate the delay for a 50% increase in the number of calls.

93. **Passenger Travel** The table shows the number of miles (in trillions) traveled by passengers of all types for various years, where $x = 0$ corresponds to 1970, $x = 10$ to 1980, and so on.

Year (1970 \leftrightarrow 0)	0	10	20	30	35
Miles (trillions)	2.2	2.8	3.7	4.7	5.1

Source: Department of Transportation.

- (a) Make a scatterplot of the data. Predict whether the correlation coefficient will be positive or negative.

- (b) Use regression to find a formula $f(x) = ax + b$ so that f models the data.
- (c) Graph f and the data. Interpret the slope.
- (d) Predict the number of passenger miles in 2010.
94. **High School Enrollment** The table lists the number of students (in millions) attending U.S. public school (grades 9–12) for selected years, where $x = 0$ corresponds to 2000, $x = 1$ to 2001, and so on.

x (year)	0	3	5	7
y (students)	13.5	14.3	14.8	15.1

Source: National Center for Education Statistics.

- (a) Use regression to find a formula $f(x) = ax + b$ so that f models the data.
- (b) Graph f and the data. Interpret the slope.
- (c) Estimate enrollment in 2002 and compare the estimate to the actual value of 14.1 million.

Writing about Mathematics

95. How can you recognize a symbolic representation (formula) of a linear function? How can you recognize a graph or table of values of a linear function?
96. A student graphs $f(x) = x^2 - x$ in the viewing rectangle $[2, 2.1, 0.01]$ by $[1.9, 2.3, 0.1]$. Using the graph, the student decides that f is a linear function. How could you convince the student otherwise?
97. Explain how average rate of change relates to a linear function.
98. Find a real data set on the Internet that can be modeled by a linear function. Find the linear modeling function. Is your model exact or approximate? Explain.

99. Explain how you determine whether a linear function is increasing, decreasing, or constant. Give an example of each.
100. Explain what a piecewise-defined function is and why it is used. Sketch a graph of a continuous piecewise-linear function f that increases, decreases, and is constant. Let the domain of f be $-4 \leq x \leq 4$.

EXTENDED AND DISCOVERY EXERCISES

1. **Height and Shoe Size** In this exercise you will determine if there is a relationship between height and shoe size.
- (a) Have classmates write their sex, shoe size, and height in inches on a slip of paper. When you have enough information, complete the following table—one for adult males and one for adult females.

Height (inches)				
Shoe size				

- (b) Make a scatterplot of each table, with height on the x -axis and shoe size on the y -axis. Is there any relationship between height and shoe size? Explain.
- (c) Try to find a linear function that models each data set.

 **Exercises 2 and 3: Linear Approximation** Graph the function f in the standard viewing rectangle.

- (a) Choose any curved portion of the graph of f and repeatedly zoom in. Describe how the graph appears. Repeat this process on different portions of the graph.
- (b) Under what circumstances could a linear function be used to accurately model a nonlinear graph?

2. $f(x) = 4x - x^3$

3. $f(x) = x^4 - 5x^2$

2.2 Equations of Lines

- Write the point-slope and slope-intercept forms
- Find the intercepts of a line
- Write equations for horizontal, vertical, parallel, and perpendicular lines
- Model data with lines and linear functions (optional)
- Use direct variation to solve problems

Figure 2.19

Introduction

Apple Corporation sold approximately 4.4 million iPods in fiscal 2004 and 46.4 million iPods in fiscal 2006, making the iPod the fastest selling music player in history. (Source: Apple Corporation.) Can we use this information to make estimates about future sales? Mathematics is often used to analyze data and to make predictions. One of the simplest ways to make estimates is to use linear functions and lines. This section discusses how to use data points to find equations of lines. See Example 4.

Forms for Equations of Lines

Point-Slope Form Suppose that a nonvertical line with slope m passes through the point (x_1, y_1) . If (x, y) is any point on this nonvertical line with $x \neq x_1$, then the change in y is $\Delta y = y - y_1$, the change in x is $\Delta x = x - x_1$, and the slope equals $m = \frac{\Delta y}{\Delta x} = \frac{y - y_1}{x - x_1}$, as illustrated in Figure 2.19.

With this slope formula, the equation of the line can be found.

$$m = \frac{y - y_1}{x - x_1} \quad \text{Slope formula}$$

$$y - y_1 = m(x - x_1) \quad \text{Cross multiply.}$$

$$y = m(x - x_1) + y_1 \quad \text{Add } y_1 \text{ to each side.}$$

The equation $y - y_1 = m(x - x_1)$ is traditionally called the *point-slope form* of the equation of a line. Since we think of y as being a function of x , written $y = f(x)$, the equivalent form $y = m(x - x_1) + y_1$ will also be referred to as the point-slope form. The point-slope form is not unique, as any point on the line can be used for (x_1, y_1) . However, these point-slope forms are *equivalent*—their graphs are identical.

Point-Slope Form

The line with slope m passing through the point (x_1, y_1) has an equation

$$y = m(x - x_1) + y_1, \quad \text{or} \quad y - y_1 = m(x - x_1),$$

the **point-slope form** of the equation of a line.

In the next example we find the equation of a line given two points.

EXAMPLE 1 Determining a point-slope form

Find an equation of the line passing through the points $(-2, -3)$ and $(1, 3)$. Plot the points and graph the line by hand.

SOLUTION Begin by finding the slope of the line.

$$m = \frac{3 - (-3)}{1 - (-2)} = \frac{6}{3} = 2$$

Figure 2.20

Algebra Review

To review the distributive property, see Chapter R (page R-15).

Figure 2.21

Substituting $(x_1, y_1) = (1, 3)$ and $m = 2$ into the point-slope form results in

$$y = 2(x - 1) + 3. \quad y = m(x - x_1) + y_1$$

If we use the point $(-2, -3)$, the point-slope form is

$$y = 2(x + 2) - 3. \quad \text{Note that } (x - (-2)) = (x + 2).$$

This line and the two points are shown in Figure 2.20.

Now Try Exercise 1

Slope-Intercept Form The two point-slope forms found in Example 1 are equivalent.

$y = 2(x - 1) + 3$	$y = 2(x + 2) - 3$	Point-slope form
$y = 2x - 2 + 3$	$y = 2x + 4 - 3$	Distributive property
$y = 2x + 1$	$y = 2x + 1$	Simplify.

Both point-slope forms simplify to the same equation.

The form $y = mx + b$ is called the *slope-intercept form*. Unlike the point-slope form, it is *unique*. The real number m represents the slope and the real number b represents the y -intercept, as illustrated in Figure 2.21.

Slope-Intercept Form

The line with slope m and y -intercept b is given by

$$y = mx + b,$$

the **slope-intercept form** of the equation of a line.

EXAMPLE 2 Finding equations of lines

Find the point-slope form for the line that satisfies the conditions. Then convert this equation into slope-intercept form.

- (a) Slope $-\frac{1}{2}$, passing through the point $(-3, -7)$
- (b) x -intercept -4 , y -intercept 2

SOLUTION

- (a) Let $m = -\frac{1}{2}$ and $(x_1, y_1) = (-3, -7)$ in the point-slope form.

$$y = m(x - x_1) + y_1 \quad \text{Point-slope form}$$

$$y = -\frac{1}{2}(x + 3) - 7 \quad \text{Substitute.}$$

The slope-intercept form can be found by simplifying.

$$y = -\frac{1}{2}(x + 3) - 7 \quad \text{Point-slope form}$$

$$y = -\frac{1}{2}x - \frac{3}{2} - 7 \quad \text{Distributive property}$$

$$y = -\frac{1}{2}x - \frac{17}{2} \quad \text{Slope-intercept form}$$

(b) The line passes through the points $(-4, 0)$ and $(0, 2)$. Its slope is

$$m = \frac{2 - 0}{0 - (-4)} = \frac{1}{2}.$$

Thus a point-slope form for the line is $y = \frac{1}{2}(x + 4) + 0$, where the point $(-4, 0)$ is used for (x_1, y_1) . The slope-intercept form is $y = \frac{1}{2}x + 2$. **Now Try Exercises 5 and 9** ◀

The next example demonstrates how to find the slope-intercept form of a line without first finding the point-slope form.

EXAMPLE 3 Finding slope-intercept form

Find the slope-intercept form of the line passing through the points $(-2, 1)$ and $(2, 3)$.

SOLUTION

Getting Started We need to determine m and b in the slope-intercept form, $y = mx + b$. First find the slope m . Then substitute *either* point into the equation and determine b . ▶

$$m = \frac{3 - 1}{2 - (-2)} = \frac{2}{4} = \frac{1}{2}$$

Thus $y = \frac{1}{2}x + b$. To find b , we substitute **(2, 3)** in this equation.

$$3 = \frac{1}{2}(2) + b \quad \text{Let } x = 2 \text{ and } y = 3.$$

$$3 = 1 + b \quad \text{Multiply.}$$

$$2 = b \quad \text{Determine } b.$$

Thus $y = \frac{1}{2}x + 2$.

Now Try Exercise 21 ◀

An Application In the next example we model the data about iPods discussed in the introduction to this section.

EXAMPLE 4 Estimating iPod sales

Apple Corporation sold approximately 4.4 million iPods in fiscal 2004 and 46.4 million iPods in fiscal 2006.

- Find the point-slope form of the line passing through $(2004, 4.4)$ and $(2006, 46.4)$. Interpret the slope of the line as a rate of change.
- Sketch a graph of the data and the line connecting these points.
- Estimate sales in 2005 and compare the estimate to the true value of 23 million. Did your estimate involve interpolation or extrapolation?
- Estimate sales in 2003 and 2008. Discuss the accuracy of your answers.

SOLUTION

Getting Started First find the slope m of the line connecting the data points, and then substitute this value for m and either of the two data points in the point-slope form. We can use this equation to estimate sales by substituting the required year for x in the equation. ▶

Figure 2.22 iPod Sales

- (a) The slope of the line passing through $(2004, 4.4)$ and $(2006, 46.4)$ is

$$m = \frac{46.4 - 4.4}{2006 - 2004} = 21.$$

Thus sales of iPods increased, on average, by 21 million iPods per year from 2004 to 2006. If we substitute 21 for m and $(2004, 4.4)$ for (x_1, y_1) , the point-slope form is

$$y = 21(x - 2004) + 4.4.$$

- (b) The requested line passing through the data points is shown in Figure 2.22.
 (c) If $x = 2005$, then $y = 21(2005 - 2004) + 4.4 \approx 25.4$ million. This value is slightly high; its calculation involves interpolation because 2005 lies between 2004 and 2006.
 (d) We can use the equation to estimate 2003 and 2008 sales as follows.

$$y = 21(2003 - 2004) + 4.4 = -16.6 \text{ million} \quad \text{Let } x = 2003.$$

$$y = 21(2008 - 2004) + 4.4 = 88.4 \text{ million} \quad \text{Let } x = 2008.$$

Both estimates involve extrapolation, because 2003 and 2008 are not between 2004 and 2006. The 2003 value is clearly incorrect because sales cannot be negative. The 2008 value appears to be more reasonable.

Now Try Exercise 81 ◀

Finding Intercepts

The point-slope form and the slope-intercept form are not the only forms for the equation of a line. An equation of a line is in **standard form** when it is written as

$$ax + by = c,$$

where a , b , and c are constants. By using standard form, we can write the equation of any line, including vertical lines (which are discussed later in this section). Examples of equations of lines in standard form include

$$2x - 3y = -6, \quad y = \frac{1}{4}, \quad x = -3, \quad \text{and} \quad -3x + y = \frac{1}{2}.$$

($a = 0$) ($b = 0$)

Standard form is a convenient form for finding the x - and y -intercepts of a line. Once the intercepts have been found, we can graph the line. For example, to find the x -intercept for the line determined by $3x + 4y = 12$, we let $y = 0$ and solve for x to obtain

$$3x + 4(0) = 12, \quad \text{or} \quad x = 4.$$

The x -intercept is 4. To find the y -intercept, we let $x = 0$ and solve for y to obtain

$$3(0) + 4y = 12, \quad \text{or} \quad y = 3.$$

The y -intercept is 3. Thus the graph of $3x + 4y = 12$ passes through the points $(4, 0)$ and $(0, 3)$. Knowing these two points allows us to graph the line. This technique can be used to find intercepts on the graph of any equation, not just lines written in standard form.

Finding Intercepts

To find any x -intercepts, let $y = 0$ in the equation and solve for x .

To find any y -intercepts, let $x = 0$ in the equation and solve for y .

NOTE To solve $ax = b$, divide each side by a to obtain $x = \frac{b}{a}$. Thus $5x = 20$ implies that $x = \frac{20}{5} = 4$. Linear equations are solved in general in the next section.

EXAMPLES Finding intercepts

Locate the x - and y -intercepts for the line whose equation is $4x + 3y = 6$. Use the intercepts to graph the equation.

SOLUTION To locate the x -intercept, let $y = 0$ in the equation.

$$4x + 3(0) = 6 \quad \text{Let } y = 0.$$

$$x = 1.5 \quad \text{Divide by 4}$$

The x -intercept is **1.5**. Similarly, to find the y -intercept, substitute $x = 0$ into the equation.

$$4(0) + 3y = 6 \quad \text{Let } x = 0$$

$$y = 2 \quad \text{Divide by 3}$$

The y -intercept is **2**. Therefore the line passes through the points **(1.5, 0)** and **(0, 2)**, as shown in Figure 2.23.

Now Try Exercise 57 ◀

Figure 2.23

Horizontal, Vertical, Parallel, and Perpendicular Lines

Horizontal and Vertical Lines The graph of a constant function f , defined by the formula $f(x) = b$, is a horizontal line having slope 0 and y -intercept b .

A vertical line cannot be represented by a function because distinct points on a vertical line have the same x -coordinate. In fact, this is the distinguishing feature of points on a vertical line—they all have the same x -coordinate. The vertical line shown in Figure 2.24 is $x = 3$. The equation of a vertical line with x -intercept k is given by $x = k$, as shown in Figure 2.25. Horizontal lines have slope 0, and vertical lines have an undefined slope.

CLASS DISCUSSION

Why do you think that a vertical line sometimes is said to have “infinite slope”? What are some problems with taking this phrase too literally?

Figure 2.24

Figure 2.25

Equations of Horizontal and Vertical Lines

An equation of the horizontal line with y -intercept b is $y = b$. An equation of the vertical line with x -intercept k is $x = k$.

EXAMPLE 6

Finding equations of horizontal and vertical lines

Find equations of vertical and horizontal lines passing through the point $(8, 5)$.

SOLUTION The x -coordinate of the point $(8, 5)$ is 8. The vertical line $x = 8$ passes through every point in the xy -plane with an x -coordinate of 8, including the point $(8, 5)$. Similarly, the horizontal line $y = 5$ passes through every point with a y -coordinate of 5, including $(8, 5)$.

Now Try Exercises 49 and 51 ◀

Parallel Lines Slope is an important concept when determining whether two lines are parallel or perpendicular. Two nonvertical parallel lines have equal slopes.

Parallel Lines

Two lines with slopes m_1 and m_2 , neither of which is vertical, are parallel if and only if their slopes are equal; that is, $m_1 = m_2$.

NOTE The phrase “if and only if” is used when two statements are mathematically equivalent. If two nonvertical lines are parallel, then it is true that $m_1 = m_2$. Conversely, if two nonvertical lines have equal slopes, then they are parallel. Either condition implies the other.

EXAMPLE 7 Finding parallel lines

Find the slope-intercept form of a line parallel to $y = -2x + 5$, passing through $(4, 3)$.

SOLUTION The line $y = -2x + 5$ has slope -2 , so any parallel line also has slope $m = -2$. The line passing through $(4, 3)$ with slope -2 is determined as follows.

$$y = -2(x - 4) + 3 \quad \text{Point-slope form}$$

$$y = -2x + 8 + 3 \quad \text{Distributive property}$$

$$y = -2x + 11 \quad \text{Slope-intercept form}$$

Now Try Exercise 35 ◀

Perpendicular Lines Two lines with nonzero slopes are perpendicular if and only if the product of their slopes is equal to -1 .

Perpendicular Lines

Two lines with nonzero slopes m_1 and m_2 are perpendicular if and only if their slopes have product -1 ; that is, $m_1 m_2 = -1$.

For perpendicular lines, m_1 and m_2 are *negative reciprocals*. That is, $m_1 = -\frac{1}{m_2}$ and $m_2 = -\frac{1}{m_1}$. Table 2.5 shows examples of values for m_1 and m_2 that result in perpendicular lines because $m_1 m_2 = -1$.

Table 2.5 Slopes of Perpendicular Lines

m_1	$\frac{1}{2}$	$\frac{6}{5}$	5	-1	$-\frac{2}{3}$
m_2	-2	$-\frac{5}{6}$	$-\frac{1}{5}$	1	$\frac{3}{2}$
$m_1 m_2$	-1	-1	-1	-1	-1

EXAMPLE 8 Finding perpendicular lines

Find the slope-intercept form of the line perpendicular to $y = -\frac{2}{3}x + 2$, passing through the point $(-2, 1)$. Graph the lines.

SOLUTION The line $y = -\frac{2}{3}x + 2$ has slope $-\frac{2}{3}$. The negative reciprocal of $m_1 = -\frac{2}{3}$ is $m_2 = \frac{3}{2}$. The slope-intercept form of a line having slope $\frac{3}{2}$ and passing through $(-2, 1)$ can be found as follows.

$$y = m(x - x_1) + y_1 \quad \text{Point-slope form}$$

$$y = \frac{3}{2}(x + 2) + 1 \quad \text{Let } m = \frac{3}{2}, x_1 = -2, \text{ and } y_1 = 1.$$

$$y = \frac{3}{2}x + 3 + 1 \quad \text{Distributive property}$$

$$y = \frac{3}{2}x + 4 \quad \text{Slope-intercept form}$$

Figure 2.26 Perpendicular Lines

Figure 2.26 shows graphs of these perpendicular lines.

Now Try Exercise 41

NOTE If a graphing calculator is used to graph these lines, a square viewing rectangle must be used for the lines to appear perpendicular.

EXAMPLE 9 Determining a rectangle

In Figure 2.27 a rectangle is outlined by four lines denoted y_1 , y_2 , y_3 , and y_4 . Find the equation of each line.

SOLUTION

Line y_1 : This line passes through the points $(0, 0)$ and $(5, 3)$, so $m = \frac{3}{5}$ and the y -intercept is 0. Its equation is $y_1 = \frac{3}{5}x$.

Line y_2 : This line passes through the point $(0, 0)$ and is perpendicular to y_1 , so its slope is given by $m = -\frac{5}{3}$ and the y -intercept is 0. Its equation is $y_2 = -\frac{5}{3}x$.

Line y_3 : This line passes through the point $(5, 3)$ and is parallel to y_2 , so its slope is given by $m = -\frac{5}{3}$. In a point-slope form, its equation is $y_3 = -\frac{5}{3}(x - 5) + 3$, which is equivalent to $y_3 = -\frac{5}{3}x + \frac{34}{3}$.

Line y_4 : This line passes through the point $(0, 5)$ and is parallel to y_1 , so its slope is given by $m = \frac{3}{5}$. Its equation is $y_4 = \frac{3}{5}x + 5$.

Now Try Exercise 97

Figure 2.27

Calculator Help

To set a square viewing rectangle, see Appendix A (page AP-6).

CLASS DISCUSSION

Check the results from Example 9 by graphing the four equations in the same viewing rectangle. How does your graph compare with Figure 2.27? Why is it important to use a square viewing rectangle?

Modeling Data (Optional)

Point-slope form can sometimes be useful when modeling real data. In the next example we model the rise in the cost of tuition and fees at private colleges and universities.

EXAMPLE 10 Modeling data

Table 2.6 lists the average tuition and fees at private colleges for selected years.

Table 2.6 Tuition and Fees at Private Colleges

Year	1980	1985	1990	1995	2000	2005
Cost	\$3617	\$6121	\$9340	\$12,432	\$16,233	\$21,235

Source: The College Board.

Calculator Help

To make a scatterplot, see Appendix A (page AP-3). To plot data and graph an equation, see Appendix A (page AP-7).

- Make a scatterplot of the data.
- Find a linear function, given by $f(x) = m(x - x_1) + y_1$, that models the data. Interpret the slope m .
- Use f to estimate tuition and fees in 1998. Compare the estimate to the actual value of \$14,709. Did your answer involve interpolation or extrapolation?

SOLUTION

- See Figure 2.28.
- The data table contains several points that could be used for (x_1, y_1) . For example, we could choose the first data point, (1980, 3617), and then write

$$f(x) = m(x - 1980) + 3617.$$

To estimate a slope m we could choose two points that appear to lie on a line that models the data. For example, if we choose the first data point, (1980, 3617), and the fifth data point, (2000, 16233), then the slope m is

$$m = \frac{16,233 - 3617}{2000 - 1980} = 630.8.$$

This slope indicates that tuition and fees have risen, on average, \$630.80 per year.

Figure 2.29 shows the graphs of $f(x) = 630.8(x - 1980) + 3617$ and the data. It is important to realize that *answers may vary* when modeling real data because if you choose different points, the resulting equation for $f(x)$ will be different. Also, you may choose to adjust the slope or use linear regression to obtain a better fit to the data.

- To estimate the tuition and fees in 1998, evaluate $f(1998)$.

$$f(1998) = 630.8(1998 - 1980) + 3617 = \$14,971.40$$

This value differs from the actual value by less than \$300 and involves interpolation.

Now Try Exercise 85 

[1978, 2007, 5] by [0, 25000, 5000]

**Figure 2.28**

[1978, 2007, 5] by [0, 25000, 5000]

**Figure 2.29****MAKING CONNECTIONS**

Modeling and Forms of Equations In Example 10 we modeled college tuition and fees by using the formula

$$f(x) = 630.8(x - 1980) + 3617.$$

This point-slope form readily reveals that tuition and fees cost \$3617 in 1980 and have risen, on average, \$630.80 per year. In slope-intercept form, this formula becomes

$$f(x) = 630.8x - 1,245,367.$$

Although the slope is apparent in slope-intercept form, it is less obvious that the actual value of tuition in 1980 was \$3617. Which form is more convenient often depends on the problem being solved.

Direct Variation

When a change in one quantity causes a proportional change in another quantity, the two quantities are said to *vary directly* or to *be directly proportional*. For example, if we work for \$8 per hour, our pay is proportional to the number of hours that we work. Doubling the hours doubles the pay, tripling the hours triples the pay, and so on.

Direct Variation

Let x and y denote two quantities. Then y is **directly proportional** to x , or y **varies directly** with x , if there exists a nonzero number k such that

$$y = kx.$$

The number k is called the **constant of proportionality** or the **constant of variation**.

If a person earns \$57.75 working for 7 hours, the constant of proportionality k is the hourly pay rate. If y represents the pay in dollars and x the hours worked, then k is found by substituting values for x and y into the equation $y = kx$ and solving for k . That is,

$$57.75 = k(7), \text{ or } k = \frac{57.75}{7} = 8.25,$$

so the hourly pay rate is \$8.25 and, in general, $y = 8.25x$.

Figure 2.30 A Spring Being Stretched

An Application Hooke's law states that the distance that an elastic spring stretches beyond its natural length is *directly proportional* to the amount of weight hung on the spring, as illustrated in Figure 2.30. This law is valid whether the spring is stretched or compressed. The constant of proportionality is called the **spring constant**. Thus if a weight or force F is applied and the spring stretches a distance x beyond its natural length, then the equation $F = kx$ models this situation, where k is the spring constant.

EXAMPLE 11 Working with Hooke's Law

A 12-pound weight is hung on a spring, and it stretches 2 inches.

- Find the spring constant.
- Determine how far the spring will stretch when a 19-pound weight is hung on it.

SOLUTION

- Let $F = kx$, given that $F = 12$ pounds and $x = 2$ inches. Thus

$$12 = k(2), \text{ or } k = 6,$$

and the spring constant equals 6.

- Thus $F = 19$ and $F = 6x$ implies that $19 = 6x$, or $x = \frac{19}{6} \approx 3.17$ inches.

Now Try Exercise 113 ◀

The following four-step method can often be used to solve variation problems.

Solving a Variation Problem

When solving a variation problem, the following steps can be used.

- STEP 1:** Write the general equation for the type of variation problem that you are solving.
- STEP 2:** Substitute given values in this equation so the constant of variation k is the only unknown value in the equation. Solve for k .
- STEP 3:** Substitute the value of k in the general equation in Step 1.
- STEP 4:** Use this equation to find the requested quantity.

EXAMPLE 12 Solving a direct variation problem

Let T vary directly with x , and suppose that $T = 33$ when $x = 5$. Find T when $x = 31$.

SOLUTION

STEP 1: The equation for direct variation is $T = kx$.

STEP 2: Substitute 33 for T and 5 for x . Then solve for k .

$$T = kx \quad \text{Direct variation equation}$$

$$33 = k(5) \quad \text{Let } T = 33 \text{ and } x = 5.$$

$$\frac{33}{5} = k \quad \text{Divide each side by 5.}$$

STEP 3: Thus $T = \frac{33}{5}x$, or $T = 6.6x$.

STEP 4: When $x = 31$, we have $T = 6.6(31) = 204.6$.

Now Try Exercise 101 ◀

Suppose that for each point (x, y) in a data set the ratios $\frac{y}{x}$ are all equal to some constant k . That is, $\frac{y}{x} = k$ for each data point. Then $y = kx$, and so y varies directly with x and the constant of variation is k . In addition, the data points (x, y) all lie on the line $y = kx$, which has slope k and passes through the origin. These concepts are used in the next example.

EXAMPLE 13 Modeling memory requirements

Table 2.7 lists the megabytes (MB) x needed to record y seconds of music.

Table 2.7 Recording Digital Music

x (MB)	0.23	0.49	1.16	1.27
y (sec)	10.7	22.8	55.2	60.2

Source: Gateway 2000 System CD.

- (a) Compute the ratios $\frac{y}{x}$ for the four data points. Does y vary directly with x ? If it does, what is the constant of variation k ?
- (b) Estimate the seconds of music that can be stored on 5 megabytes.
- (c) Graph the data in Table 2.7 and the line $y = kx$.

SOLUTION

(a) The four ratios $\frac{y}{x}$ from Table 2.7 are

$$\frac{10.7}{0.23} \approx 46.5, \quad \frac{22.8}{0.49} \approx 46.5, \quad \frac{55.2}{1.16} \approx 47.6, \quad \text{and} \quad \frac{60.2}{1.27} \approx 47.4.$$

[0, 1.5, 0.5] by [0, 70, 10]

Figure 2.31

Because the ratios are nearly equal and these are real data, it is reasonable to say that y is directly proportional to x . The constant of proportionality is about 47, the average of the four ratios. This means that $y = 47x$ and we can store about 47 seconds of music per megabyte.

- (b) Let $x = 5$ in the equation $y = 47x$, to obtain $y = 47(5) = 235$ seconds.
 (c) Graphs of the data and the line $y = 47x$ are shown in Figure 2.31.

Now Try Exercise 115 ◀

2.2 Putting It All Together

The following table summarizes some important topics.

Concept	Comments	Examples
Point-slope form $y = m(x - x_1) + y_1$ or $y - y_1 = m(x - x_1)$	Used to find the equation of a line, given two points or one point and the slope	Given two points (5, 1) and (4, 3), first compute $m = \frac{3-1}{4-5} = -2$. An equation of this line is $y = -2(x - 5) + 1$.
Slope-intercept form $y = mx + b$	A unique equation for a line, determined by the slope m and the y -intercept b	An equation of the line with slope 5 and y -intercept -4 is $y = 5x - 4$.
Direct variation	The variable y is directly proportional to x or varies directly with x if $y = kx$ for some nonzero constant k . Constant k is the constant of proportionality or the constant of variation.	If the sales tax rate is 7%, the sales tax y on a purchase of x dollars is calculated by $y = 0.07x$, where $k = 0.07$. The sales tax on a purchase of \$125 is $y = 0.07(125) = \$8.75$.

The following table summarizes the important concepts concerning special types of lines.

Concept	Equation(s)	Examples
Horizontal line	$y = b$, where b is a constant	A horizontal line with y -intercept 7 has the equation $y = 7$.
Vertical line	$x = k$, where k is a constant	A vertical line with x -intercept -8 has the equation $x = -8$.
Parallel lines	$y = m_1x + b_1$ and $y = m_2x + b_2$, where $m_1 = m_2$	The lines given by $y = -3x - 1$ and $y = -3x + 5$ are parallel because they both have slope -3 .
Perpendicular lines	$y = m_1x + b_1$ and $y = m_2x + b_2$, where $m_1m_2 = -1$	The lines $y = 2x - 5$ and $y = -\frac{1}{2}x + 2$ are perpendicular because $m_1m_2 = 2\left(-\frac{1}{2}\right) = -1$.

2.2 Exercises

Equations of Lines

Exercises 1–4: Find the point-slope form of the line passing through the given points. Use the first point as (x_1, y_1) . Plot the points and graph the line by hand.

1. $(1, 2), (3, -2)$
2. $(-2, 3), (1, 0)$
3. $(-3, -1), (1, 2)$
4. $(-1, 2), (-2, -3)$

Exercises 5–10: Find a point-slope form of the line satisfying the conditions. Use the first point given for (x_1, y_1) . Then convert the equation to slope-intercept form.

5. Slope -2.4 , passing through $(4, 5)$
6. Slope 1.7 , passing through $(-8, 10)$
7. Passing through $(1, -2)$ and $(-9, 3)$
8. Passing through $(-6, 10)$ and $(5, -12)$
9. x -intercept 4 , y -intercept -3
10. x -intercept -2 , y -intercept 5

Exercises 11–14: Find the slope-intercept form for the line in the figure.

11.

12.

13.

14.

Exercises 15–20: Concepts Match the equation to its graph (a–f) shown in the next column.

15. $y = m(x - x_1) + y_1, m > 0$

16. $y = m(x - x_1) + y_1, m < 0$

17. $y = mx, m > 0$

18. $y = mx + b, m < 0$ and $b > 0$

19. $x = k, k > 0$

20. $y = b, b < 0$

a.

b.

c.

d.

e.

f.

Exercises 21–48: Find the slope-intercept form for the line satisfying the conditions.

21. Passing through $(-1, -4)$ and $(1, 2)$

22. Passing through $(-1, 6)$ and $(2, -3)$

23. Passing through $(4, 5)$ and $(1, -3)$

24. Passing through $(8, -2)$ and $(-2, 3)$

25. y -intercept 5 , slope -7.8

26. y -intercept -155 , slope 5.6

27. y -intercept 45 , x -intercept 90

28. x -intercept -6 , y -intercept -8
29. Slope -3 , passing through $(0, 5)$
30. Slope $\frac{1}{3}$, passing through $(\frac{1}{2}, -2)$
31. Passing through $(0, -6)$ and $(4, 0)$
32. Passing through $(\frac{3}{4}, -\frac{1}{4})$ and $(\frac{5}{4}, \frac{7}{4})$
33. Passing through $(\frac{1}{2}, \frac{3}{4})$ and $(\frac{1}{5}, \frac{2}{3})$
34. Passing through $(-\frac{7}{3}, \frac{5}{3})$ and $(\frac{5}{6}, -\frac{7}{6})$
35. Parallel to $y = 4x + 16$, passing through $(-4, -7)$
36. Parallel to the line $y = -\frac{3}{4}(x - 100) - 99$, passing through $(1, 3)$
37. Perpendicular to the line $y = -\frac{2}{3}(x - 1980) + 5$, passing through $(1980, 10)$
38. Perpendicular to $y = 6x - 10$, passing through $(15, -7)$
39. Parallel to $y = \frac{2}{3}x + 3$, passing through $(0, -2.1)$
40. Parallel to $y = -4x - \frac{1}{4}$, passing through $(2, -5)$
41. Perpendicular to $y = -2x$, passing through $(-2, 5)$
42. Perpendicular to $y = -\frac{6}{7}x + \frac{3}{7}$, passing through $(3, 8)$
43. Perpendicular to $x + y = 4$, passing through $(15, -5)$
44. Parallel to $2x - 3y = -6$, passing through $(4, -9)$
45. Passing through $(5, 7)$ and parallel to the line passing through $(1, 3)$ and $(-3, 1)$
46. Passing through $(1990, 4)$ and parallel to the line passing through $(1980, 3)$ and $(2000, 8)$
47. Passing through $(-2, 4)$ and perpendicular to the line passing through $(-5, \frac{1}{2})$ and $(-3, \frac{2}{3})$
48. Passing through $(\frac{3}{4}, \frac{1}{4})$ and perpendicular to the line passing through $(-3, -5)$ and $(-4, 0)$
53. Perpendicular to $y = 15$, passing through $(4, -9)$
54. Perpendicular to $x = 15$, passing through $(1.6, -9.5)$
55. Parallel to $x = 4.5$, passing through $(19, 5.5)$
56. Parallel to $y = -2.5$, passing through $(1985, 67)$

Finding Intercepts

Exercises 57–68: Determine the x - and y -intercepts on the graph of the equation. Graph the equation.

57. $4x - 5y = 20$ 58. $-3x - 5y = 15$
59. $x - y = 7$ 60. $15x - y = 30$
61. $6x - 7y = -42$ 62. $5x + 2y = -20$
63. $y - 3x = 7$ 64. $4x - 3y = 6$
65. $0.2x + 0.4y = 0.8$ 66. $\frac{2}{3}y - x = 1$
67. $y = 8x - 5$ 68. $y = -1.5x + 15$

Exercises 69–72: The **intercept form of a line** is $\frac{x}{a} + \frac{y}{b} = 1$. Determine the x - and y -intercepts on the graph of the equation. Draw a conclusion about what the constants a and b represent in this form.

69. $\frac{x}{5} + \frac{y}{7} = 1$ 70. $\frac{x}{2} + \frac{y}{3} = 1$
71. $\frac{2x}{3} + \frac{4y}{5} = 1$ 72. $\frac{5x}{6} - \frac{y}{2} = 1$

Exercises 73 and 74: (Refer to Exercises 69–72.) Write the intercept form for the line with the given intercepts.

73. x -intercept 5 , y -intercept 9
74. x -intercept $\frac{2}{3}$, y -intercept $-\frac{5}{4}$

Interpolation and Extrapolation

Exercises 75–78: The table lists data that are exactly linear.

- (a) Find the slope-intercept form of the line that passes through these data points.
- (b) Predict y when $x = -2.7$ and 6.3 . Decide if these calculations involve interpolation or extrapolation.

Exercises 49–56: Find an equation of the line satisfying the conditions.

49. Vertical, passing through $(-5, 6)$
50. Vertical, passing through $(1.95, 10.7)$
51. Horizontal, passing through $(-5, 6)$
52. Horizontal, passing through $(1.95, 10.7)$

75.

x	-3	-2	-1	0	1
y	-7.7	-6.2	-4.7	-3.2	-1.7

76.

x	-2	-1	0	1	2
y	10.2	8.5	6.8	5.1	3.4

77.

x	5	23	32	55	61
y	94.7	56.9	38	-10.3	-22.9

78.

x	-11	-8	-7	-3	2
y	-16.1	-10.4	-8.5	-0.9	8.6

79. **Air Safety Inspectors** The number of air safety inspectors for selected years is shown in the table.

Year	1998	1999	2000
Inspectors	3305	3185	3089

Source: Federal Aviation Administration.

- (a) Find a linear function f that models these data. Is f exact or approximate?
- (b) Use f to estimate the number of inspectors in 2005. Compare your answer to the actual value of 3450. Did your estimate involve interpolation or extrapolation?
- (c) Explain the difficulty with trying to model these data with a linear function.
80. **Deaths on School Grounds** Deaths on school grounds nationwide for school years ending in year x are shown in the table.

x (year)	1998	1999	2000
y (deaths)	43	26	9

Source: FBI.

- (a) Find a linear function f that models these data. Is f exact or approximate?
- (b) Use f to estimate the number of deaths on school grounds in 2003. Compare your answer to the actual value of 49. Did your estimate involve interpolation or extrapolation?
- (c) Explain the difficulty with trying to model these data with a linear function.

Applications

81. **Projected Cost of College** In 2003 the average annual cost of attending a private college or university, including tuition, fees, room, and board, was \$25,000. This cost is projected to rise to \$37,000 in 2010, as illustrated in the figure. (Source: Cerulli Associates.)

- (a) Find a point-slope form of the line passing through the points (2003, 25000) and (2010, 37000). Interpret the slope.
- (b) Use the equation to estimate the cost of attending a private college in 2007. Did your estimate involve interpolation or extrapolation?
- (c) Find the slope-intercept form of this line.
82. **Distance** A person is riding a bicycle along a straight highway. The graph shows the rider's distance y in miles from an interstate highway after x hours.

- (a) How fast is the bicyclist traveling?
- (b) Find the slope-intercept form of the line.
- (c) How far was the bicyclist from the interstate highway initially?
- (d) How far was the bicyclist from the interstate highway after 1 hour and 15 minutes?

83. **Music on the Internet** In 2002 sales of premium online music totaled \$1.6 billion. In 2005 this revenue reached \$3.6 billion. (Source: Jupiter Research.)

- Find a point-slope form of the line passing through (2002, 1.6) and (2005, 3.6). Interpret the slope.
- Use the equation to estimate projected sales in 2008. Did you use interpolation or extrapolation?
- Find the slope-intercept form of this line.

84. **Water in a Tank** The graph shows the amount of water in a 100-gallon tank after x minutes have elapsed.

- Is water entering or leaving the tank? How much water is in the tank after 3 minutes?
- Find the x - and y -intercepts. Interpret each intercept.
- Find the slope-intercept form of the equation of the line. Interpret the slope.
- Estimate the x -coordinate of the point $(x, 50)$ that lies on the line.

85. **E-mail Spam** The table lists the average number of worldwide spam messages *daily* in billions for selected years.

Year	1999	2000	2001	2002	2003	2004
Messages	1.0	2.3	4.0	5.6	7.3	8.8

Source: IDC.

- Make a scatterplot of the data.
- Find a linear function f that models these data. (Answers may vary.) Interpret the slope m .
- Use your function to estimate the average number of worldwide spam messages daily during 2007.

86. **Tuition and Fees** The table in the next column lists average tuition and fees at public 4-year colleges.

Year	1980	1985	1990
Tuition and fees	\$804	\$1318	\$1908

Year	1995	2000	2005
Tuition and fees	\$2811	\$3487	\$5491

Source: The College Board.

- Make a scatterplot of the data.
- Find a linear function that models the data. Interpret the slope m .
- Use this function to estimate tuition in 1992. Compare it to the actual value of \$2334.
- Of the six data values, which one would you remove to make the data “more linear”? Explain.

87. **Toyota Vehicles Sold** The table lists the U.S. sales of Toyota vehicles in millions.

Year	1998	2000	2002	2004
Vehicles	1.4	1.6	1.8	2.0

Source: Autodata.

- Make a scatterplot of the data.
- Find $f(x) = m(x - x_1) + y_1$ so that $f(x)$ models these data. Interpret the slope m .
- Is $f(x)$ an exact or approximate model for the data listed in the table?

88. **Farm Pollution** In 1988 the number of farm pollution incidents reported in England and Wales was 4000. This number had increased at a rate of 280 per year since 1979. (Source: C. Mason, *Biology of Freshwater Pollution*.)

- Find an equation $y = m(x - x_1) + y_1$ that models these data, where y represents the number of pollution incidents during the year x .

- Estimate the number of incidents in 1975.

89. **Cost of Driving** The cost of driving a car includes both fixed costs and mileage costs. Assume that insurance and car payments cost \$350 per month and gasoline, oil, and routine maintenance cost \$0.29 per mile.

- Find a linear function f that gives the annual cost of driving this car x miles.
- What does the y -intercept on the graph of f represent?

90. **Average Wages** The average hourly wage (adjusted to 1982 dollars) was \$8.46 in 1970 and \$8.18 in 2005. (Source: Department of Commerce.)

(a) Find an equation of a line that passes through the points (1970, 8.46) and (2005, 8.18).

(b) Interpret the slope.

(c) Approximate the hourly wage in 2000. Compare the estimate to the actual value of \$8.04.

 **Exercises 91 and 92: Modeling Real Data** The table contains data that can be modeled by a linear function f .

(a) Make a scatterplot of the data. (Do not try to plot the undetermined point in the table.)

(b) Find a formula for f . Graph f together with the data.

(c) Interpret the slope m .

(d) Use f to approximate the undetermined value.

91. Asian-American population in millions

Year	1996	1999	2002	2005	2008
Population	9.7	10.9	12.0	13.4	?

Source: Bureau of the Census.

92. Population of the western states in millions

Year	1950	1970	1990	2010
Population	20.2	34.8	52.8	?

Source: Bureau of the Census.

Perspectives and Viewing Rectangles

-  93. Graph $y = \frac{1}{1024}x + 1$ in $[0, 3, 1]$ by $[-2, 2, 1]$.

(a) Is the graph a horizontal line?

(b) Why does the calculator screen appear as it does?

-  94. Graph $y = 1000x + 1000$ in the standard window.

(a) Is the graph a vertical line?

(b) Explain why the calculator screen appears as it does.

-  95. **Square Viewing Rectangle** Graph the lines $y = 2x$ and $y = -\frac{1}{2}x$ in the standard viewing rectangle.

(a) Do the lines appear to be perpendicular?

(b) Graph the lines in the following viewing rectangles.

i. $[-15, 15, 1]$ by $[-10, 10, 1]$

ii. $[-10, 10, 1]$ by $[-3, 3, 1]$

iii. $[-3, 3, 1]$ by $[-2, 2, 1]$

Do the lines appear to be perpendicular in any of these viewing rectangles?

- (c) Determine the viewing rectangles where perpendicular lines will appear perpendicular. (Answers may vary.)

-  96. **Square Viewing Rectangle** Continuing with Exercise 95, make a conjecture about which viewing rectangles result in the graph of a circle with radius 5 and center at the origin appearing circular.

i. $[-9, 9, 1]$ by $[-6, 6, 1]$

ii. $[-5, 5, 1]$ by $[-10, 10, 1]$

iii. $[-5, 5, 1]$ by $[-5, 5, 1]$

iv. $[-18, 18, 1]$ by $[-12, 12, 1]$

Test your conjecture by graphing this circle in each viewing rectangle. (Hint: Graph $y_1 = \sqrt{25 - x^2}$ and $y_2 = -\sqrt{25 - x^2}$ to create the circle.)

Graphing a Rectangle

Exercises 97–100: (Refer to Example 9.) A rectangle is determined by the stated conditions. Find the slope-intercept form of the four lines that outline the rectangle.

97. Vertices (0, 0), (2, 2), and (1, 3)

98. Vertices (1, 1), (5, 1), and (5, 5)

99. Vertices (4, 0), (0, 4), (0, -4), and (-4, 0)

100. Vertices (1, 1) and (2, 3); the point (3.5, 1) lies on a side of the rectangle.

Direct Variation

Exercises 101–104: Let y be directly proportional to x . Complete the following.

101. Find y when $x = 5$, if $y = 7$ when $x = 14$.

102. Find y when $x = 2.5$, if $y = 13$ when $x = 10$.

103. Find y when $x = \frac{1}{2}$, if $y = \frac{3}{2}$ when $x = \frac{2}{3}$.

104. Find y when $x = 1.3$, if $y = 7.2$ when $x = 5.2$.

Exercises 105–108: Find the constant of proportionality k and the undetermined value in the table if y is directly proportional to x . Support your answer by graphing the equation $y = kx$ and the data points.

105.

x	3	5	6	8
y	7.5	12.5	15	?

106.

x	1.2	4.3	5.7	?
y	3.96	14.19	18.81	23.43

107. Sales tax
- y
- on a purchase of
- x
- dollars

x	\$25	\$55	?
y	\$1.50	\$3.30	\$5.10

108. Cost
- y
- of buying
- x
- compact discs having the same price

x	3	4	5
y	\$41.97	\$55.96	?

109. **Cost of Tuition** The cost of tuition is directly proportional to the number of credits taken. If 11 credits cost \$720.50, find the cost of taking 16 credits. What is the constant of proportionality?
110. **Strength of a Beam** The maximum load that a horizontal beam can carry is directly proportional to its width. If a beam 1.5 inches wide can support a load of 250 pounds, find the load that a beam of the same type can support if its width is 3.5 inches.
111. **Antarctic Ozone Layer** Stratospheric ozone occurs in the atmosphere between altitudes of 12 and 18 miles. Ozone in the stratosphere is frequently measured in Dobson units, where 300 Dobson units corresponds to an ozone layer 3 millimeters thick. In 1991 the reported minimum in the Antarctic ozone hole was about 110 Dobson units. (Source: R. Huffman, *Atmospheric Ultraviolet Remote Sensing*.)
- (a) The thickness y of the ozone layer is directly proportional to the number of Dobson units x . Find the constant of proportionality k .
- (b) How thick was the ozone layer in 1991?
112. **Weight on Mars** The weight of an object on Earth is directly proportional to the weight of an object on Mars. If a 25-pound object on Earth weighs 10 pounds on Mars, how much would a 195-pound astronaut weigh on Mars?
113. **Hooke's Law** Suppose a 15-pound weight stretches a spring 8 inches, as shown in the figure.

- (a) Find the spring constant.
- (b) How far will a 25-pound weight stretch this spring?

- 114.
- Hooke's Law**
- If an 80-pound force compresses a spring 3 inches, how much force must be applied to compress the spring 7 inches?

- 115.
- Force of Friction**
- The table lists the force
- F
- needed to push a cargo box weighing
- x
- pounds on a wood floor.

x (lb)	150	180	210	320
F (lb)	26	31	36	54

- (a) Compute the ratio $\frac{F}{x}$ for each data pair in the table. Interpret these ratios.
- (b) Approximate a constant of proportionality k satisfying $F = kx$. (k is the coefficient of friction.)
- (c) Graph the data and the equation together.
- (d) Estimate the force needed to push a 275-pound cargo box on the floor.

- 116.
- Electrical Resistance**
- The electrical resistance of a wire varies directly with its length. If a 255-foot wire has a resistance of 1.2 ohms, find the resistance of 135 feet of the same type of wire. Interpret the constant of proportionality in this situation.

Writing about Mathematics

117. Compare the slope-intercept form with the point-slope form. Give examples of each.
118. Give an example of two quantities in real life that vary directly. Explain your answer. Use an equation to describe the relationship between the two quantities.
119. The graph of $f(x) = 3 - 2x$ passes through $(-1, 5)$ and $(3, -3)$. Evaluate $f(1)$ and find the midpoint of the two points. Compare and explain your results.
120. Explain how you would find the equation of a line passing through two points. Give an example.

EXTENDED AND DISCOVERY EXERCISES

Exercises 1 and 2: Estimating Populations Biologists sometimes use direct variation to estimate the number of fish in small lakes. They start by tagging a small number of fish and then releasing them. They assume that over a period of time, the tagged fish distribute themselves evenly throughout the lake. Later, they collect a second sample. The total

number of fish and the number of tagged fish in the second sample are counted. To determine the total population of fish in the lake, biologists assume that the proportion of tagged fish in the second sample is equal to the proportion of tagged fish in the entire lake. This technique can also be used to count other types of animals, such as birds, when they are not migrating.

1. Eighty-five fish are tagged and released into a pond. A later sample of 94 fish from the pond contains 13 tagged fish. Estimate the number of fish in the pond.
2. Sixty-three blackbirds are tagged and released. Later it is estimated that out of a sample of 32 blackbirds, only 8 are tagged. Estimate the population of blackbirds in the area.

CHECKING BASIC CONCEPTS FOR SECTIONS 2.1 AND 2.2

1. Graph $f(x) = 4 - 2x$ by hand. Identify the slope, the x -intercept, and the y -intercept.
2. The death rate from heart disease for people ages 15 through 24 is 2.7 per 100,000 people.
 - (a) Write a function f that models the number of deaths in a population of x million people 15 to 24 years old.
 - (b) There are about 39 million people in the United States who are 15 to 24 years old. Estimate the number of deaths from heart disease in this age group.
3. A driver of a car is initially 50 miles south of home, driving 60 miles per hour south. Write a function f that models the distance between the driver and home.
4. Find an equation of the line passing through the points $(-3, 4)$ and $(5, -2)$. Give equations of lines that are parallel and perpendicular to this line.
5. Find equations of horizontal and vertical lines that pass through the point $(-4, 7)$.
6. Write the slope-intercept form of the line.
7. Find the x - and y -intercepts of the graph of the equation $-3x + 2y = -18$.

2.3 Linear Equations

- Learn about equations and recognize a linear equation
- Solve linear equations symbolically
- Solve linear equations graphically and numerically
- Solve problems involving percentages
- Apply problem-solving strategies

Introduction

In Example 4 of Section 2.2, we modeled iPod sales y in millions during year x with the equation of a line, or *linear function*, given by

$$f(x) = 21(x - 2004) + 4.4.$$

To predict the year when iPod sales might be 130 million, we could set the formula for $f(x)$ equal to 130 and solve the *linear equation*

$$130 = 21(x - 2004) + 4.4$$

for x . This section discusses linear equations and their solutions. See Example 4 in this section.

Equations

An **equation** is a statement that two mathematical expressions are equal. Equations always contain an equals sign. Some examples of equations include

$$x + 15 = 9x - 1, \quad x^2 - 2x + 1 = 2x, \quad z + 5 = 0, \\ xy + x^2 = y^3 + x, \quad \text{and} \quad 1 + 2 = 3.$$

The first three equations have one variable, the fourth equation has two variables, and the fifth equation contains only constants. For now, our discussion concentrates on equations with one variable.

To **solve** an equation means to find all values for the variable that make the equation a true statement. Such values are called **solutions**. The set of all solutions is the **solution set**. The solutions to the equation $x^2 - 1 = 0$ are 1 or -1 , written as $x = \pm 1$. Either value for x **satisfies** the equation. The solution set is $\{-1, 1\}$. Two equations are **equivalent** if they have the same solution set. For example, the equations $x + 2 = 5$ and $x = 3$ are equivalent.

If an equation has no solutions, then its solution set is empty and the equation is called a **contradiction**. The equation $x + 2 = x$ has no solutions and is a contradiction. However, if every (meaningful) value for the variable is a solution, then the equation is an **identity**. The equation $x + x = 2x$ is an identity because every value for x makes the equation true. Any equation that is satisfied by some, but not all, values of the variable is a **conditional equation**. The equation $x^2 - 1 = 0$ is a conditional equation. Only the values -1 and 1 for x make this equation a true statement.

Like functions, equations can be either *linear* or *nonlinear*. A linear equation is one of the simplest types of equations.

Linear Equation in One Variable

A **linear equation** in one variable is an equation that can be written in the form

$$ax + b = 0,$$

where a and b are constants with $a \neq 0$.

If an equation is not linear, then we say that it is a **nonlinear equation**. The following are examples of linear equations. In each case, rules of algebra could be used to write the equation in the form $ax + b = 0$ with $a \neq 0$. A linear equation has *exactly one* solution: $-\frac{b}{a}$.

$$x - 12 = 0, \quad 2x - 4 = -x, \quad 2(1 - 4x) = 16, \quad x - 5 + 3(x - 1) = 0$$

Symbolic Solutions

Linear equations can be solved symbolically, and the solution is *always exact*. To solve a linear equation symbolically, we usually apply the *properties of equality* to the given equation and transform it into an equivalent equation that is simpler.

Properties of Equality

Addition Property of Equality

If a , b , and c are real numbers, then

$$a = b \text{ is equivalent to } a + c = b + c.$$

Multiplication Property of Equality

If a , b , and c are real numbers with $c \neq 0$, then

$$a = b \text{ is equivalent to } ac = bc.$$

Loosely speaking, the addition property states that “if equals are added to equals, the results are equal.” For example, if $x + 5 = 15$, then we can add -5 to each side of the equation, or equivalently subtract 5 from each side, to obtain the following.

$$\begin{aligned}x + 5 &= 15 && \text{Given equation} \\x + 5 - 5 &= 15 - 5 && \text{Subtract 5 from each side.} \\x &= 10 && \text{Simplify.}\end{aligned}$$

Similarly, the multiplication property states that “if equals are multiplied by nonzero equals, the results are equal.” For example, if $5x = 20$, then we can multiply each side by $\frac{1}{5}$, or equivalently divide each side by 5, to obtain the following.

$$\begin{aligned}5x &= 20 && \text{Given equation} \\\frac{5x}{5} &= \frac{20}{5} && \text{Divide each side by 5.} \\x &= 4 && \text{Simplify.}\end{aligned}$$

These two properties along with the distributive property are applied in the next two examples.

EXAMPLE 1 Solving a linear equation symbolically

Solve the equation $3(x - 4) = 2x - 1$. Check your answer.

SOLUTION

Getting Started First we apply the distributive property: $a(b - c) = ab - ac$. Thus

$$3(x - 4) = 3 \cdot x - 3 \cdot 4 = 3x - 12. \blacktriangleright$$

Solving the given equation results in the following.

$$\begin{aligned}3(x - 4) &= 2x - 1 && \text{Given equation} \\3x - 12 &= 2x - 1 && \text{Distributive property} \\3x - 2x - 12 + 12 &= 2x - 2x - 1 + 12 && \text{Subtract } 2x \text{ and add } 12. \\3x - 2x &= 12 - 1 && \text{Simplify.} \\x &= 11 && \text{Simplify.}\end{aligned}$$

The solution is 11. We can check our answer as follows.

$$\begin{aligned}3(x - 4) &= 2x - 1 && \text{Given equation} \\3(11 - 4) &\stackrel{?}{=} 2 \cdot 11 - 1 && \text{Let } x = 11. \\21 &= 21 && \text{The answer checks.}\end{aligned}$$

Now Try Exercise 23 ◀

EXAMPLE 2 Solving a linear equation symbolically

Solve $3(2x - 5) = 10 - (x + 5)$. Check your answer.

SOLUTION

Getting Started In this problem subtraction must be distributed over the quantity $(x + 5)$. Thus

$$10 - (x + 5) = 10 - 1(x + 5) = 10 - x - 5. \blacktriangleright$$

Algebra Review

To review the distributive properties, see Chapter R (page R-15).

Solving the given equation results in the following.

$$\begin{array}{ll}
 3(2x - 5) = 10 - (x + 5) & \text{Given equation} \\
 6x - 15 = 10 - x - 5 & \text{Distributive property} \\
 6x - 15 = 5 - x & \text{Simplify.} \\
 7x - 15 = 5 & \text{Add } x \text{ to each side.} \\
 7x = 20 & \text{Add 15 to each side.} \\
 x = \frac{20}{7} & \text{Divide each side by 7.}
 \end{array}$$

The solution is $\frac{20}{7}$. To check this answer, let $x = \frac{20}{7}$ and simplify.

$$\begin{array}{ll}
 3(2x - 5) = 10 - (x + 5) & \text{Given equation} \\
 3\left(2 \cdot \frac{20}{7} - 5\right) \stackrel{?}{=} 10 - \left(\frac{20}{7} + 5\right) & \text{Let } x = \frac{20}{7}. \\
 \frac{15}{7} = \frac{15}{7} & \text{The answer checks.}
 \end{array}$$

Now Try Exercise 27 ◀

Fractions and Decimals When fractions or decimals appear in an equation, we sometimes can make our work simpler by multiplying each side of the equation by the least common denominator (LCD) or a common denominator of all fractions in the equation. This method is illustrated in the next example.

EXAMPLE 3 Eliminating fractions and decimals

Solve each linear equation.

$$(a) \frac{t-2}{4} - \frac{1}{3}t = 5 - \frac{1}{12}(3-t) \quad (b) 0.03(z-3) - 0.5(2z+1) = 0.23$$

SOLUTION

(a) To eliminate fractions, multiply each side (or term in the equation) by the LCD, 12.

$$\begin{array}{ll}
 \frac{t-2}{4} - \frac{1}{3}t = 5 - \frac{1}{12}(3-t) & \text{Given equation} \\
 \frac{12(t-2)}{4} - \frac{12}{3}t = 12(5) - \frac{12}{12}(3-t) & \text{Multiply each side (term) by 12.} \\
 3(t-2) - 4t = 60 - (3-t) & \text{Simplify.} \\
 3t - 6 - 4t = 60 - 3 + t & \text{Distributive property} \\
 -t - 6 = 57 + t & \text{Combine like terms on each side.} \\
 -2t = 63 & \text{Add } -t \text{ and 6 to each side.} \\
 t = -\frac{63}{2} & \text{Divide each side by } -2.
 \end{array}$$

The solution is $-\frac{63}{2}$.

Algebra Review

To review least common multiples and least common denominators, see Chapter R (page R-32).

(b) To eliminate decimals, multiply each side (or term in the equation) by 100.

$$\begin{aligned}
 0.03(z - 3) - 0.5(2z + 1) &= 0.23 && \text{Given equation} \\
 3(z - 3) - 50(2z + 1) &= 23 && \text{Multiply each side (term) by 100.} \\
 3z - 9 - 100z - 50 &= 23 && \text{Distributive property} \\
 -97z - 59 &= 23 && \text{Combine like terms.} \\
 -97z &= 82 && \text{Add 59 to each side.} \\
 z &= -\frac{82}{97} && \text{Divide each side by } -97.
 \end{aligned}$$

The solution is $-\frac{82}{97}$.

Now Try Exercises 33 and 37 ◀

An Application In the next example we solve the equation presented in the introduction to this section.

EXAMPLE 4 Estimating iPod sales

The linear function defined by $f(x) = 21(x - 2004) + 4.4$ estimates iPod sales (in millions of units) during fiscal year x . Use $f(x)$ to estimate when iPod sales could reach 130 million.

SOLUTION

We need to find x so that $f(x) = 130$.

$$\begin{aligned}
 21(x - 2004) + 4.4 &= 130 && \text{Equation to be solved} \\
 21(x - 2004) &= 125.6 && \text{Subtract 4.4 from each side.} \\
 21x - 42,084 &= 125.6 && \text{Distributive property} \\
 21x &= 42,209.6 && \text{Add 42,084 to each side.} \\
 x &= \frac{42,209.6}{21} && \text{Divide each side by 21.} \\
 x &\approx 2010 && \text{Approximate.}
 \end{aligned}$$

This model predicts that iPod sales could reach 130 million units in fiscal 2010.

Now Try Exercise 91 ◀

Contradictions, Identities, and Conditional Equations The next example illustrates how an equation can have no solutions (contradiction), one solution (conditional equation), or infinitely many solutions (identity).

EXAMPLE 5 Identifying contradictions, identities, and conditional equations

Identify each equation as a contradiction, identity, or conditional equation.

- (a) $7 + 6x = 2(3x + 1)$ (b) $2x - 5 = 3 - (1 + 2x)$
 (c) $2(5 - x) - 25 = 3(x - 5) - 5x$

SOLUTION

$$\begin{aligned}
 \text{(a)} \quad 7 + 6x &= 2(3x + 1) && \text{Given equation} \\
 7 + 6x &= 6x + 2 && \text{Distributive property} \\
 7 &= 2 && \text{Subtract } 6x \text{ from each side.}
 \end{aligned}$$

The statement $7 = 2$ is false and there are *no* solutions. The equation is a contradiction.

$$\begin{array}{ll}
 \text{(b)} & 2x - 5 = 3 - (1 + 2x) \quad \text{Given equation} \\
 & 2x - 5 = 3 - 1 - 2x \quad \text{Distributive property} \\
 & 4x = 7 \quad \text{Add 2x and 5 to each side.} \\
 & x = \frac{7}{4} \quad \text{Divide each side by 4.}
 \end{array}$$

There is one solution: $\frac{7}{4}$. This is a conditional equation.

$$\begin{array}{ll}
 \text{(c)} & 2(5 - x) - 25 = 3(x - 5) - 5x \quad \text{Given equation} \\
 & 10 - 2x - 25 = 3x - 15 - 5x \quad \text{Distributive property} \\
 & -2x - 15 = -2x - 15 \quad \text{Simplify each side.} \\
 & 0 = 0 \quad \text{Add 2x and 15 to each side}
 \end{array}$$

The statement $0 = 0$ is true and the solution set includes *all real numbers*. The equation is an identity.

Now Try Exercises 39, 41, and 43 ◀

Figure 2.32

Graphical and Numerical Solutions

Graphical Solutions The equation $f(x) = g(x)$ results whenever the formulas for two functions f and g are set equal to each other. A solution to this equation corresponds to the x -coordinate of a point where the graphs of f and g intersect. This technique is called the *intersection-of-graphs method*. If the graphs of f and g are lines with different slopes, then their graphs intersect once. For example, if $f(x) = 2x + 1$ and $g(x) = -x + 4$, then the equation $f(x) = g(x)$ becomes $2x + 1 = -x + 4$. To apply the intersection-of-graphs method, we graph $y_1 = 2x + 1$ and $y_2 = -x + 4$, as shown in Figure 2.32.

Their graphs intersect at the point $(1, 3)$. Because the variable in the given equation $2x + 1 = -x + 4$ is x , the solution is 1, the x -coordinate of the point of intersection. When $x = 1$, the functions f and g both assume the value 3—that is, $f(1) = 2(1) + 1 = 3$ and $g(1) = -1 + 4 = 3$. The value 3 is the y -coordinate of the point of intersection $(1, 3)$.

The intersection-of-graphs method is summarized below.

Intersection-of-Graphs Method

The **intersection-of-graphs method** can be used to solve an equation graphically.

- STEP 1:** Set y_1 equal to the left side of the equation, and set y_2 equal to the right side of the equation.
- STEP 2:** Graph y_1 and y_2 .
- STEP 3:** Locate any points of intersection. The x -coordinates of these points correspond to solutions to the equation.

EXAMPLE Solving an equation graphically and symbolically

Solve $2x - 1 = \frac{1}{2}x + 2$ graphically and symbolically.

SOLUTION

Graphical Solution Graph $y_1 = 2x - 1$ and $y_2 = \frac{1}{2}x + 2$. Their graphs intersect at the point $(2, 3)$, as shown in Figure 2.33, so the solution is 2. Figure 2.34 shows these graphs as created by a graphing calculator.

Figure 2.33 Intersection of Graphs

$[-6, 8, 2]$ by $[-6, 8, 2]$

Figure 2.34

Symbolic Solution $2x - 1 = \frac{1}{2}x + 2$ *Given equation*

$2x = \frac{1}{2}x + 3$ *Add 1 to each side.*

$\frac{3}{2}x = 3$ *Subtract $\frac{1}{2}x$ from each side.*

$\frac{2}{3} \cdot \frac{3}{2}x = \frac{2}{3} \cdot 3$ *Multiply each side by $\frac{2}{3}$.*

$x = 2$ *Multiply fractions.*

The solution is 2 and agrees with the graphical solution.

Now Try Exercise 53 ◀

EXAMPLE 1 Applying the intersection-of-graphs method

During the 1990s, compact discs were a new technology that replaced cassette tapes. The percentage share of music sales (in dollars) held by compact discs from 1987 to 1998 could be modeled by $f(x) = 5.91x + 13.7$. During the same time period the percentage share of music sales held by cassette tapes could be modeled by $g(x) = -4.71x + 64.7$. In these formulas $x = 0$ corresponds to 1987, $x = 1$ to 1988, and so on. Use the intersection-of-graphs method to estimate the year when the percentage share of CDs equaled the percentage share of cassettes. (Source: Recording Industry Association of America.)

SOLUTION We must solve the linear equation $f(x) = g(x)$, or equivalently,

$$5.91x + 13.7 = -4.71x + 64.7.$$

Graph $Y_1 = 5.91X + 13.7$ and $Y_2 = -4.71X + 64.7$, as in Figure 2.35. In Figure 2.36 their graphs intersect near the point $(4.8, 42.1)$. Since $x = 0$ corresponds to 1987 and $1987 + 4.8 \approx 1992$, it follows that in 1992 sales of CDs and cassette tapes were approximately equal. Each had about 42.1% of the sales in 1992.

Calculator Help

To find the point of intersection in Figure 2.36, see Appendix A (page AP-8).

$[0, 12, 2]$ by $[0, 100, 10]$

2001	16864
2002	17495

X = 1999

Figure 2.37

Calculator Help

To make a table of values, see Appendix A (page AP-6).

Numerical Solutions Equations can be solved symbolically and graphically, as demonstrated in the previous examples. Sometimes it is also possible to find a numerical solution to an equation by using a table of values. When the solution is an integer or a convenient fraction, we can usually find it by using the table feature on a graphing calculator. However, when the solution is a fraction with a repeating decimal or an irrational number, a numerical method gives only an approximate solution. In Example 10 of Section 2.2, we constructed the formula

$$f(x) = 630.8(x - 1980) + 3617$$

to model tuition and fees at private colleges and universities during year x . To determine when tuition and fees were about \$15,600, we could solve the equation

$$630.8(x - 1980) + 3617 = 15,600$$

for x by making a table of values for $f(x)$, as shown in Figure 2.37. By scrolling through the x -values, we can see that tuition and fees at private schools were about \$15,600 in 1999. This equation could also be solved symbolically and graphically.

NOTE Regardless of whether we use a symbolic, graphical, or numerical method to solve an equation, we should find the same solution set. However, our answers may differ slightly because of rounding.

EXAMPLE 8 Solving an equation numerically

Solve $\sqrt{3}(2x - \pi) + \frac{1}{3}x = 0$ numerically to the nearest tenth.

SOLUTION Enter $Y_1 = \sqrt{3}(2X - \pi) + X/3$ and make a table for y_1 , incrementing by 1, as shown in Figure 2.38. This table shows that when $x = 1$, $y_1 < 0$, and when $x = 2$, $y_1 > 0$. Thus the solution is located in the interval $1 < x < 2$. To obtain a more accurate answer, make a table for y_1 starting at 1 and incrementing by 0.1, as shown in Figure 2.39. Now we see that the solution lies in the interval $1.4 < x < 1.5$, which starts at 1.4 and increments by 0.01, we see that the solution lies in the interval $1.43 < x < 1.44$. To the nearest tenth, the solution is 1.4.

MAKING CONNECTIONS

Symbolic, Graphical, and Numerical Solutions Linear equations can be solved symbolically, graphically, and numerically. Symbolic solutions to linear equations are *always exact*, whereas graphical and numerical solutions are *sometimes approximate*. The following example illustrates how to solve the equation $2x - 1 = 3$ with each method.

Symbolic Solution

$$\begin{aligned} 2x - 1 &= 3 \\ 2x &= 4 \\ x &= 2 \end{aligned}$$

Check:

$$\begin{aligned} 2(2) - 1 &\stackrel{?}{=} 3 \\ 3 &= 3 \end{aligned}$$

It checks.

Graphical Solution

The solution is 2.

Numerical Solution

x	0	1	2	3
2x - 1	-1	1	3	5

Because $2x - 1$ equals 3 when $x = 2$, the solution to $2x - 1 = 3$ is 2.

Percentages Applications involving percentages often result in linear equations because percentages can be computed by linear functions. A function for taking P percent of x is given by $f(x) = \frac{P}{100}x$, where $\frac{P}{100}$ is the decimal form for P percent. For example, to calculate 35% of x , let $f(x) = 0.35x$. Then 35% of \$150 is $f(150) = 0.35(150) = 52.5$, or \$52.50.

EXAMPLE 9 Solving an application involving percentages

A survey found that 76% of bicycle riders do not wear helmets. (Source: Opinion Research Corporation for Glaxo Wellcome, Inc.)

- Find a formula $f(x)$ for a function that computes the number of people who do not wear helmets among x bicycle riders.
- There are approximately 38.7 million riders of all ages who do not wear helmets. Find the total number of bicycle riders.

SOLUTION

- A function f that computes 76% of x is given by $f(x) = 0.76x$.
- We must find the x -value for which $f(x) = 38.7$ million, or solve the equation $0.76x = 38.7$. Solving gives $x = \frac{38.7}{0.76} \approx 50.9$ million bike riders.

Now Try Exercise 99 ◀

Solving for a Variable

The circumference C of a circle is given by $C = 2\pi r$, where r is the radius. This equation is *solved* for C . That is, given r , we can easily calculate C . For example, if $r = 4$, then $C = 2\pi(4)$, or $C = 8\pi$. However, if we are given C , then it is more work to calculate r . Solving the equation for r makes it simpler to calculate r .

$$C = 2\pi r \quad \text{Given equation}$$

$$\frac{C}{2\pi} = r \quad \text{Divide each side by } 2\pi.$$

The equation $r = \frac{C}{2\pi}$ is solved for r .

EXAMPLE 10 Solving for a variable

The area of a trapezoid with bases a and b and height h is given by $A = \frac{1}{2}h(a + b)$. Solve this equation for b .

SOLUTION

Getting Started If we multiply each side by 2 and divide each side by h , the right side of the equation becomes $a + b$. Subtracting a from each side isolates b . ▶

$$A = \frac{1}{2}h(a + b) \quad \text{Given equation}$$

$$2A = h(a + b) \quad \text{Multiply each side by 2.}$$

$$\frac{2A}{h} = a + b \quad \text{Divide each side by } h.$$

$$\frac{2A}{h} - a = b \quad \text{Subtract } a \text{ from each side.}$$

The equation $b = \frac{2A}{h} - a$ is solved for b .

Now Try Exercise 85 ◀

Problem-Solving Strategies

To become more proficient at solving problems, we need to establish a procedure to guide our thinking. The following steps may be helpful in solving application problems.

Solving Application Problems

- STEP 1:** Read the problem and make sure you understand it. Assign a variable to what you are being asked to find. If necessary, write other quantities in terms of this variable.
- STEP 2:** Write an equation that relates the quantities described in the problem. You may need to sketch a diagram and refer to known formulas.
- STEP 3:** Solve the equation and determine the solution.
- STEP 4:** Look back and check your solution. Does it seem reasonable?

These steps are applied in the next four examples.

EXAMPLE 11 Working together

A large pump can empty a tank of gasoline in 5 hours, and a smaller pump can empty the same tank in 9 hours. If both pumps are used to empty the tank, how long will it take?

SOLUTION

- STEP 1:** We are asked to find the time it takes for *both* pumps to empty the tank. Let this time be t .

t : Time to empty the tank

- STEP 2:** In 1 hour the large pump will empty $\frac{1}{5}$ of the tank and the smaller pump will empty $\frac{1}{9}$ of the tank. The fraction of the tank that they will empty together in 1 hour is given by $\frac{1}{5} + \frac{1}{9}$. In 2 hours the large pump will empty $\frac{2}{5}$ of the tank and the smaller pump will empty $\frac{2}{9}$ of the tank. The fraction of the tank that they will empty together in 2 hours is $\frac{2}{5} + \frac{2}{9}$. Similarly, in t hours the fraction of the tank that the two pumps can empty is $\frac{t}{5} + \frac{t}{9}$. Since the tank is empty when this fraction reaches 1, we must solve the following equation.

$$\frac{t}{5} + \frac{t}{9} = 1$$

- STEP 3:** Multiply by the LCD, 45, to eliminate fractions.

$$\begin{aligned} \frac{45t}{5} + \frac{45t}{9} &= 45 && \text{Multiply by LCD} \\ 9t + 5t &= 45 && \\ 14t &= 45 && \text{Add like terms.} \\ t &= \frac{45}{14} \approx 3.21 && \text{Divide by 14 and approximate.} \end{aligned}$$

Working together, the two pumps can empty the tank in about 3.21 hours.

STEP 4: This sounds reasonable. Working together the two pumps should be able to empty the tank faster than the large pump working alone, but not twice as fast. Note that $\frac{3.21}{5} + \frac{3.21}{9} \approx 1$.

Now Try Exercise 101 ◀

EXAMPLE 7 Solving an application involving motion

In 1 hour an athlete traveled 10.1 miles by running first at 8 miles per hour and then at 11 miles per hour. How long did the athlete run at each speed?

SOLUTION

STEP 1: We are asked to find the time spent running at each speed. If we let x represent the time in hours spent running at 8 miles per hour, then $1 - x$ represents the time spent running at 11 miles per hour because the total running time was 1 hour.

x : Time spent running at 8 miles per hour

$1 - x$: Time spent running at 11 miles per hour

STEP 2: Distance d equals rate r times time t ; that is, $d = rt$. In this example we have two rates (or speeds) and two times. The total distance must sum to 10.1 miles.

$$d = r_1t_1 + r_2t_2 \quad \text{General equation}$$

$$10.1 = 8x + 11(1 - x) \quad \text{Substitute.}$$

STEP 3: We can solve this equation symbolically.

$$10.1 = 8x + 11 - 11x \quad \text{Distributive property}$$

$$10.1 = 11 - 3x \quad \text{Combine like terms.}$$

$$3x = 0.9 \quad \text{Add } 3x; \text{ subtract } 10.1.$$

$$x = 0.3 \quad \text{Divide by } 3.$$

The athlete runs 0.3 hour (18 minutes) at 8 miles per hour and 0.7 hour (42 minutes) at 11 miles per hour.

STEP 4: We can check this solution as follows.

$$8(0.3) + 11(0.7) = 10.1 \quad \text{It checks.}$$

This sounds reasonable. The runner's average speed was 10.1 miles per hour so the runner must have run longer at 11 miles per hour than at 8 miles per hour.

Now Try Exercise 103 ◀

Similar triangles are often used in applications involving geometry. Similar triangles are used to solve the next application.

EXAMPLE 11 Solving an application involving similar triangles

A person 6 feet tall stands 17 feet from the base of a streetlight, as illustrated in Figure 2.41. If the person's shadow is 8 feet, estimate the height of the streetlight.

SOLUTION

STEP 1: We are asked to find the height of the streetlight in Figure 2.41. Let x represent this height.

x : Height of the streetlight

Figure 2.41

Figure 2.42

Geometry Review

To review similar triangles, see Chapter R (page R-5).

STEP 2: In Figure 2.42, triangle ADC is similar to triangle BEC . Thus ratios of corresponding sides are equal.

$$\frac{AD}{BE} = \frac{DC}{EC}$$

$$\frac{x}{6} = \frac{17 + 8}{8}$$

STEP 3: We can solve this equation symbolically.

$$\frac{x}{6} = \frac{25}{8} \quad \text{Simplify.}$$

$$x = \frac{6 \cdot 25}{8} \quad \text{Multiply by 6.}$$

$$x = 18.75 \quad \text{Simplify.}$$

The height of the streetlight is 18.75 feet.

STEP 4: One way to check this answer is to form a different proportion. Note that x is to $17 + 8$ in triangle ADC as 6 is to 8 in triangle BEC . If $x = 18.75$, then $\frac{18.75}{25} = \frac{6}{8}$, which is true, and our answer checks.

Now Try Exercise 107 ◀

EXAMPLE 14 Mixing acid in chemistry

Pure water is being added to 153 milliliters of a 30% solution of hydrochloric acid. How much water should be added to dilute the solution to a 13% mixture?

SOLUTION

STEP 1: We are asked to find the amount of water that should be added to 153 milliliters of 30% acid to make a 13% solution. Let this amount of water be equal to x . See Figure 2.43.

Figure 2.43

x : Amount of pure water to be added

$x + 153$: Final volume of 13% solution

STEP 2: Since only water is added, the total amount of acid in the solution after the water is added must equal the amount of acid before the water is added. The volume of pure acid after the water is added equals 13% of $x + 153$ milliliters, and the volume of pure acid before the water is added equals 30% of 153 milliliters. We must solve the following equation.

$$0.13(x + 153) = 0.30(153)$$

STEP 3: Begin by dividing each side by 0.13.

$$x + 153 = \frac{0.30(153)}{0.13} \quad \text{Divide by 0.13.}$$

$$x = \frac{0.30(153)}{0.13} - 153 \quad \text{Subtract 153.}$$

$$x \approx 200.08 \quad \text{Approximate.}$$

We should add about 200 milliliters of pure water.

STEP 4: Initially the solution contains $0.30(153) = 45.9$ milliliters of pure acid. If we add 200 milliliters of water to the 153 milliliters, the final solution is 353 milliliters, which includes 45.9 milliliters of pure acid. Its concentration is $\frac{45.9}{353} \approx 0.13$, or about 13%.

Now Try Exercise 111 ◀

2.3 Putting It All Together

A general four-step procedure for solving applications is found on page 122. The following table summarizes some of the important concepts in this section.

Concept	Explanation	Examples
Linear equation	A linear equation can be written as $ax + b = 0$, $a \neq 0$.	$4x + 5 = 0$ $3x - 1 = x + 2$
Addition property	$a = b$ is equivalent to $a + c = b + c$.	$x - 7 = 25$ $x - 7 + 7 = 25 + 7$ $x = 32$
Multiplication property	$a = b$ is equivalent to $ac = bc$, $c \neq 0$.	$\frac{1}{2}x = 4$ $2 \cdot \frac{1}{2}x = 4 \cdot 2$ $x = 8$
Distributive property	$a(b + c) = ab + ac$ $a(b - c) = ab - ac$	$2(5 + x) = 10 + 2x$ $-(2 - x) = -1(2 - x) = -2 + x$
Identity	An equation that is true for all (meaningful) values of the variable	$3(x - 2) = 3x - 6$ $2x + 3x = (2 + 3)x = 5x$
Contradiction	An equation that has no solutions	$x + 5 = x$ $2x - 2x = 5$
Conditional equation	An equation that is satisfied by some, but not all, of the values of the variable	$2x - 1 = 5$ <i>Given equation</i> $2x = 6$ <i>Add 1.</i> $x = 3$ <i>Divide by 2.</i>
Percentages	P percent of x equals $\frac{P}{100}x$, where $\frac{P}{100}$ is the decimal form for P percent.	35% of x is calculated by $f(x) = \frac{35}{100}x$, or $f(x) = 0.35x$.

continued on next page

continued from previous page

The following example illustrates how to solve $5x - 1 = 3$ symbolically, graphically, and numerically.

Symbolic Solution

$$5x - 1 = 3$$

$$5x = 4$$

$$x = \frac{4}{5}$$

Check:

$$5\left(\frac{4}{5}\right) - 1 \stackrel{?}{=} 3$$

$$4 - 1 \stackrel{?}{=} 3$$

$$3 = 3$$

Graphical Solution

[-9, 9, 1] by [-6, 6, 1]

The graphs of $y_1 = 5x - 1$ and $y_2 = 3$ intersect at $(0.8, 3)$, so the solution is 0.8 .

Numerical Solution

X	Y ₁	
.5	1.5	
.6	2	
.7	2.5	
.8	3	$y_1 = 3$
.9	3.5	
1	4	
1.1	4.5	
X=.8		

In the table, $y_1 = 3$ when $x = 0.8$.

2.3 Exercises

Concepts about Linear Equations

- How many solutions are there to $ax + b = 0$ with $a \neq 0$?
- How many times does the graph of $y = ax + b$ with $a \neq 0$ intersect the x -axis?
- Apply the distributive property to $4 - (5 - 4x)$.
- What property is used to solve $15x = 5$?
- If $f(x) = ax + b$ with $a \neq 0$, how are the zero of f and the x -intercept of the graph of f related?
- Distinguish between a contradiction and an identity.

Identifying Linear and Nonlinear Equations

Exercises 7–12: Determine whether the equation is linear or nonlinear by trying to write it in the form $ax + b = 0$.

- $3x - 1.5 = 7$
- $100 - 23x = 20x$
- $2\sqrt{x} + 2 = 1$
- $4x^3 - 7 = 0$
- $7x - 5 = 3(x - 8)$
- $2(x - 3) = 4 - 5x$

Solving Linear Equations Symbolically

Exercises 13–38: Solve the equation and check your answer.

- $2x - 8 = 0$
- $4x - 8 = 0$
- $-5x + 3 = 23$
- $-9x - 3 = 24$
- $4(z - 8) = z$
- $-3(2z - 1) = 2z$
- $-5(3 - 4t) = 65$
- $6(5 - 3t) = 66$
- $k + 8 = 5k - 4$
- $2k - 3 = k + 3$
- $2(1 - 3x) + 1 = 3x$
- $5(x - 2) = -2(1 - x)$
- $-5(3 - 2x) - (1 - x) = 4(x - 3)$
- $-3(5 - x) - (x - 2) = 7x - 2$
- $-4(5x - 1) = 8 - (x + 2)$
- $6(3 - 2x) = 1 - (2x - 1)$
- $\frac{2}{7}n + \frac{1}{5} = \frac{4}{7}$
- $\frac{6}{11} - \frac{2}{33}n = \frac{5}{11}n$
- $\frac{1}{2}(d - 3) - \frac{2}{3}(2d - 5) = \frac{5}{12}$

32. $\frac{7}{3}(2d - 1) - \frac{2}{5}(4 - 3d) = \frac{1}{5}d$

33. $\frac{x - 5}{3} + \frac{3 - 2x}{2} = \frac{5}{4}$

34. $\frac{3x - 1}{5} - 2 = \frac{2 - x}{3}$

35. $0.1z - 0.05 = -0.07z$ 36. $1.1z - 2.5 = 0.3(z - 2)$

37. $0.15t + 0.85(100 - t) = 0.45(100)$

38. $0.35t + 0.65(10 - t) = 0.55(10)$

Exercises 39–48: Complete the following.

(a) Solve the equation symbolically.

(b) Classify the equation as a contradiction, an identity, or a conditional equation.

39. $5x - 1 = 5x + 4$

40. $7 - 9z = 2(3 - 4z) - z$

41. $3(x - 1) = 5$ 42. $22 = -2(2x + 1.4)$

43. $0.5(x - 2) + 5 = 0.5x + 4$

44. $\frac{1}{2}x - 2(x - 1) = -\frac{3}{2}x + 2$

45. $\frac{t + 1}{2} = \frac{3t - 2}{6}$ 46. $\frac{2x + 1}{3} = \frac{2x - 1}{3}$

47. $\frac{1 - 2x}{4} = \frac{3x - 1.5}{-6}$

48. $0.5(3x - 1) + 0.5x = 2x - 0.5$

Solving Linear Equations Graphically

Exercises 49 and 50: A linear equation is solved by using the intersection-of-graphs method. Find the solution by interpreting the graph. Assume that the solution is an integer.

Exercises 51 and 52: Use the graph of $y = f(x)$ to solve each equation.

(a) $f(x) = -1$ (b) $f(x) = 0$ (c) $f(x) = 2$

Exercises 53–58: Use the intersection-of-graphs method to solve the equation. Then solve symbolically.

53. $x + 4 = 1 - 2x$

54. $2x = 3x - 1$

55. $-x + 4 = 3x$

56. $1 - 2x = x + 4$

57. $2(x - 1) - 2 = x$

58. $-(x + 1) - 2 = 2x$

Exercises 59–66: Solve the linear equation with the intersection-of-graphs method. Approximate the solution to the nearest thousandth whenever appropriate.

59. $5x - 1.5 = 5$

60. $8 - 2x = 1.6$

61. $3x - 1.7 = 1 - x$

62. $\sqrt{2}x = 4x - 6$

63. $3.1(x - 5) = \frac{1}{5}x - 5$

64. $65 = 8(x - 6) - 5.5$

65. $\frac{6 - x}{7} = \frac{2x - 3}{3}$

66. $\pi(x - \sqrt{2}) = 1.07x - 6.1$

Solving Linear Equations Numerically

Exercises 67–74: Use tables to solve the equation numerically to the nearest tenth.

67. $2x - 7 = -1$

68. $1 - 6x = 7$

69. $2x - 7.2 = 10$

70. $5.8x - 8.7 = 0$

71. $\sqrt{2}(4x - 1) + \pi x = 0$

72. $\pi(0.3x - 2) + \sqrt{2}x = 0$

73. $0.5 - 0.1(\sqrt{2} - 3x) = 0$

74. $\sqrt{5} - \pi(\pi + 0.3x) = 0$

Solving Linear Equations by More Than One Method

Exercises 75–82: Solve the equation (to the nearest tenth)

- (a) symbolically,
(b) graphically, and
(c) numerically.

75. $5 - (x + 1) = 3$

76. $7 - (3 - 2x) = 1$

77. $\sqrt{3}(2 - \pi x) + x = 0$

78. $3(\pi - x) + \sqrt{2} = 0$

79. $x - 3 = 2x + 1$

80. $3(x - 1) = 2x - 1$

81. $6x - 8 = -7x + 18$

82. $5 - 8x = 3(x - 7) + 37$

Solving for a Variable

Exercises 83–90: Solve the equation for the specified variable.

83. $A = LW$ for W

84. $E = IR + 2$ for R

85. $P = 2L + 2W$ for L

86. $V = 2\pi rh + \pi r^2$ for h

87. $3x + 2y = 8$ for y

88. $5x - 4y = 20$ for y

89. $y = 3(x - 2) + x$ for x

90. $y = 4 - (8 - 2x)$ for x

Applications

91. **Income** The per capita (per person) income from 1980 to 2006 can be modeled by

$$f(x) = 1000(x - 1980) + 10,000,$$

where x is the year. Determine the year when the per capita income was \$19,000. (Source: Bureau of the Census.)

92. **Tuition and Fees** In Example 10 of Section 2.2, we modeled tuition and fees in dollars during year x by

$$f(x) = 630.8(x - 1980) + 3617.$$

Use $f(x)$ to determine when tuition and fees reached \$13,700.

93. **Vinyl and CD Sales** During the 1980s, sales of compact discs surpassed vinyl record sales. From 1985 to 1990, sales of compact discs in millions can be modeled by the formula $f(x) = 51.6(x - 1985) + 9.1$, whereas sales of vinyl LP records in millions can be modeled by $g(x) = -31.9(x - 1985) + 167.7$. Approximate the year x when sales of LP records and compact discs were equal by using the intersection-of-graphs method. (Source: Recording Industry Association of America.)

94. **Median Age** The median age A in the United States during year x , where $2000 \leq x \leq 2050$, is projected to be

$$A(x) = 0.07(x - 2000) + 35.3.$$

Use $A(x)$ to estimate when the median age may reach 37 years. (Source: Bureau of the Census.)

95. **Population Density** In 1980 the population density of the United States was 64 people per square mile, and in 2000 it was 80 people per square mile. Use a linear function to estimate when the U.S. population density reached 87 people per square mile.
96. **Value of a Home** In 1999 the value of a house was \$180,000, and in 2009 it was \$245,000.
- Find a linear function V that approximates the value of the house during year x .
 - What does the slope of the graph of V represent?
 - Use V to estimate the year when the house was worth \$219,000.
97. **Sale Price** A store is discounting all regularly priced merchandise by 25%. Find a function f that computes the sale price of an item having a regular price of x . If an item normally costs \$56.24, what is its sale price?
98. **Sale Price** Continuing Exercise 97, use f to find the regular price of an item that costs \$19.62 on sale.

99. **Skin Cancer** Approximately 4.5% of all cancer cases diagnosed in 2007 were skin cancer. (Source: American Cancer Society.)

(a) If x cases of cancer were diagnosed, how many of these were skin cancer?

(b) There were 65,000 cases of skin cancer diagnosed in 2007. Find the total number of cancer cases in 2007.

100. **Grades** In order to receive an A in a college course it is necessary to obtain an average of 90% correct on three 1-hour exams of 100 points each and on one final exam of 200 points. If a student scores 82, 88, and 91 on the 1-hour exams, what is the minimum score that the person can receive on the final exam and still earn an A?

101. **Working Together** Suppose that a lawn can be raked by one gardener in 3 hours and by a second gardener in 5 hours.

(a) Mentally estimate how long it will take the two gardeners to rake the lawn working together.

(b) Solve part (a) symbolically.

102. **Pumping Water** Suppose that a large pump can empty a swimming pool in 50 hours and a small pump can empty the pool in 80 hours. How long will it take to empty the pool if both pumps are used?

103. **Motion** A car went 372 miles in 6 hours, traveling part of the time at 55 miles per hour and part of the time at 70 miles per hour. How long did the car travel at each speed?

104. **Mixing Candy** Two types of candy sell for \$2.50 per pound and \$4.00 per pound. A store clerk is trying to make a 5-pound mixture worth \$17.60. How much of each type of candy should be included in the mixture?

105. **Running** At 2:00 P.M. a runner heads north on a highway, jogging at 10 miles per hour. At 2:30 P.M. a driver heads north on the same highway to pick up the runner. If the car travels at 55 miles per hour, how long will it take the driver to catch the runner?

106. **Investments** A total of \$5000 was invested in two accounts. One pays 5% annual interest, and the second pays 7% annual interest. If the first-year interest is \$325, how much was invested in each account?

107. **Shadow Length** A person 66 inches tall is standing 15 feet from a streetlight. If the person casts a shadow 84 inches long, how tall is the streetlight?

108. **Height of a Tree** In the accompanying figure, a person 5 feet tall casts a shadow 4 feet long. A nearby tree casts a shadow 33 feet long. Find the height of the tree by solving a linear equation.

109. **Conical Water Tank** A water tank in the shape of an inverted cone has a height of 11 feet and a radius of 3.5 feet, as illustrated in the figure. If the volume of the cone is $V = \frac{1}{3}\pi r^2 h$, find the volume of the water in the tank when the water is 7 feet deep. (Hint: Consider using similar triangles.)

110. **Dimension of a Cone** (Refer to Exercise 109.) A conical water tank holds 100 cubic feet of water and has a diameter of 6 feet. Estimate its height to the nearest tenth of a foot.

111. **Chemistry** Determine how much pure water should be mixed with 5 liters of a 40% solution of sulfuric acid to make a 15% solution of sulfuric acid.

112. **Mixing Antifreeze** A radiator holds 5 gallons of fluid. If it is full with a 15% solution, how much fluid should be drained and replaced with a 65% antifreeze mixture to result in a 40% antifreeze mixture?

113. **Window Dimensions** A rectangular window has a length that is 18 inches more than its width. If its perimeter is 180 inches, find its dimensions.

- 114. Online Holiday Shopping** In 2003 online holiday sales were \$17 billion, and in 2006 they were \$26 billion. (Source: Digital Lifestyles.)
- Find a linear function S that models these data.
 - Interpret the slope of the graph of S .
 - Predict when online holiday sales might reach \$41 billion.
- 115. Sales of CRT and LCD Screens** In 2002, 75 million CRT (cathode ray tube) monitors were sold and 29 million flat LCD (liquid crystal display) monitors were sold. In 2006 the numbers were 45 million for CRT monitors and 88 million for LCD monitors. (Source: International Data Corporation.)
- Find a linear function C that models these data for CRT monitors and another linear function L that models these data for LCD monitors. Let x be the year.
 - Interpret the slopes of the graphs of C and of L .
 -  Determine graphically the year when sales of these two types of monitors were equal.
 - Solve part (c) symbolically.
 -  Solve part (c) numerically.
- 116. Geometry** A 174-foot-long fence is being placed around the perimeter of a rectangular swimming pool that has a 3-foot-wide sidewalk around it. The actual swimming pool without the sidewalk is twice as long as it is wide. Find the dimensions of the pool without the sidewalk.
- 117. Temperature Scales** The Celsius and Fahrenheit scales are related by the equation $C = \frac{5}{9}(F - 32)$. These scales have the same temperature reading at a unique value where $F = C$. Find this temperature.
- 118. Business** A company manufactures compact discs with recorded music. The master disc costs \$2000 to produce and copies cost \$0.45 each. If a company spent \$2990 producing compact discs, how many copies did the company manufacture?
- 119. Two-Cycle Engines** Two-cycle engines, used in snowmobiles, chain saws, and outboard motors, require a mixture of gasoline and oil. For certain engines the amount of oil in pints that should be added to x gallons of gasoline is computed by $f(x) = 0.16x$. (Source: Johnson Outboard Motor Company.)
- Why is it reasonable to expect f to be linear?
 - Evaluate $f(3)$ and interpret the answer.
 - How much gasoline should be mixed with 2 pints of oil?
- 120. Perimeter** Find the length of the longest side of the rectangle if its perimeter is 25 feet.

Modeling Data with Linear Functions

Exercises 121 and 122: The following data can be modeled by a linear function. Estimate the value of x when $y = 2.99$.

121.	x	2	4	6	8
	y	0.51	1.23	1.95	2.67

122.	x	1	2	3	4
	y	-1.66	2.06	5.78	9.50

Linear Regression

- 123. Ring Size** The table lists ring size S for a finger with circumference x in centimeters.

x (cm)	4.65	5.40	5.66	6.41
S (size)	4	7	8	11

Source: Overstock.

- Find a linear function S that models the data.
- Find the circumference of a finger with a ring size of 6.

- 124. Hat Size** The table lists hat size H for a head with circumference x in inches.

x (in.)	$21\frac{1}{8}$	$21\frac{7}{8}$	$22\frac{5}{8}$	25
S (size)	$6\frac{3}{4}$	7	$7\frac{1}{4}$	8

Source: Brentblack.

- (a) Find a linear function S that models the data.
- (b) Find the circumference of a head with a hat size of $7\frac{1}{2}$.

125. **Super Bowl Ads** The table lists the cost in millions of dollars for a 30-second Super Bowl commercial for selected years.

Year	1990	1994	1998	2004	2008
Cost	0.8	1.2	1.6	2.3	2.7

Source: MSNBC.

- (a) Find a linear function f that models the data.
- (b) Estimate the cost in 1987 and compare the estimate to the actual value of \$0.6 million. Did your estimate involve interpolation or extrapolation?
- (c) Use f to predict the year when the cost could reach \$3.2 million.

126. **Women in Politics** The table lists the percentage P of women in state legislatures during year x .

x	1993	1997	2001	2005	2007
P	20.5	21.6	22.4	22.7	23.5

Source: National Women's Political Caucus.

- (a) Find a linear function P that models the data.
- (b) Estimate this percentage in 2003 and compare the estimate to the actual value of 22.4%. Did your estimate involve interpolation or extrapolation?
- (c) Use P to predict the year when this percentage could reach 25%.

Writing about Mathematics

127. Describe a basic graphical method used to solve a linear equation. Give examples.
128. Describe verbally how to solve $ax + b = 0$. What assumptions have you made about the value of a ?

EXTENDED AND DISCOVERY EXERCISES

1. **Geometry** Suppose that two rectangles are similar and the sides of the first rectangle are twice as long as the corresponding sides of the second rectangle.

- (a) Is the perimeter of the first rectangle twice the perimeter of the second rectangle? Explain.
- (b) Is the area of the first rectangle twice the area of the second rectangle? Explain.

2. **Geometry** Repeat the previous exercise for an equilateral triangle. Try to make a generalization. (Hint: The area of an equilateral triangle is $A = \frac{\sqrt{3}}{4}x^2$, where x is the length of a side.) What will happen to the circumference of a circle if the radius is doubled? What will happen to its area?

3. **Indoor Air Pollution** Formaldehyde is an indoor air pollutant formerly found in plywood, foam insulation, and carpeting. When concentrations in the air reach 33 micrograms per cubic foot ($\mu\text{g}/\text{ft}^3$), eye irritation can occur. One square foot of new plywood could emit 140 μg per hour. (Source: A. Hines, *Indoor Air Quality & Control*.)

- (a) A room has 100 square feet of new plywood flooring. Find a linear function f that computes the amount of formaldehyde in micrograms that could be emitted in x hours.
- (b) The room contains 800 cubic feet of air and has no ventilation. Determine how long it would take for concentrations to reach 33 $\mu\text{g}/\text{ft}^3$.

4. **Temperature and Volume** The table shows the relationship between the temperature of a sample of helium and its volume.

Temperature ($^{\circ}\text{C}$)	0	25	50	75	100
Volume (in^3)	30	32.7	35.4	38.1	40.8

-  (a) Make a scatterplot of the data.
- (b) Write a formula for a function f that receives the temperature x as input and outputs the volume y of the helium.
- (c) Find the volume when the temperature is 65°C .
- (d) Find the temperature if the volume is 25 cubic inches. Did your answer involve interpolation or extrapolation? Do you believe that your answer is accurate?

2.4 Linear Inequalities

- Understand basic terminology related to inequalities
- Solve linear inequalities symbolically
- Solve linear inequalities graphically and numerically
- Solve compound inequalities

Introduction

If a person who weighs 143 pounds needs to purchase a life preserver for whitewater rafting, it is doubtful that there is one designed exactly for this weight. Life preservers are manufactured to support a range of body weights. A vest that is approved for weights between 120 and 160 pounds would be appropriate. Every airplane has a maximum weight allowance. It is important that this weight limit be accurately determined. However, most people feel more comfortable at takeoff if that maximum has not been reached, because any weight that is less than the maximum is also safe and allows a greater margin of error. Both of these situations involve the concept of inequality.

In mathematics much effort is expended in solving equations and determining equality. One reason is that equality is frequently a boundary between *greater than* and *less than*. The solution to an inequality often can be found by first locating where two expressions are equal. Since equality and inequality are closely related, many of the techniques used to solve equations also can be applied to inequalities.

Inequalities

Inequalities result whenever the equals sign in an equation is replaced with any one of the symbols $<$, \leq , $>$, or \geq . Some examples of inequalities include

$$x + 15 < 9x - 1, \quad x^2 - 2x + 1 \geq 2x, \quad z + 5 > 0, \\ xy + x^2 \leq y^3 + x, \quad \text{and} \quad 2 + 3 > 1.$$

The first three inequalities have one variable, the fourth inequality contains two variables, and the fifth inequality has only constants. As with linear equations, our discussion focuses on inequalities with one variable.

To **solve** an inequality means to find all values for the variable that make the inequality a true statement. Such values are **solutions**, and the set of all solutions is the **solution set** to the inequality. Two inequalities are **equivalent** if they have the same solution set. It is common for an inequality to have infinitely many solutions. For instance, the inequality $x - 1 > 0$ has infinitely many solutions because any real number x satisfying $x > 1$ is a solution. The solution set is $\{x | x > 1\}$.

Like functions and equations, inequalities in one variable can be classified as *linear* or *nonlinear*.

Linear Inequality in One Variable

A **linear inequality** in one variable is an inequality that can be written in the form

$$ax + b > 0,$$

where $a \neq 0$. (The symbol $>$ may be replaced by \geq , $<$, or \leq .)

Examples of linear inequalities include

$$3x - 4 < 0, \quad 7x + 5 \geq x, \quad x + 6 > 23, \quad \text{and} \quad 7x + 2 \leq -3x + 6.$$

Using techniques from algebra, we can transform these inequalities into one of the forms $ax + b > 0$, $ax + b \geq 0$, $ax + b < 0$, or $ax + b \leq 0$. For example, by subtracting x

from each side of $7x + 5 \geq x$, we obtain the equivalent inequality $6x + 5 \geq 0$. If an inequality is not a linear inequality, it is called a **nonlinear inequality**.

MAKING CONNECTIONS

Linear Functions, Equations, and Inequalities These concepts are closely related.

$$f(x) = ax + b \quad \text{Linear function}$$

$$ax + b = 0, a \neq 0 \quad \text{Linear equation}$$

$$ax + b > 0, a \neq 0 \quad \text{Linear inequality}$$

NOTE This relationship is used again in the next chapter to define quadratic functions, equations, and inequalities.

Properties of Inequalities

Let a , b , and c be real numbers.

1. $a < b$ and $a + c < b + c$ are equivalent.
(The same number may be added to or subtracted from each side of an inequality.)
2. If $c > 0$, then $a < b$ and $ac < bc$ are equivalent.
(Each side of an inequality may be multiplied or divided by the same positive number.)
3. If $c < 0$, then $a < b$ and $ac > bc$ are equivalent.
(Each side of an inequality may be multiplied or divided by the same negative number provided the inequality symbol is reversed.)

Replacing $<$ with \leq and $>$ with \geq results in similar properties.

The following examples illustrate each property.

Property 1: To solve $x - 5 < 6$, add 5 to each side to obtain $x < 11$.

Property 2: To solve $5x < 10$, divide each side by 5 to obtain $x < 2$.

Property 3: To solve $-5x < 10$, divide each side by -5 to obtain $x > -2$. (Whenever you multiply or divide an inequality by a negative number, reverse the inequality symbol.)

Review of Interval Notation In Section 1.5 interval notation was introduced as an efficient way to express intervals on the real number line. For example, the interval $3 \leq x \leq 5$ is written as $[3, 5]$, whereas the interval $3 < x < 5$ is written as $(3, 5)$. A bracket, $[$ or $]$, is used when an endpoint is included, and a parenthesis, $($ or $)$, is used when an endpoint is not included. The interval $x \geq 2$ is written as $[2, \infty)$, where ∞ denotes infinity, and the interval $x < 2$ is written as $(-\infty, 2)$.

In the next example we solve linear equalities and express the solution set in both set-builder and interval notation.

EXAMPLE 1 Solving linear inequalities symbolically

Solve each inequality. Write the solution set in set-builder and interval notation.

(a) $2x - 3 < \frac{x + 2}{-3}$ (b) $-3(4z - 4) \geq 4 - (z - 1)$

SOLUTION

- (a) Use Property 3 by multiplying each side by -3 to clear fractions. Remember to reverse the inequality symbol when multiplying by a negative number.

$$\begin{array}{ll}
 2x - 3 < \frac{x + 2}{-3} & \text{Given inequality} \\
 -6x + 9 > x + 2 & \text{Property 3: Multiply by } -3 \text{ and reverse the} \\
 & \text{inequality symbol.} \\
 9 > 7x + 2 & \text{Property 1: Add } 6x. \\
 7 > 7x & \text{Property 1: Add } -2 \text{ (or subtract 2).} \\
 1 > x & \text{Property 2: Divide by 7.}
 \end{array}$$

In set-builder notation the solution set is $\{x | x < 1\}$, and in interval notation it is written as $(-\infty, 1)$.

- (b) Begin by applying the distributive property.

$$\begin{array}{ll}
 -3(4z - 4) \geq 4 - (z - 1) & \text{Given inequality} \\
 -12z + 12 \geq 4 - z + 1 & \text{Distributive property} \\
 -12z + 12 \geq -z + 5 & \text{Simplify.} \\
 -12z + z \geq 5 - 12 & \text{Property 1: Add } z \text{ and } -12. \\
 -11z \geq -7 & \text{Simplify.} \\
 z \leq \frac{7}{11} & \text{Property 3: Divide by } -11 \text{ and reverse} \\
 & \text{inequality symbol.}
 \end{array}$$

In set-builder notation the solution set is $\{z | z \leq \frac{7}{11}\}$, and in interval notation it is written as $(-\infty, \frac{7}{11}]$.

Now Try Exercises 15 and 17 ◀

Figure 2.44 Velocities of Two Cars

Graphical Solutions The intersection-of-graphs method can be extended to solve inequalities. Figure 2.44 shows the velocity of two cars in miles per hour after x minutes. V_A denotes the velocity of car A, and V_B denotes the velocity of car B. The domains of V_A and V_B are both assumed to be $0 \leq x \leq 6$.

At 3 minutes $V_A = V_B$, and both cars are traveling at 30 miles per hour. To the left of $x = 3$ the graph of V_A is below the graph of V_B , so car A is traveling slower than car B. Thus

$$V_A < V_B \quad \text{when} \quad 0 \leq x < 3.$$

To the right of $x = 3$ the graph of V_A is above the graph of V_B , so car A is traveling faster than car B. Thus

$$V_A > V_B \quad \text{when} \quad 3 < x \leq 6.$$

This technique is used in the next example.

EXAMPLE 3 Solving a linear inequality graphically

Graph $y_1 = \frac{1}{2}x + 2$ and $y_2 = 2x - 1$ by hand. Use the graph to solve the linear inequality $\frac{1}{2}x + 2 > 2x - 1$.

Figure 2.45

SOLUTION The graphs of $y_1 = \frac{1}{2}x + 2$ and $y_2 = 2x - 1$ are shown in Figure 2.45. The graphs intersect at the point $(2, 3)$. The graph of $y_1 = \frac{1}{2}x + 2$ is above the graph of $y_2 = 2x - 1$ to the left of the point of intersection, or when $x < 2$. Thus the solution set to the inequality $\frac{1}{2}x + 2 > 2x - 1$ is $\{x | x < 2\}$, or $(-\infty, 2)$.

Now Try Exercise 39

An Application In the next example we use graphical techniques to solve an application from meteorology.

EXAMPLE 1 Using the intersection-of-graphs method

When the air temperature reaches the dew point, fog may form. This phenomenon also causes clouds to form. See Figure 2.46. Both the air temperature and the dew point often decrease at a constant rate as the altitude above ground level increases. If the ground-level Fahrenheit temperature and dew point are T_0 and D_0 , the air temperature can sometimes be approximated by $T(x) = T_0 - 19x$ and the dew point by $D(x) = D_0 - 5.8x$ at an altitude of x miles.

- (a) If $T_0 = 75^\circ\text{F}$ and $D_0 = 55^\circ\text{F}$, determine the altitudes where clouds will not form.
 (b) The slopes of the graphs for the functions T and D are called *lapse rates*. Interpret their meanings. Explain how these two slopes ensure a strong likelihood of clouds forming. (Source: A. Miller and R. Anthes, *Meteorology*.)

SOLUTION

- (a) Since $T_0 = 75$ and $D_0 = 55$, let $T(x) = 75 - 19x$ and $D(x) = 55 - 5.8x$. Clouds will not form when the air temperature is greater than the dew point. Therefore we must solve the inequality $T(x) > D(x)$. Graph $T = 75 - 19x$ and $D = 55 - 5.8x$, as shown in Figure 2.47. The graphs intersect near $(1.52, 46.2)$. This means that the air temperature and dew point are both 46.2°F at about 1.52 miles above ground level. Clouds will not form below this altitude, or when the graph of T is above the graph of D . The solution set is $\{x | 0 \leq x < 1.52\}$, where the endpoint 1.52 has been approximated.

$[0, 5, 1]$ by $[0, 80, 10]$

Figure 2.47

- (b) The slope of the graph of T is -19 . This means that for each 1-mile increase in altitude, the air temperature *decreases* by 19°F . Similarly, the slope of the graph of D is -5.8 . The dew point *decreases* by 5.8°F for every 1-mile increase in altitude. As the altitude increases, the air temperature decreases at a faster rate than the dew point. As a result, the air temperature typically cools to the dew point at higher altitudes and clouds may form.

Now Try Exercise 85

CLASS DISCUSSION

How does the difference between the air temperature and the dew point at ground level affect the altitude at which clouds may form? Explain.

x-Intercept Method If a linear inequality can be written as $y_1 > 0$, where $>$ may be replaced by \geq , \leq , or $<$, then we can solve this inequality by using the **x-intercept method**. To apply this method for $y_1 > 0$, graph y_1 and find the x-intercept. The solution set includes x-values where the graph of y_1 is **above** the x-axis.

EXAMPLE 4 Applying the x -intercept method

Solve the inequality $1 - x > \frac{1}{2}x - 2$ by using the x -intercept method. Write the solution set in set-builder and interval notation. Then solve the inequality symbolically.

SOLUTION

Graphical Solution Start by subtracting $\frac{1}{2}x - 2$ from each side to obtain the inequality $1 - x - (\frac{1}{2}x - 2) > 0$. Then graph $Y_1 = 1 - X - (\frac{1}{2}X - 2)$, as shown in Figure 2.48, where the x -intercept is 2. The graph of y_1 is above the x -axis when $x < 2$. Therefore the solution set to $y_1 > 0$ is $\{x | x < 2\}$, or $(-\infty, 2)$.

Symbolic Solution	$1 - x > \frac{1}{2}x - 2$	Given inequality
	$-x > \frac{1}{2}x - 3$	Subtract 1 from each side.
	$-\frac{3}{2}x > -3$	Subtract $\frac{1}{2}x$ from each side.
	$x < 2$	Multiply by $-\frac{2}{3}$; reverse inequality.

The solution set is $\{x | x < 2\}$, or $(-\infty, 2)$.

Now Try Exercise 51 ◀

$[-6, 6, 1]$ by $[-4, 4, 1]$

Figure 2.48

Calculator Help

To locate a zero or x -intercept on the graph of a function, see Appendix A (page AP-9).

Visualizing Solutions Example 4 suggests a general result about linear inequalities. The graph of the equation $y = ax + b$, $a \neq 0$, is a line that intersects the x -axis once and slopes either upward (if $a > 0$) or downward (if $a < 0$). If the x -intercept is k , then the solution set to $ax + b > 0$ satisfies either $x > k$ or $x < k$, as illustrated in Figures 2.49 and 2.50. (Similar remarks hold for linear inequalities that use the symbol $<$, \leq , or \geq .) Note that the solution to $ax + b = 0$ is k and the value of k is that *boundary* between *greater than* and *less than* in either situation.

Solutions to $ax + b > 0$ satisfy $x > k$ when $a > 0$.

Figure 2.49

Solutions to $ax + b > 0$ satisfy $x < k$ when $a < 0$.

Figure 2.50

Numerical Solutions Inequalities can sometimes be solved by using a table of values. The following example helps to explain the mathematical concept behind this method.

Suppose that it costs a company $5x + 200$ dollars to produce x pairs of headphones and the company receives $15x$ dollars for selling x pairs of headphones. Then the profit P from selling x pairs of headphones is $P = 15x - (5x + 200) = 10x - 200$. A value of $x = 20$ results in $P = 0$, and so $x = 20$ is called the **boundary number** because it represents

the boundary between making money and losing money (the break-even point). To make money, the profit P must be positive, and the inequality

$$10x - 200 > 0$$

must be satisfied. The table of values for $y_1 = 10x - 200$ in Table 2.8 shows the boundary number $x = 20$ along with several **test values**. The test values of $x = 17, 18$, and 19 result in a loss. The test values of $x = 21, 22$, and 23 result in a profit. Therefore the solution set to $10x - 200 > 0$ is $\{x | x > 20\}$.

Table 2.8

x	17	18	19	20	21	22	23

Less than 0
Greater than 0

Boundary number

EXAMPLE 1 Solving a linear inequality with test values

Solve $3(6 - x) + 5 - 2x < 0$ numerically.

SOLUTION We begin by making a table of $Y_1 = 3(6 - X) + 5 - 2X$, as shown in Figure 2.51. We can see that the boundary number for this inequality lies between $x = 4$ and $x = 5$. Changing the increment from 1 to 0.1 in Figure 2.52 shows that the boundary number for the inequality is $x = 4.6$. The test values of $x = 4.7, 4.8$, and 4.9 indicate that when $x > 4.6$, the inequality $y_1 < 0$ is true. The solution set is $\{x | x > 4.6\}$.

X	Y ₁	
1	18	Greater than 0
2	13

Figure 2.52

Now Try Exercise 71

MAKING CONNECTIONS

Symbolic, Graphical, and Numerical Solutions Linear inequalities can be solved symbolically, graphically, or numerically. Each method is used in the following example to solve the inequality $3 - (x + 2) > 0$.

Symbolic Solution

$$\begin{aligned}
 3 - (x + 2) &> 0 \\
 -(x + 2) &> -3 \\
 x + 2 &< 3 \\
 x &< 1
 \end{aligned}$$

Graphical Solution

The graph of $y = 3 - (x + 2)$ is above the x -axis when $x < 1$.

Numerical Solution

x	$3 - (x + 2)$	
-2	3	Greater than 0
-1	2	
0	1	
1	0	Equal 0
2	-1	Less
3	-2	

The values of $3 - (x + 2)$ are greater than 0 when $x < 1$.

Compound Inequalities

Sometimes a variable must satisfy two inequalities. For example, on a freeway there may be a minimum speed limit of 40 miles per hour and a maximum speed limit of 70 miles per hour. If x represents the speed of a vehicle, then x must satisfy the compound inequality

$$x \geq 40 \quad \text{and} \quad x \leq 70.$$

A **compound inequality** occurs when two inequalities are connected by the word *and* or *or*. When the word *and* connects two inequalities, the two inequalities can sometimes be written as a **three-part inequality**. For example, the previous compound inequality may be written as the three-part inequality

$$40 \leq x \leq 70.$$

Compound inequalities involving the word *or* are discussed in the next section.

EXAMPLE 6 Solving a three-part inequality symbolically

Solve the inequality. Write the solution set in set-builder and interval notation.

(a) $-4 \leq 5x + 1 < 21$ (b) $\frac{1}{2} < \frac{1 - 2t}{4} < 2$

SOLUTION

(a) Use properties of inequalities to simplify the three-part inequality.

$$\begin{array}{ll} -4 \leq 5x + 1 < 21 & \text{Given inequality} \\ -5 \leq 5x < 20 & \text{Add } -1 \text{ to each part.} \\ -1 \leq x < 4 & \text{Divide each part by 5.} \end{array}$$

The solution set is $\{x \mid -1 \leq x < 4\}$, or $[-1, 4)$.

(b) Begin by multiplying each part by 4 to clear fractions.

$$\begin{array}{ll} \frac{1}{2} < \frac{1 - 2t}{4} < 2 & \text{Given inequality} \\ 2 < 1 - 2t < 8 & \text{Multiply each part by 4.} \\ 1 < -2t < 7 & \text{Add } -1 \text{ to each part.} \\ -\frac{1}{2} > t > -\frac{7}{2} & \text{Divide by } -2; \text{ reverse inequalities.} \\ -\frac{7}{2} < t < -\frac{1}{2} & \text{Rewrite the inequality.} \end{array}$$

The solution set is $\{t \mid -\frac{7}{2} < t < -\frac{1}{2}\}$, or $(-\frac{7}{2}, -\frac{1}{2})$.

Now Try Exercises 23 and 35

NOTE In Example 6, it is correct to write a three-part inequality as either $-\frac{1}{2} > t > -\frac{7}{2}$ or $-\frac{7}{2} < t < -\frac{1}{2}$. However, we usually write the smaller number on the left side and the larger number on the right side.

Three-part inequalities occur in many applications and can often be solved symbolically and graphically. This is demonstrated in the next example.

**EXAMPLE 7** Modeling sunset times

In Boston, on the 82nd day (March 22) of 2008 the sun set at 7:00 P.M., and on the 136th day (May 15) the sun set at 8:00 P.M. Use a linear function S to estimate the days when the sun set between 7:15 P.M. and 7:45 P.M., inclusive. Do not consider any days of the year after May 15. (Source: R. Thomas, *The Old Farmer's 2008 Almanac*.)

SOLUTION

Getting Started First, find a linear function S whose graph passes through the points $(82, 7)$ and $(136, 8)$. Then solve the compound inequality $7.25 \leq S(x) \leq 7.75$. Note that 7.25 hours past noon corresponds to 7:15 P.M. and 7.75 hours past noon corresponds to 7:45 P.M. ▶

Symbolic Solution The slope of the line passing through $(82, 7)$ and $(136, 8)$ is given by $\frac{8-7}{136-82} = \frac{1}{54}$. The point-slope form of the line passing through $(82, 7)$ with slope $\frac{1}{54}$ is

$$S(x) = \frac{1}{54}(x - 82) + 7, \quad \text{Point-slope form}$$

Now solve the following compound inequality.

$$7.25 \leq \frac{1}{54}(x - 82) + 7 \leq 7.75 \quad \text{Given inequality}$$

$$0.25 \leq \frac{1}{54}(x - 82) \leq 0.75 \quad \text{Subtract 7 from each part.}$$

$$13.5 \leq x - 82 \leq 40.5 \quad \text{Multiply each part by 54.}$$

$$95.5 \leq x \leq 122.5 \quad \text{Add 82 to each part.}$$

If we round 95.5 and 122.5 up to 96 and 123, then this model predicts that the sun set between 7:15 P.M. and 7:45 P.M. from the 96th day (April 5) to the 123rd day (May 2). (Note that the actual days were April 5 and May 1.)

Graphical Solution Graph $y_1 = 7.25$, $y_2 = \frac{1}{54}(x - 82) + 7$, and $y_3 = 7.75$ and determine their points of intersection, $(95.5, 7.25)$ and $(122.5, 7.75)$, as shown in Figures 2.53 and 2.54. The graph of y_2 is between the graphs of y_1 and y_3 for $95.5 \leq x \leq 122.5$. This agrees with the symbolic solution. A different graph showing this solution appears in Figure 2.55.

[80, 150, 10] by [6.5, 8.5, 1]

Figure 2.53

Figure 2.55

Now Try Exercise 93

EXAMPLE 6 Solving inequalities symbolically

Solve the linear inequalities symbolically. Express the solution set using interval notation.

(a) $-\frac{x}{2} + 1 \leq 3$ (b) $-8 < \frac{3x - 1}{2} \leq 5$ (c) $5(x - 6) < 2x - 2(1 - x)$

SOLUTION

(a) Simplify the inequality as follows.

$$\begin{aligned} -\frac{x}{2} + 1 &\leq 3 && \text{Given inequality} \\ -\frac{x}{2} &\leq 2 && \text{Add } -1, \text{ or subtract } 1. \\ x &\geq -4 && \text{Multiply by } -2. \text{ Reverse the inequality.} \end{aligned}$$

In interval notation the solution set is $[-4, \infty)$.

(b) The parts of this compound inequality can be solved simultaneously.

$$\begin{aligned} -8 &< \frac{3x - 1}{2} \leq 5 && \text{Given inequality} \\ -16 &< 3x - 1 \leq 10 && \text{Multiply by } 2. \\ -15 &< 3x \leq 11 && \text{Add } 1. \\ -5 &< x \leq \frac{11}{3} && \text{Divide by } 3. \end{aligned}$$

The solution set is $(-5, \frac{11}{3}]$.

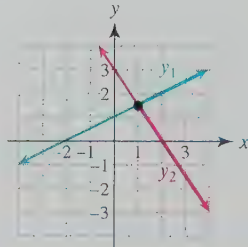

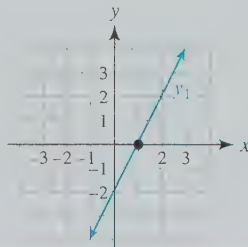

(c) Start by applying the distributive property to each side of the inequality.

$$\begin{aligned} 5(x - 6) &< 2x - 2(1 - x) && \text{Given inequality} \\ 5x - 30 &< 2x - 2 + 2x && \text{Distributive property} \\ 5x - 30 &< 4x - 2 && \text{Simplify.} \\ x - 30 &< -2 && \text{Subtract } 4x. \\ x &< 28 && \text{Add } 30. \end{aligned}$$

The solution set is $(-\infty, 28)$.**Now Try Exercises 13, 27, and 33** ◀**2.4 Putting It All Together**

Any linear inequality can be written as $ax + b > 0$ with $a \neq 0$, where $>$ can be replaced by \geq , $<$, or \leq . The following table includes methods for solving linear inequalities in the form $h(x) > 0$ or $f(x) > g(x)$. Inequalities involving $<$, \leq , and \geq are solved in a similar manner.

Concept	Explanation	Examples
Interval notation	An efficient notation for writing the solution set to inequalities To review interval notation, see Section 1.5.	$x < 2$ is equivalent to $(-\infty, 2)$. $x \geq 1$ is equivalent to $[1, \infty)$. $-1 \leq x < 4$ is equivalent to $[-1, 4)$.

Concept	Explanation	Examples												
Compound inequality	Two inequalities connected by the word <i>and</i> or <i>or</i>	$x \leq 4$ or $x \geq 10$ $x \geq -3$ and $x < 4$ $x > 5$ and $x \leq 20$ can be written as the three-part inequality $5 < x \leq 20$.												
Symbolic method	Use properties of inequalities to simplify $f(x) > g(x)$ to either $x > k$ or $x < k$ for some real number k .	$\frac{1}{2}x + 1 > 3 - \frac{3}{2}x$ <i>Given inequality</i> $2x + 1 > 3$ <i>Add $\frac{3}{2}x$.</i> $2x > 2$ <i>Subtract 1.</i> $x > 1$ <i>Divide by 2.</i>												
Intersection-of-graphs method	To solve $f(x) > g(x)$, graph $y_1 = f(x)$ and $y_2 = g(x)$. Find the point of intersection. The solution set includes x -values where the graph of y_1 is above the graph of y_2 .	$\frac{1}{2}x + 1 > 3 - \frac{3}{2}x$ Graph $y_1 = \frac{1}{2}x + 1$ and $y_2 = 3 - \frac{3}{2}x$. The solution set for $y_1 > y_2$ is $\{x x > 1\}$. 												
The x -intercept method	Write the inequality as $h(x) > 0$. Graph $y_1 = h(x)$. Solutions occur where the graph is above the x -axis.	$\frac{1}{2}x + 1 > 3 - \frac{3}{2}x$ Graph $y_1 = \frac{1}{2}x + 1 - (3 - \frac{3}{2}x)$. The solution set for $y_1 > 0$ is $\{x x > 1\}$. 												
Numerical method	Write the inequality as $h(x) > 0$. Create a table for $y_1 = h(x)$ and find the boundary number $x = k$ such that $h(k) = 0$. Use the test values in the table to determine if the solution set is $x > k$ or $x < k$.	$\frac{1}{2}x + 1 > 3 - \frac{3}{2}x$ Table $y_1 = \frac{1}{2}x + 1 - (3 - \frac{3}{2}x)$. The solution set for $y_1 > 0$ is $\{x x > 1\}$. <table><tr><td>x</td><td>-1</td><td>0</td><td>1</td><td>2</td><td>3</td></tr><tr><td>y_1</td><td>-4</td><td>-2</td><td>0</td><td>2</td><td>4</td></tr></table> <p style="text-align: center;">Less than 0Greater than 0</p>	x	-1	0	1	2	3	y_1	-4	-2	0	2	4

6. $\{x \mid -2 < x \leq 4\}$
7. $\{x \mid x \leq 1\}$
8. $\{x \mid x > 5\}$

Solving Linear Inequalities Symbolically

Exercises 9–38: Solve the inequality symbolically. Express the solution set in set-builder or interval notation.

9. $2x + 6 \geq 10$
10. $-4x - 3 < 5$
11. $-2(x - 10) + 1 > 0$
12. $3(x + 5) \leq 0$
13. $\frac{t + 2}{3} \geq 5$
14. $\frac{2 - t}{6} < 0$
15. $4x - 1 < \frac{3 - x}{-3}$
16. $\frac{x + 5}{-10} > 2x + 3$
17. $-3(z - 4) \geq 2(1 - 2z)$
18. $-\frac{1}{4}(2z - 6) + z \geq 5$
19. $\frac{1 - x}{4} < \frac{2x - 2}{3}$
20. $\frac{3x}{4} < x - \frac{x + 2}{2}$
21. $2x - 3 > \frac{1}{2}(x + 1)$
22. $5 - (2 - 3x) \leq -5x$
23. $5 < 4t - 1 \leq 11$
24. $-1 \leq 2t \leq 4$
25. $3 \leq 4 - x \leq 20$
26. $-5 < 1 - 2x < 40$
27. $-7 \leq \frac{1 - 4x}{7} < 12$
28. $0 < \frac{7x - 5}{3} \leq 4$
29. $5 > 2(x + 4) - 5 > -5$
30. $\frac{8}{3} \geq \frac{4}{3} - (x + 3) \geq \frac{2}{3}$
31. $3 \leq \frac{1}{2}x + \frac{3}{4} \leq 6$
32. $-4 \leq 5 - \frac{4}{5}x < 6$
33. $5x - 2(x + 3) \geq 4 - 3x$
34. $3x - 1 < 2(x - 3) + 1$

$$35. \frac{1}{2} \leq \frac{1 - 2t}{3} < \frac{2}{3} \quad 36. -\frac{3}{4} < \frac{2 - t}{5} < \frac{3}{4}$$

$$37. \frac{1}{2}z + \frac{2}{3}(3 - z) - \frac{5}{4}z \geq \frac{3}{4}(z - 2) + z$$

$$38. \frac{2}{3}(1 - 2z) - \frac{3}{2}z + \frac{5}{6}z \geq \frac{2z - 1}{3} + 1$$

Solving Linear Inequalities Graphically

Exercises 39–46: (Refer to Example 2.) Solve the inequality graphically. Use set-builder notation.

39. $x + 2 \geq 2x$
40. $2x - 1 \leq x$
41. $\frac{2}{3}x - 2 > -\frac{4}{3}x + 4$
42. $-2x \geq -\frac{5}{3}x + 1$
43. $-1 \leq 2x - 1 \leq 3$
44. $-2 < 1 - x < 2$
45. $-3 < x - 2 \leq 2$
46. $-1 \leq 1 - 2x < 5$

Exercises 47–50: Use the given graph of $y = ax + b$ to solve each equation and inequality. Write the solution set to each inequality in set-builder or interval notation.

(a) $ax + b = 0$ (b) $ax + b < 0$ (c) $ax + b \geq 0$

47.

48.

49.

50.

Exercises 51–54: *x*-Intercept Method (Refer to Example 4.) Use the *x*-intercept method to solve the inequality. Write the solution set in set-builder or interval notation. Then solve the inequality symbolically.

51. $x - 3 \leq \frac{1}{2}x - 2$

52. $x - 2 \leq \frac{1}{3}x$

53. $2 - x < 3x - 2$

54. $\frac{1}{2}x + 1 > \frac{3}{2}x - 1$

Exercises 55–60: Solve the linear inequality graphically. Write the solution set in set-builder notation. Approximate endpoints to the nearest hundredth whenever appropriate.

55. $5x - 4 > 10$

56. $-3x + 6 \leq 9$

57. $-2(x - 1990) + 55 \geq 60$

58. $\sqrt{2}x > 10.5 - 13.7x$

59. $\sqrt{5}(x - 1.2) - \sqrt{3}x < 5(x + 1.1)$

60. $1.238x + 0.998 \leq 1.23(3.987 - 2.1x)$

Exercises 61–66: Solve the compound linear inequality graphically. Write the solution set in set-builder or interval notation, and approximate endpoints to the nearest tenth whenever appropriate.

61. $3 \leq 5x - 17 < 15$

62. $-4 < \frac{55 - 3.1x}{4} < 17$

63. $1.5 \leq 9.1 - 0.5x \leq 6.8$

64. $0.2x < \frac{2x - 5}{3} < 8$

65. $x - 4 < 2x - 5 < 6$

66. $-3 \leq 1 - x \leq 2x$

67. The graphs of two linear functions f and g are shown.

(a) Solve the equation $g(x) = f(x)$.

(b) Solve the inequality $g(x) > f(x)$.

68. Use the figure to solve each equation or inequality.

(a) $f(x) = g(x)$

(b) $g(x) = h(x)$

(c) $f(x) < g(x) < h(x)$

(d) $g(x) > h(x)$

Solving Linear Inequalities Numerically

Exercises 69 and 70: Assume y_1 represents a linear function with the set of real numbers for its domain. Use the table to solve the inequalities. Use set-builder notation.

69. $y_1 > 0, y_1 \leq 0$

70. $y_1 < 0, y_1 \geq 0$

X	Y_1
0	220
1	165
2	110
3	55
4	0
5	-55
6	-110

$X = 0$

X	Y_1
-5	-32
-4	-16
-3	0
-2	16
-1	32
0	48
1	64

$X = -5$

Exercises 71–78: Solve each inequality numerically. Write the solution set in set-builder or interval notation, and approximate endpoints to the nearest tenth when appropriate.

71. $-4x - 6 > 0$

72. $1 - 2x \geq 9$

73. $1 \leq 3x - 2 \leq 10$

74. $-5 < 2x - 1 < 15$

75. $-\frac{3}{4} < \frac{2 - 5x}{3} \leq \frac{3}{4}$

76. $\frac{3x - 1}{5} < 15$

77. $(\sqrt{11} - \pi)x - 5.5 \leq 0$

78. $1.5(x - 0.7) + 1.5x < 1$

You Decide the Method

Exercises 79–82: Solve the inequality. Approximate the endpoints to the nearest thousandth when appropriate.

79. $2x - 8 > 5$

80. $5 < 4x - 2.5$

81. $\pi x - 5.12 \leq \sqrt{2}x - 5.7(x - 1.1)$

82. $5.1x - \pi \geq \sqrt{3} - 1.7x$

Applications

83. **Distance between Cars** Cars A and B are both traveling in the same direction. Their distances in miles north of St. Louis after x hours are computed by the functions f_A and f_B , respectively. The graphs of f_A and f_B are shown in the figure for $0 \leq x \leq 10$.

- (a) Which car is traveling faster? Explain.
- (b) How many hours elapse before the two cars are the same distance from St. Louis? How far are they from St. Louis when this occurs?
- (c) During what time interval is car B farther from St. Louis than car A?

84. **Distance** Function f computes the distance y in miles between a car and the city of Omaha after x hours, where $0 \leq x \leq 6$. The graphs of f and the horizontal lines $y = 100$ and $y = 200$ are shown in the figure.

- (a) Is the car moving toward or away from Omaha? Explain.
- (b) Determine the times when the car is 100 miles and 200 miles from Omaha.
- (c) Determine when the car is from 100 to 200 miles from Omaha.
- (d) When is the car's distance from Omaha greater than 100 miles?

85. **Clouds and Temperature** (Refer to Example 3.) Suppose the ground-level temperature is 65°F and the dew point is 50°F .

(a) Use the intersection-of-graphs method to estimate the altitudes where clouds will not form.

(b) Solve part (a) symbolically.

86. **Temperature and Altitude** Suppose the Fahrenheit temperature x miles above ground level is given by the formula $T(x) = 85 - 19x$.

(a) Use the intersection-of-graphs method to estimate the altitudes where the temperature is below freezing. Assume that the domain of T is $0 \leq x \leq 6$.

(b) What does the x -intercept on the graph of $y = T(x)$ represent?

(c) Solve part (a) symbolically.

87. **Prices of Homes** The median prices of a single-family home in the United States from 1990 to 2005 can be approximated by the formula $P(x) = 8667x + 90,000$, where $x = 0$ corresponds to 1990 and $x = 15$ to 2005. (Source: National Association of Realtors.)

(a) Interpret the slope of the graph of P .

(b) Estimate the years when the median price range was from \$142,000 to \$194,000.

88. **Population Density** The population density D of the United States in people per square mile during year x from 1900 to 2000 can be approximated by the formula $D(x) = 0.58x - 1080$. (Source: Bureau of the Census.)

(a) Interpret the slope of the graph of D .

(b) Estimate when the density varied between 50 and 75 people per square mile.

89. **Broadband Internet Connections** The number of households using broadband Internet connections, such as cable and DSL, increased from 6 million in 2000 to 30 million in 2004. (Source: eMarketer.)

(a) Find a linear function given by

$$B(x) = m(x - x_1) + y_1$$

that models these data, where x is the year.

(b) Use $B(x)$ to estimate the years when the number of households using broadband Internet connections was 24 million or more. Assume that the domain of B is 2000 to 2006.

90. **Online Betting** Consumer gambling losses from online betting were \$4 billion in 2002 and \$10 billion in 2005. (Source: Christiansen Capital Advisors.)

(a) Find a linear function given by

$$B(x) = m(x - x_1) + y_1$$

that models these data, where x is the year.

(b) Use $B(x)$ to estimate the years when consumer losses from online betting were more than \$6 billion. Assume that the domain of B is 2002 to 2007.

91. **Consumer Spending** In 2005 consumers used credit and debit cards to pay for 40% of all purchases. This percentage is projected to be 55% in 2011. (Source: Bloomberg.)

(a) Find a linear function P that models the data.

(b) Estimate when this percentage was between 45% and 50%.

92. **VISA Cards** Annual transactions on VISA cards increased from \$400 billion in 2002 to \$635 billion in 2007. (Source: CardWeb.)

(a) Find a linear function V that models the data.

(b) Estimate when this number was between \$450 billion and \$540 billion.

93. **Modeling Sunrise Times** In Boston, on the 90th day (March 30) of 2008 the sun rose at 6:30 A.M., and on the 129th day (May 8) the sun rose at 5:30 A.M. Use a linear function to estimate the days when the sun rose between 5:45 A.M. and 6:00 A.M. Do not consider days after May 8. (Source: R. Thomas.)

94. **Modeling Sunrise Times** In Denver, on the 77th day (March 17) of 2008 the sun rose at 7:00 A.M., and on the 112th day (April 21) the sun rose at 6:00 A.M. Use a linear function to estimate the days when the sun rose between 6:10 A.M. and 6:40 A.M. Do not consider days after April 21. (Source: R. Thomas.)

95. **Error Tolerances** Suppose that an aluminum can is manufactured so that its radius r can vary from 1.99 inches to 2.01 inches. What range of values is possible for the circumference C of the can? Express your answer by using a three-part inequality.

96. **Error Tolerances** Suppose that a square picture frame has sides that vary between 9.9 inches and 10.1 inches. What range of values is possible for the perimeter P of the picture frame? Express your answer by using a three-part inequality.

97. **Modeling Data** The following data are exactly linear.

x	0	2	4	6
y	-1.5	4.5	10.5	16.5

(a) Find a linear function f that models the data.

(b) Solve the inequality $f(x) > 2.25$.

98. **Modeling Data** The following data are exactly linear.

x	1	2	3	4	5
y	0.4	3.5	6.6	9.7	12.8

(a) Find a linear function f that models the data.

(b) Solve the inequality $2 \leq f(x) \leq 8$.

Linear Regression

99. **Cell Phone Subscribers** The table lists the number N of cell phone subscribers worldwide in millions for selected years x .

x	2001	2002	2003	2004	2005
N	128	141	159	182	208

Source: CTIA—The Wireless Association.

(a) Find a linear function N that models the data.

(b) Estimate the years when this number was from 43 million to 83 million.

(c) Did your estimate involve interpolation or extrapolation?

100. **Home Ownership Rates** The table lists the percentage P of U.S. homes that are owned by their occupant rather than rented for selected years x .

x	1900	1950	1980	2006
P	47%	55%	64%	69%

Source: Bureau of the Census.

(a) Find a linear function P that models the data.

(b) Estimate the years when this percentage was from 58% to 60%.

(c) Did your estimate involve interpolation or extrapolation?

Writing about Mathematics

101. Suppose the solution to the equation $ax + b = 0$ with $a > 0$ is $x = k$. Discuss how the value of k can be used to help solve the linear inequalities $ax + b > 0$ and $ax + b < 0$. Illustrate this process graphically. How would the solution sets change if $a < 0$?
102. Describe how to numerically solve the linear inequality $ax + b \leq 0$. Give an example.
103. If you multiply each part of a three-part inequality by the same negative number, what must you make sure to do? Explain by using an example.

104. Explain how a linear function, a linear equation, and a linear inequality are related. Give an example.

EXTENDED AND DISCOVERY EXERCISES

1. **Arithmetic Mean** The arithmetic mean of two numbers a and b is given by $\frac{a+b}{2}$. Use properties of inequalities to show that if $a < b$, then $a < \frac{a+b}{2} < b$.
2. **Geometric Mean** The geometric mean of two numbers a and b is given by \sqrt{ab} . Use properties of inequalities to show that if $0 < a < b$, then $a < \sqrt{ab} < b$.

CHECKING BASIC CONCEPTS FOR SECTIONS 2.3 AND 2.4

1. Solve the linear equation $4(x - 2) = 2(5 - x) - 3$ by using each method. Compare your results.
(a) Graphical (b) Numerical (c) Symbolic
2. Solve the inequality $2(x - 4) > 1 - x$. Express the solution set in set-builder notation.
3. Solve the compound inequality $-2 \leq 1 - 2x \leq 3$. Use set-builder or interval notation.
4. Use the graph to the right to solve each equation and inequality. Then solve each part symbolically. Use set-builder or interval notation when possible.
(a) $-3(2 - x) - \frac{1}{2}x - \frac{3}{2} = 0$

(b) $-3(2 - x) - \frac{1}{2}x - \frac{3}{2} > 0$

(c) $-3(2 - x) - \frac{1}{2}x - \frac{3}{2} \leq 0$

2.5 Absolute Value Equations and Inequalities

- Evaluate and graph the absolute value function
- Solve absolute value equations
- Solve absolute value inequalities

Introduction

A margin of error can be very important in many aspects of life, including being fired out of a cannon. The most dangerous part of the feat, first done by a human in 1875, is to land squarely on a net. For a human cannonball who wants to fly 180 feet in the air and then land in the center of a net with a 60-foot-long safe zone, there is a margin of error of ± 30 feet. That is, the horizontal distance D traveled by the human cannonball can vary between $180 - 30 = 150$ feet and $180 + 30 = 210$ feet. (Source: Ontario Science Center.)

This margin of error can be expressed mathematically by using the *absolute value inequality*

$$|D - 180| \leq 30.$$

The absolute value is necessary because D can be either less than or greater than 180, but by not more than 30 feet.

The Absolute Value Function

Figure 2.56 The Absolute Value Function

The graph of $y = |x|$ is shown in Figure 2.56. It is V-shaped and cannot be represented by a single linear function. However, it can be represented by the lines $y = x$ (when $x \geq 0$) and $y = -x$ (when $x < 0$). This suggests that the absolute value function can be defined symbolically using a piecewise-linear function. The absolute value function is decreasing for $x \leq 0$ and increasing for $x \geq 0$.

$$|x| = \begin{cases} -x & \text{if } x < 0 \\ x & \text{if } x \geq 0 \end{cases}$$

There is another formula for $|x|$. Consider the following examples.

$$\sqrt{3^2} = \sqrt{9} = 3 \quad \text{and} \quad \sqrt{(-3)^2} = \sqrt{9} = 3.$$

$$\sqrt{7^2} = \sqrt{49} = 7 \quad \text{and} \quad \sqrt{(-7)^2} = \sqrt{49} = 7.$$

That is, regardless of whether a real number x is positive or negative, the expression $\sqrt{x^2}$ equals the *absolute value* of x . This statement is summarized by

$$\sqrt{x^2} = |x| \quad \text{for all real numbers } x.$$

For example, $\sqrt{y^2} = |y|$, $\sqrt{(x-1)^2} = |x-1|$, and $\sqrt{(2x)^2} = |2x|$.

EXAMPLE 1

Analyzing the graph of $y = |ax + b|$

For each linear function f , graph $y = f(x)$ and $y = |f(x)|$ separately. Discuss how the absolute value affects the graph of f .

- (a) $f(x) = x + 2$ (b) $f(x) = -2x + 4$

SOLUTION

- (a) The graphs of $y_1 = x + 2$ and $y_2 = |x + 2|$ are shown in Figures 2.57 and 2.58, respectively. The graph of y_1 is a line with x -intercept -2 . The graph of y_2 is V-shaped. The graphs are identical for $x > -2$. For $x < -2$, the graph of $y_1 = f(x)$ passes below the x -axis, and the graph of $y_2 = |f(x)|$ is the *reflection* of $y_1 = f(x)$ across the x -axis. The graph of $y_2 = |f(x)|$ does not dip below the x -axis because an absolute value is *never* negative.

Figure 2.57

Figure 2.58

NOTE In general, the graph of $y = |f(x)|$ is a reflection of the graph of $y = f(x)$ across the x -axis whenever $f(x) < 0$. Otherwise (whenever $f(x) \geq 0$), their graphs are identical.

Calculator Help

To access the absolute value function, see Appendix A (page AP-10).

- (b) The graphs of $y_1 = -2x + 4$ and $y_2 = |-2x + 4|$ are shown in Figures 2.59 and 2.60. Again, the graph of y_2 is V-shaped. The graph of $y_2 = |f(x)|$ is the reflection of f across the x -axis whenever the graph of $y_1 = f(x)$ is below the x -axis.

Figure 2.59

Figure 2.60

Now Try Exercises 13 and 17 ◀

Example 1 illustrates the fact that the graph of $y = |ax + b|$ with $a \neq 0$ is V-shaped and is never located below the x -axis. The vertex (or point) of the V-shaped graph corresponds to the x -intercept, which can be found by solving the linear equation $ax + b = 0$.

Figure 2.61

Absolute Value Equations

The equation $|x| = 5$ has two solutions: ± 5 . This fact is shown visually in Figure 2.61, where the graph of $y = |x|$ intersects the horizontal line $y = 5$ at the points $(\pm 5, 5)$. In general, the solutions to $|x| = k$ with $k > 0$ are given by $x = \pm k$. Thus if $y = ax + b$, then $|ax + b| = k$ has two solutions given by $ax + b = \pm k$.

These concepts can be illustrated visually. The graph of $y = |ax + b|$ with $a \neq 0$ is V-shaped. It intersects the horizontal line $y = k$ twice whenever $k > 0$, as illustrated in Figure 2.62. Thus there are two solutions to the equation $|ax + b| = k$. This V-shaped graph intersects the line $y = 0$ once, as shown in Figure 2.63. As a result, equation $|ax + b| = 0$ has one solution, which corresponds to the x -intercept. When $k < 0$, the line $y = k$ lies below the x -axis and there are no points of intersection, as shown in Figure 2.64. Thus the equation $|ax + b| = k$ with $k < 0$ has no solutions.

Figure 2.62 Two Solutions

Figure 2.63 One Solution

Figure 2.64 No Solutions

Absolute Value Equations

Let k be a positive number. Then

$$|ax + b| = k \text{ is equivalent to } ax + b = \pm k.$$

EXAMPLE 2 Solving absolute value equations

Solve each equation.

(a) $|\frac{3}{4}x - 6| = 15$ (b) $|1 - 2x| = -3$ (c) $|3x - 2| - 5 = -2$

SOLUTION(a) The equation $|\frac{3}{4}x - 6| = 15$ is satisfied when $\frac{3}{4}x - 6 = \pm 15$.

$$\begin{array}{lll}
 \frac{3}{4}x - 6 = 15 & \text{or} & \frac{3}{4}x - 6 = -15 \\
 \frac{3}{4}x = 21 & \text{or} & \frac{3}{4}x = -9 \\
 x = 28 & \text{or} & x = -12
 \end{array}$$

Equations to solve
Add 6 to each side.
Multiply by $\frac{4}{3}$.

The solutions are -12 and 28 .(b) Because an absolute value is never negative, $|1 - 2x| \geq 0$ for all x and can never equal -3 . There are no solutions. This is illustrated graphically in Figure 2.65.

(c) Because the right side of the equation is a negative number, it might appear at first glance that there were no solutions. However, if we add 5 to each side of the equation,

$$|3x - 2| - 5 = -2 \quad \text{becomes} \quad |3x - 2| = 3.$$

This equation is equivalent to $3x - 2 = \pm 3$ and has two solutions.

$$\begin{array}{lll}
 3x - 2 = 3 & \text{or} & 3x - 2 = -3 \\
 3x = 5 & \text{or} & 3x = -1 \\
 x = \frac{5}{3} & \text{or} & x = -\frac{1}{3}
 \end{array}$$

Equations to solve
Add 2 to each side.
Divide by 3.

The solutions are $-\frac{1}{3}$ and $\frac{5}{3}$.

Now Try Exercises 21, 29, and 31

Figure 2.65 No Solutions

EXAMPLE 3 Solving an equation with technologySolve the equation $|2x + 5| = 2$ graphically, numerically, and symbolically.**SOLUTION****Graphical Solution** Graph $Y_1 = \text{abs}(2X + 5)$ and $Y_2 = 2$. The V-shaped graph of y_1 intersects the horizontal line at the points $(-3.5, 2)$ and $(-1.5, 2)$, as shown in Figures 2.66 and 2.67. The solutions are -3.5 and -1.5 .**Numerical Solution** Table $Y_1 = \text{abs}(2X + 5)$ and $Y_2 = 2$, as shown in Figure 2.68. The solutions to $y_1 = y_2$ are -3.5 and -1.5 .**Calculator Help**

To find a point of intersection, see Appendix A (page AP-8).

Figure 2.66

Figure 2.67

X	Y1	Y2

-3.5	2	2 ← $y_1 = y_2$
-3	1	2
-2.5	0	2
-2	1	2
-1.5	2	2 ← $y_1 = y_2$
-1	3	2

$Y1 = \text{abs}(2X + 5)$

Figure 2.68

Symbolic Solution The equation $|2x + 5| = 2$ is satisfied when $2x + 5 = \pm 2$.

$$\begin{array}{lll} 2x + 5 = 2 & \text{or} & 2x + 5 = -2 & \text{Equations to solve} \\ 2x = -3 & \text{or} & 2x = -7 & \text{Subtract 5 from each side.} \\ x = -\frac{3}{2} & \text{or} & x = -\frac{7}{2} & \text{Divide by 2.} \end{array}$$

Now Try Exercise 45 ◀

EXAMPLE 4 Describing speed limits with absolute values

The lawful speeds S on an interstate highway satisfy $|S - 55| \leq 15$. Find the maximum and minimum speed limits by solving the equation $|S - 55| = 15$.

SOLUTION The equation $|S - 55| = 15$ is equivalent to $S - 55 = \pm 15$.

$$\begin{array}{lll} S - 55 = 15 & \text{or} & S - 55 = -15 & \text{Equations to solve} \\ S = 70 & \text{or} & S = 40 & \text{Add 55 to each side.} \end{array}$$

The maximum speed limit is 70 miles per hour and the minimum is 40 miles per hour.

Now Try Exercise 73 ◀

An Equation with Two Absolute Values Sometimes more than one absolute value sign occurs in an equation. For example, an equation might be in the form

$$|ax + b| = |cx + d|.$$

In this case there are two possibilities:

$$\text{either } ax + b = cx + d \quad \text{or} \quad ax + b = -(cx + d).$$

This symbolic technique is demonstrated in the next example.

EXAMPLE 5 Solving an equation involving two absolute values

Solve the equation $|x - 2| = |1 - 2x|$.

SOLUTION We must solve both of the following equations.

$$\begin{array}{lll} x - 2 = 1 - 2x & \text{or} & x - 2 = -(1 - 2x) \\ 3x = 3 & \text{or} & x - 2 = -1 + 2x \\ x = 1 & \text{or} & -1 = x \end{array}$$

There are two solutions: -1 and 1 .

Now Try Exercise 35 ◀

Absolute Value Inequalities

In Figure 2.69 the solutions to $|ax + b| = k$ are labeled s_1 and s_2 . The V-shaped graph of $y = |ax + b|$ is below the horizontal line $y = k$ between s_1 and s_2 , or when $s_1 < x < s_2$. The solution set for the inequality $|ax + b| < k$ is green on the x -axis. In Figure 2.70 the V-shaped graph is above the horizontal line $y = k$ left of s_1 or right of s_2 , that is, when $x < s_1$ or $x > s_2$. The solution set for the inequality $|ax + b| > k$ is green on the x -axis.

Figure 2.69

Figure 2.70

Figure 2.71

Note that in both figures equality (determined by s_1 and s_2) is the boundary between *greater than* and *less than*. For this reason, s_1 and s_2 are called *boundary numbers*.

For example, the graphs of $y = |x + 1|$ and $y = 2$ are shown in Figure 2.71. These graphs intersect at the points $(-3, 2)$ and $(1, 2)$. It follows that the two solutions to

$$|x + 1| = 2$$

are $s_1 = -3$ and $s_2 = 1$. The solutions to $|x + 1| < 2$ lie between $s_1 = -3$ and $s_2 = 1$, which can be written as $-3 < x < 1$. Furthermore, the solutions to $|x + 1| > 2$ lie “outside” $s_1 = -3$ and $s_2 = 1$. This can be written as $x < -3$ or $x > 1$.

These results are generalized as follows.

Absolute Value Inequalities

Let the solutions to $|ax + b| = k$ be s_1 and s_2 , where $s_1 < s_2$ and $k > 0$.

1. $|ax + b| < k$ is equivalent to $s_1 < x < s_2$.
2. $|ax + b| > k$ is equivalent to $x < s_1$ or $x > s_2$.

Similar statements can be made for inequalities involving \leq or \geq .

NOTE The union symbol \cup may be used to write $x < s_1$ or $x > s_2$ in interval notation. For example, $x < -3$ or $x > 1$ is written as $(-\infty, -3) \cup (1, \infty)$ in interval notation. This indicates that the solution set includes all real numbers in either $(-\infty, -3)$ or $(1, \infty)$.

EXAMPLE 6 Solving inequalities involving absolute values symbolically

Solve each inequality symbolically. Write the solution set in interval notation.

(a) $|2x - 5| \leq 6$ (b) $|5 - x| > 3$

SOLUTION

(a) Begin by solving $|2x - 5| = 6$, or equivalently, $2x - 5 = \pm 6$.

$$\begin{array}{rcl} 2x - 5 = 6 & \text{or} & 2x - 5 = -6 \\ 2x = 11 & \text{or} & 2x = -1 \\ x = \frac{11}{2} & \text{or} & x = -\frac{1}{2} \end{array}$$

The solutions to $|2x - 5| = 6$ are $-\frac{1}{2}$ and $\frac{11}{2}$. The solution set for the inequality $|2x - 5| \leq 6$ includes all real numbers x satisfying $-\frac{1}{2} \leq x \leq \frac{11}{2}$. In interval notation this is written as $[-\frac{1}{2}, \frac{11}{2}]$.

(b) To solve $|5 - x| > 3$, begin by solving $|5 - x| = 3$, or equivalently, $5 - x = \pm 3$.

$$\begin{array}{rcl} 5 - x = 3 & \text{or} & 5 - x = -3 \\ -x = -2 & \text{or} & -x = -8 \\ x = 2 & \text{or} & x = 8 \end{array}$$

The solutions to $|5 - x| = 3$ are 2 and 8. The solution set for $|5 - x| > 3$ includes all real numbers x left of 2 or right of 8. Thus $|5 - x| > 3$ is equivalent to $x < 2$ or $x > 8$. In interval notation this is written as $(-\infty, 2) \cup (8, \infty)$.

Now Try Exercises 55 and 63

EXAMPLE 7 Analyzing the temperature range in Santa Fe

The inequality $|T - 49| \leq 20$ describes the range of monthly average temperatures T in degrees Fahrenheit for Santa Fe, New Mexico. (Source: A. Miller and J. Thompson, *Elements of Meteorology*.)

- (a) Solve this inequality graphically and symbolically.
 (b) The high and low monthly average temperatures satisfy the absolute value equation $|T - 49| = 20$. Use this fact to interpret the results from part (a).

SOLUTION

- (a) **Graphical Solution** Graph $Y_1 = \text{abs}(X - 49)$ and $Y_2 = 20$, as in Figure 2.72. The V-shaped graph of y_1 intersects the horizontal line at the points $(29, 20)$ and $(69, 20)$. See Figures 2.73 and 2.74. The graph of y_1 is below the graph of y_2 between these two points. Thus the solution set consists of all temperatures T satisfying $29 \leq T \leq 69$.

Figure 2.72

Figure 2.73

Figure 2.74

Symbolic Solution First solve the related equation $|T - 49| = 20$.

$$\begin{array}{rcl} T - 49 = -20 & \text{or} & T - 49 = 20 \\ T = 29 & \text{or} & T = 69 \end{array}$$

Thus by our previous discussion $|T - 49| \leq 20$ is equivalent to $29 \leq T \leq 69$.

- (b) The solutions to $|T - 49| = 20$ are 29 and 69. Therefore the monthly average temperatures in Santa Fe vary between a low of 29°F (January) and a high of 69°F (July). The monthly averages are always within 20 degrees of 49°F. Now Try Exercise 77

An Alternative Method There is a second symbolic method that can be used to solve absolute value inequalities. This method is often used in advanced mathematics courses, such as calculus. It is based on the following two properties.

Absolute Value Inequalities (Alternative Method)

Let k be a positive number.

1. $|ax + b| < k$ is equivalent to $-k < ax + b < k$.
2. $|ax + b| > k$ is equivalent to $ax + b < -k$ or $ax + b > k$.

Similar statements can be made for inequalities involving \leq or \geq .

EXAMPLE 8 Using an alternative method

Solve each absolute value inequality. Write your answer in interval notation.

(a) $|4 - 5x| \leq 3$ (b) $|-4x - 6| > 2$

SOLUTION

(a) $|4 - 5x| \leq 3$ is equivalent to the following three-part inequality.

$$-3 \leq 4 - 5x \leq 3 \quad \text{Equivalent inequality}$$

$$-7 \leq -5x \leq -1 \quad \text{Subtract 4 from each part.}$$

$$\frac{7}{5} \geq x \geq \frac{1}{5} \quad \text{Divide each part by } -5; \text{ reverse the inequality.}$$

In interval notation the solution is $\left[\frac{1}{5}, \frac{7}{5}\right]$.

(b) $|-4x - 6| > 2$ is equivalent to the following compound inequality.

$$-4x - 6 < -2 \quad \text{or} \quad -4x - 6 > 2 \quad \text{Equivalent compound inequality}$$

$$-4x < 4 \quad \text{or} \quad -4x > 8 \quad \text{Add 6 to each side.}$$

$$x > -1 \quad \text{or} \quad x < -2 \quad \text{Divide each by } -4; \text{ reverse the inequality.}$$

In interval notation the solution set is $(-\infty, -2) \cup (-1, \infty)$.

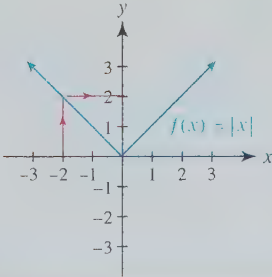

Now Try Exercises 57 and 61

CLASS DISCUSSION

Sketch the graphs of $y = ax + b$, $y = |ax + b|$, $y = -k$, and $y = k$ on one xy -plane. Now use these graphs to explain why the alternative method for solving absolute value inequalities is correct.

2.5 Putting It All Together

The following table summarizes some important concepts from this section.

Concept	Explanation	Examples
Absolute value function	$f(x) = x $: The output from the absolute value function is never negative. $f(x) = x $ is equivalent to $f(x) = \sqrt{x^2}$.	$f(-2) = -2 = 2$

2.5

Exercises

Basic Concepts

Exercises 1–8: Let $a \neq 0$.

1. Solve $|x| = 3$. 2. Solve $|x| \leq 3$.
 3. Solve $|x| > 3$. 4. Solve $|ax + b| \leq -2$.

5. Describe the graph of $y = |ax + b|$.6. Solve $|ax + b| = 0$.7. Rewrite $\sqrt{36a^2}$ by using an absolute value.8. Rewrite $\sqrt{(ax + b)^2}$ by using an absolute value.

9. $y = |x + 1|$

10. $y = |1 - x|$

11. $y = |2x - 3|$

12. $y = |\frac{1}{2}x + 1|$

Exercises 13–18: (Refer to Example 1.) Do the following.

(a) Graph $y = f(x)$.(b) Use the graph of $y = f(x)$ to sketch a graph of the equation $y = |f(x)|$.(c) Determine the x -intercept for the graph of the equation $y = |f(x)|$.

Absolute Value Graphs

Exercises 9–12: Graph by hand.

(a) Find the x -intercept.

(b) Determine where the graph is increasing and where it is decreasing.

13. $y = 2x$

14. $y = \frac{1}{2}x$

15. $y = 3x - 3$

16. $y = 2x - 4$

17. $y = 6 - 2x$

18. $y = 2 - 4x$

Absolute Value Equations and Inequalities

Exercises 19–40: Solve the absolute value equation.

19. $|-2x| = 4$ 20. $|3x| = -6$
21. $|5x - 7| = 2$ 22. $|-3x - 2| = 5$
23. $|3 - 4x| = 5$ 24. $|2 - 3x| = 1$
25. $|-6x - 2| = 0$ 26. $|6x - 9| = 0$
27. $|7 - 16x| = 0$ 28. $|-x - 4| = 0$
29. $|17x - 6| = -3$ 30. $|-8x - 11| = -7$
31. $|1.2x - 1.7| - 1 = 3$ 32. $|3 - 3x| - 2 = 2$
33. $|4x - 5| + 3 = 2$ 34. $|4.5 - 2x| + 1.1 = 9.7$
35. $|2x - 9| = |8 - 3x|$ 36. $|x - 3| = |8 - x|$
37. $|\frac{3}{4}x - \frac{1}{4}| = |\frac{3}{4} - \frac{1}{4}x|$ 38. $|\frac{1}{2}x + \frac{3}{2}| = |\frac{3}{2}x - \frac{7}{2}|$
39. $|15x - 5| = |35 - 5x|$
40. $|20x - 40| = |80x - 20|$

Exercises 41 and 42: The graphs of f and g are shown. Solve each equation and inequality.

41. (a) $f(x) = g(x)$

(b) $f(x) < g(x)$

(c) $f(x) > g(x)$

42. (a) $f(x) = g(x)$

(b) $f(x) \leq g(x)$

(c) $f(x) \geq g(x)$

Exercises 43 and 44: Solve each equation or inequality.

43. (a) $|2x - 3| = 1$ 44. (a) $|5 - x| = 2$
- (b) $|2x - 3| < 1$ (b) $|5 - x| \leq 2$
- (c) $|2x - 3| > 1$ (c) $|5 - x| \geq 2$

Exercises 45–48: Solve the equation

- (a) graphically,
(b) numerically, and
(c) symbolically.

Then solve the related inequality.

45. $|2x - 5| = 10$, $|2x - 5| < 10$
46. $|3x - 4| = 8$, $|3x - 4| \leq 8$
47. $|5 - 3x| = 2$, $|5 - 3x| > 2$
48. $|4x - 7| = 5$, $|4x - 7| \geq 5$

Exercises 49–54: Solve the equation symbolically. Then solve the related inequality.

49. $|2.1x - 0.7| = 2.4$, $|2.1x - 0.7| \geq 2.4$
50. $|\frac{1}{2}x - \frac{3}{4}| = \frac{7}{4}$, $|\frac{1}{2}x - \frac{3}{4}| \leq \frac{7}{4}$
51. $|3x| + 5 = 6$, $|3x| + 5 > 6$
52. $|x| - 10 = 25$, $|x| - 10 < 25$
53. $|\frac{2}{3}x - \frac{1}{2}| = -\frac{1}{4}$, $|\frac{2}{3}x - \frac{1}{2}| \leq -\frac{1}{4}$
54. $|5x - 0.3| = -4$, $|5x - 0.3| > -4$

You Decide the Method

Exercises 55–66: Solve the inequality. Write the solution in interval notation.

55. $|3x - 1| < 8$ 56. $|15 - x| < 7$
57. $|7 - 4x| \leq 11$ 58. $|-3x + 1| \leq 5$
59. $|0.5x - 0.75| < 2$ 60. $|2.1x - 5| \leq 8$
61. $|2x - 3| > 1$ 62. $|5x - 7| > 2$
63. $|-3x + 8| \geq 3$ 64. $|-7x - 3| \geq 5$
65. $|0.25x - 1| > 3$ 66. $|-0.5x + 5| \geq 4$

Domain and Range

67. If $f(k) = -6$, what is the value of $|f(k)|$?
68. If $f(k) = 17$, what is the value of $|f(k)|$?
69. If the domain of $f(x)$ is given by $[-2, 4]$, what is the domain of $|f(x)|$?
70. If the domain of $f(x)$ is given by $(-\infty, 0]$, what is the domain of $|f(x)|$?

71. If the range of $f(x)$ is given by $(-\infty, 0]$, what is the range of $|f(x)|$?
72. If the range of $f(x)$ is given by $(-4, 5)$, what is the range of $|f(x)|$?

Applications

73. **Speed Limits** The lawful speeds S on an interstate highway satisfy $|S - 57.5| \leq 17.5$. Find the maximum and minimum speed limits by solving the absolute value equation $|S - 57.5| = 17.5$.
74. **Human Cannonball** A human cannonball plans to travel 180 feet and land squarely on a net with a 70-foot-long safe zone.
- What distances D can this performer travel and still land safely on the net?
 - Use an absolute value inequality to describe the restrictions on D .
75. **Temperature and Altitude** Air temperature decreases as altitude increases. If the ground temperature is 80°F , then the air temperature x miles high is $T = 80 - 19x$.
- Determine the altitudes x where the air temperature T is between 0°F and 32°F , inclusive.
 - Use an absolute value inequality to describe these altitudes.
76. **Dew Point and Altitude** The dew point decreases as altitude increases. If the ground temperature is 80°F , then the dew point x miles high is $D = 80 - \frac{29}{5}x$.
- Determine the altitudes x where the dew point D is between 50°F and 60°F , inclusive.
 - Use an absolute value inequality to describe these altitudes.

Exercises 77–82: Average Temperatures (Refer to Example 7.) The inequality describes the range of monthly average temperatures T in degrees Fahrenheit at a certain location.

- Solve the inequality.
 - If the high and low monthly average temperatures satisfy equality, interpret the inequality.
77. $|T - 43| \leq 24$, Marquette, Michigan
78. $|T - 62| \leq 19$, Memphis, Tennessee
79. $|T - 50| \leq 22$, Boston, Massachusetts
80. $|T - 10| \leq 36$, Chesterfield, Canada
81. $|T - 61.5| \leq 12.5$, Buenos Aires, Argentina

82. $|T - 43.5| \leq 8.5$, Punta Arenas, Chile

83. **Error in Measurements** Products are often manufactured to be within a specified tolerance of a given size. For instance, if an aluminum can is supposed to have a diameter of 3 inches, either 2.99 inches or 3.01 inches might be acceptable. If the maximum error in the diameter d of a can is limited to 0.004 inch, then d must satisfy the absolute value inequality

$$|d - 3| \leq 0.004.$$

Solve this inequality and interpret the results.

84. **Error in Measurements** (Refer to Exercise 83.) Suppose that a 12-inch ruler must have the correct length L to within 0.0002 inch.
- Write an absolute value inequality for L that describes this requirement.
 - Solve this inequality and interpret the results.
85. **Relative Error** If a quantity is measured to be Q and its exact value is A , then the relative error in Q is

$$\left| \frac{Q - A}{A} \right|.$$

If the exact value is $A = 35$ and you want the relative error in Q to be less than or equal to 0.02 (or 2%), what values for Q are possible?

86. **Relative Error** (Refer to Exercise 85.) The exact perimeter P of a square is 50 feet. What measured lengths are possible for the side S of the square to have relative error in the perimeter that is less than or equal to 0.04 (or 4%)?

Writing about Mathematics

87. Explain how to solve $|ax + b| = k$ with $k > 0$ symbolically. Give an example.
88. Explain how you can use the solutions to $|ax + b| = k$ with $k > 0$ to solve the inequalities $|ax + b| < k$ and $|ax + b| > k$. Give an example.

EXTENDED AND DISCOVERY EXERCISES

- Let δ be a positive number and let x and c be real numbers. Write an absolute value inequality that expresses that the distance between x and c on the number line is less than δ .
- Let ϵ be a positive number, L be a real number, and f be a function. Write an absolute value inequality that expresses that the distance between $f(x)$ and L on the number line is less than ϵ .

CHECKING BASIC CONCEPTS FOR SECTION 2.5

- Rewrite $\sqrt{4x^2}$ by using an absolute value.
- Graph $y = |3x - 2|$ by hand.
- Solve the equation $|2x - 1| = 5$.
 - Use part (a) to solve the absolute value inequalities $|2x - 1| \leq 5$ and $|2x - 1| > 5$.
- Solve each equation or inequality. For each inequality, write the solution set in interval notation.
 - $|2 - 5x| - 4 = -1$
 - $|3x - 5| \leq 4$
 - $|\frac{1}{2}x - 3| > 5$
- Solve $|x + 1| = |2x|$.

2 Summary

CONCEPT EXPLANATION AND EXAMPLES

SECTION 2.1 LINEAR FUNCTIONS AND MODELS

Linear Function

A linear function can be written as $f(x) = ax + b$. Its graph is a line.

Example: $f(x) = -2x + 5$; slope = -2 , y -intercept = 5

Linear Model

If a quantity increases or decreases by a constant amount for each unit increase in x , then it can be modeled by a linear function given by

$$f(x) = (\text{constant rate of change})x + (\text{initial amount}).$$

Example: If water is pumped from a full 100-gallon tank at 7 gallons per minute, then $A(t) = 100 - 7t$ gives the gallons of water in the tank after t minutes.

Piecewise-Defined Function

A function defined by more than one formula on its domain

Examples: Step function, greatest integer function, absolute value function, and

$$f(x) = \begin{cases} 4 - x & \text{if } -4 \leq x < 1 \\ 3x & \text{if } 1 \leq x \leq 5 \end{cases}$$

It follows that $f(2) = 6$ because if $1 \leq x \leq 5$ then $f(x) = 3x$. Note that f is continuous on its domain of $[-4, 5]$.

Linear Regression

One way to determine a linear function or a line that models data is to use the method of least squares. This method determines a unique line that can be found with a calculator. The correlation coefficient r ($-1 \leq r \leq 1$) measures how well a line fits the data.

Example: The line of least squares modeling the data $(1, 1)$, $(3, 4)$, and $(4, 6)$ is given by $y \approx 1.643x - 0.714$, with $r \approx 0.997$.

CONCEPT**EXPLANATION AND EXAMPLES****SECTION 2.2 EQUATIONS OF LINES****Point-Slope Form**

If a line with slope m passes through (x_1, y_1) , then

$$y = m(x - x_1) + y_1 \quad \text{or} \quad y - y_1 = m(x - x_1).$$

Example: $y = -\frac{3}{4}(x + 4) + 5$ has slope $-\frac{3}{4}$ and passes through $(-4, 5)$.

Slope-Intercept Form

If a line has slope m and y -intercept b , then $y = mx + b$.

Example: $y = 3x - 4$ has slope 3 and y -intercept -4 .

Determining Intercepts

To find the x -intercept(s), let $y = 0$ in the equation and solve for x .

To find the y -intercept(s), let $x = 0$ in the equation and solve for y .

Examples: The x -intercept on the graph of $3x - 4y = 12$ is 4 because $3x - 4(0) = 12$ implies that $x = 4$.

The y -intercept on the graph of $3x - 4y = 12$ is -3 because $3(0) - 4y = 12$ implies that $y = -3$.

Horizontal and Vertical Lines

A horizontal line passing through the point (a, b) is given by $y = b$, and a vertical line passing through (a, b) is given by $x = a$.

Examples: The horizontal line $y = -3$ passes through $(6, -3)$.

The vertical line $x = 4$ passes through $(4, -2)$.

Parallel and Perpendicular Lines

Parallel lines have equal slopes satisfying $m_1 = m_2$, and perpendicular lines have slopes satisfying $m_1 m_2 = -1$, provided neither line is vertical.

Examples: The lines $y_1 = 3x - 1$ and $y_2 = 3x + 4$ are parallel.

The lines $y_1 = 3x - 1$ and $y_2 = -\frac{1}{3}x + 4$ are perpendicular.

Direct Variation

A quantity y is directly proportional to a quantity x , or y varies directly with x , if $y = kx$, where $k \neq 0$. If data vary directly, the ratios $\frac{y}{x}$ are equal to the constant of variation k .

Example: If a person works for \$8 per hour, then that person's pay P is directly proportional to, or varies directly with, the number of hours H that the person works by the equation $P = 8H$, where the constant of variation is $k = 8$.

SECTION 2.3 LINEAR EQUATIONS**Linear Equation**

Can be written as $ax + b = 0$ with $a \neq 0$ and has one solution

Example: The solution to $2x - 4 = 0$ is 2 because $2(2) - 4 = 0$.

CONCEPT

EXPLANATION AND EXAMPLES

SECTION 2.3 LINEAR EQUATIONS (CONTINUED)

Properties of Equality

Addition: $a = b$ is equivalent to $a + c = b + c$.

Multiplication: $a = b$ is equivalent to $ac = bc$, provided $c \neq 0$.

Example: $\frac{1}{2}x - 4 = 3$ *Given equation*

$$\frac{1}{2}x = 7 \quad \text{Addition property; add 4.}$$

$$x = 14 \quad \text{Multiplication property; multiply by 2.}$$

Contradiction, Identity, and Conditional Equation

A contradiction has no solutions, an identity is true for all (meaningful) values of the variable, and a conditional equation is true for some, but not all, values of the variable.

Examples: $3(1 - 2x) = 3 - 6x$ *Identity*

$$x + 5 = x \quad \text{Contradiction}$$

$$x - 1 = 4 \quad \text{Conditional equation}$$

Intersection-of-Graphs and x-Intercept Methods

Intersection-of-graphs method: Set y_1 equal to the left side of the equation and set y_2 equal to the right side. The x -coordinate of a point of intersection is a solution.

Example: The graphs of $y_1 = 2x$ and $y_2 = x + 1$ intersect at $(1, 2)$, so the solution to the linear equation $2x = x + 1$ is 1. See the figure below on the left.

x-intercept method: Move all terms to the left side of the equation. Set y_1 equal to the left side of the equation. The solutions are the x -intercepts.

Example: Write $2x = x + 1$ as $2x - (x + 1) = 0$. Graph $y_1 = 2x - (x + 1)$. The only x -intercept is 1, as shown in the figure on the right.

Point of Intersection (1, 2)

x-intercept: 1

Problem-Solving Strategies

- STEP 1:** Read the problem and make sure you understand it. Assign a variable to what you are being asked to find. If necessary, write other quantities in terms of this variable.
- STEP 2:** Write an equation that relates the quantities described in the problem. You may need to sketch a diagram and refer to known formulas.
- STEP 3:** Solve the equation and determine the solution.
- STEP 4:** Look back and check your solution. Does it seem reasonable?

CONCEPT EXPLANATION AND EXAMPLES

SECTION 2.4 LINEAR INEQUALITIES

Linear Inequality

Can be written as $ax + b > 0$ with $a \neq 0$, where $>$ can be replaced by $<$, \leq , or \geq . If the solution to $ax + b = 0$ is k , then the solution to the linear inequality $ax + b > 0$ is either the interval $(-\infty, k)$ or the interval (k, ∞) .

Example: $3x - 1 < 2$ is linear since it can be written as $3x - 3 < 0$. The solution set is $\{x | x < 1\}$, or $(-\infty, 1)$.

Properties of Inequality

Addition: $a < b$ is equivalent to $a + c < b + c$.

Multiplication: $a < b$ is equivalent to $ac < bc$ when $c > 0$.

$a < b$ is equivalent to $ac > bc$ when $c < 0$.

Example: $-3x - 4 < 14$

Given equation

$$-3x < 18$$

Addition property: add 4.

$$x > -6$$

Multiplication property: divide by -3 . Reverse the inequality symbol.

Compound Inequality

Example: $x \geq -2$ and $x \leq 4$, or equivalently, $-2 \leq x \leq 4$. This is called a three-part inequality.

SECTION 2.5 ABSOLUTE VALUE EQUATIONS AND INEQUALITIES

Absolute Value Function

An absolute value function is defined by $f(x) = |x|$. Its graph is V-shaped. An equivalent formula is $f(x) = \sqrt{x^2}$.

Examples: $f(-9) = |-9| = 9$; $\sqrt{(2x+1)^2} = |2x+1|$

Absolute Value Equations

$|ax + b| = k$ with $k > 0$ is equivalent to $ax + b = \pm k$.

Example: $|2x - 3| = 4$ is equivalent to $2x - 3 = 4$ or $2x - 3 = -4$.

The solutions are $\frac{7}{2}$ and $-\frac{1}{2}$.

Absolute Value Inequalities

Let the solutions to $|ax + b| = k$ be s_1 and s_2 , where $s_1 < s_2$ and $k > 0$.

1. $|ax + b| < k$ is equivalent to $s_1 < x < s_2$.

2. $|ax + b| > k$ is equivalent to $x < s_1$ or $x > s_2$.

Similar statements can be made for inequalities involving \leq or \geq .

Example: The solutions to $|2x + 1| = 5$ are given by $x = -3$ and $x = 2$.
The solutions to $|2x + 1| < 5$ are given by $-3 < x < 2$.
The solutions to $|2x + 1| > 5$ are given by $x < -3$ or $x > 2$.

2

Review Exercises

Exercises 1 and 2: The graph of a linear function f is shown.

- Identify the slope, y -intercept, and x -intercept.
- Write a formula for f .
- Find any zeros of f .

Exercises 3 and 4: Find $f(x) = ax + b$ so that f models the data exactly.

3.

x	1	2	3	4
$f(x)$	2.5	0	-2.5	-5

4.

x	-3	6	15	24
$f(x)$	-1.65	-1.2	-0.75	-0.3

Exercises 5 and 6: Graph the linear function.

5. $f(x) = -\frac{2}{3}x$ 6. $g(x) = 4 - 2x$

- Write a formula for a linear function f whose graph has slope -2 and passes through $(-2, 3)$.
- Find the average rate of change of $f(x) = -3x + 8$ from -2 to 3 .

Exercises 9–14: Find the slope-intercept form of the equation of a line satisfying the conditions.

- Slope 7 , passing through $(-3, 9)$
- Passing through $(2, -4)$ and $(7, -3)$
- Passing through $(1, -1)$, parallel to $y = -3x + 1$
- Passing through the point $(-2, 1)$, perpendicular to the line $y = 2(x + 5) - 22$
- Parallel to the line segment connecting $(0, 3.1)$ and $(5.7, 0)$, passing through $(1, -7)$
- Perpendicular to $y = -\frac{5}{7}x$, passing through $(\frac{6}{7}, 0)$

Exercises 15–20: Find an equation of the specified line.

- Parallel to the y -axis, passing through $(6, -7)$
- Parallel to the x -axis, passing through $(-3, 4)$
- Horizontal, passing through $(1, 3)$
- Vertical, passing through $(1.5, 1.9)$
- Vertical with x -intercept 2.7
- Horizontal with y -intercept -8

Exercises 21 and 22: Determine the x - and y -intercepts for the graph of the equation. Graph the equation.

21. $5x - 4y = 20$ 22. $\frac{x}{3} - \frac{y}{2} = 1$

Exercises 23–28: Solve the linear equation either symbolically or graphically.

23. $5x - 22 = 10$ 24. $5(4 - 2x) = 16$

25. $-2(3x - 7) + x = 2x - 1$

26. $5x - \frac{1}{2}(4 - 3x) = \frac{3}{2} - (2x + 3)$

27. $\pi x + 1 = 6$

28. $\frac{x - 4}{2} = x + \frac{1 - 2x}{3}$

 Exercises 29 and 30: Use a table to solve each linear equation numerically to the nearest tenth.

29. $3.1x - 0.2 - 2(x - 1.7) = 0$

30. $\sqrt{7} - 3x - 2.1(1 + x) = 0$

Exercises 31–34: Complete the following.

- Solve the equation symbolically.
 - Classify the equation as a contradiction, an identity, or a conditional equation.
- $4(6 - x) = -4x + 24$
 - $\frac{1}{2}(4x - 3) + 2 = 3x - (1 + x)$
 - $5 - 2(4 - 3x) + x = 4(x - 3)$
 - $\frac{x - 3}{4} + \frac{3}{4}x - 5(2 - 7x) = 36x - \frac{43}{4}$

Exercises 35–38: Express the inequality in interval notation.

35. $x > -3$

36. $x \leq 4$

37. $-2 \leq x < \frac{3}{4}$

38. $x \leq -2$ or $x > 3$

Exercises 39–44: Solve the linear inequality. Write the solution set in set-builder or interval notation.

39. $3x - 4 \leq 2 + x$

40. $-2x + 6 \leq -3x$

41. $\frac{2x - 5}{2} < \frac{5x + 1}{5}$

42. $-5(1 - x) > 3(x - 3) + \frac{1}{2}x$

43. $-2 \leq 5 - 2x < 7$

44. $-1 < \frac{3x - 5}{-3} < 3$

Exercises 45 and 46: Solve the inequality graphically.

45. $2x > x - 1$

46. $-1 \leq 1 + x \leq 2$

47. The graphs of two linear functions f and g are shown in the figure. Solve each equation or inequality.

(a) $f(x) = g(x)$

(b) $f(x) < g(x)$

(c) $f(x) > g(x)$

48. The graphs of three linear functions f , g , and h with domains $D = \{x | 0 \leq x \leq 7\}$ are shown in the figure. Solve each equation or inequality.

(a) $f(x) = g(x)$

(b) $g(x) = h(x)$

(c) $f(x) < g(x) < h(x)$

(d) $g(x) > h(x)$

49. Use $f(x)$ to complete the following.

$$f(x) = \begin{cases} 8 + 2x & \text{if } -3 \leq x \leq -1 \\ 5 - x & \text{if } -1 < x \leq 2 \\ x + 1 & \text{if } 2 < x \leq 5 \end{cases}$$

(a) Evaluate f at $x = -2, -1, 2$, and 3 .

(b) Sketch a graph of f . Is f continuous on its domain?

(c) Determine the x -value(s) where $f(x) = 3$.

50. If $f(x) = \lfloor 2x - 1 \rfloor$, evaluate $f(-3.1)$ and $f(2.5)$.

Exercises 51–54: Solve the equation.

51. $|2x - 5| - 1 = 8$

52. $|3 - 7x| = 10$

53. $|6 - 4x| = -2$

54. $|9 + x| = |3 - 2x|$

Exercises 55–58: Solve the equation. Use the solutions to help solve the related inequality.

55. $|x| = 3, \quad |x| > 3$

56. $|-3x + 1| = 2, \quad |-3x + 1| < 2$

57. $|3x - 7| = 10, \quad |3x - 7| > 10$

58. $|4 - x| = 6, \quad |4 - x| \leq 6$

Exercises 59–62: Solve the inequality.

59. $|3 - 2x| < 9$

60. $|-2x - 3| > 3$

61. $|\frac{1}{3}x - \frac{1}{6}| \geq 1$

62. $|\frac{1}{2}x| - 3 \leq 5$

Applications

63. **Median Income** The median U.S. family income between 1980 and 2005 can be modeled by the formula $f(x) = 1450(x - 1980) + 20,000$, where x is the year. (Source: Department of Commerce.)

(a) Solve the equation $f(x) = 34,500$ graphically and interpret the solution.

(b) Solve part (a) symbolically.

64. **Course Grades** In order to receive a B grade in a college course, it is necessary to have an overall average of 80% correct on two 1-hour exams of 75 points each and one final exam of 150 points. If a person scores 55 and 72 on the 1-hour exams, what is the minimum score that the person can receive on the final exam and still earn a B?

65. **Medicare Costs** Estimates for Medicare costs in billions of dollars in year x can be modeled by the formula $f(x) = 18x - 35,750$, where $1995 \leq x \leq 2007$. Determine when Medicare costs were from \$268 to \$358 billion. (Source: Office of Management and Budget.)

66. **Temperature Scales** The table shows equivalent temperatures in degrees Celsius and degrees Fahrenheit.

°F	-40	32	59	95	212
°C	-40	0	15	35	100

-  (a) Plot the data with Fahrenheit temperature on the x -axis and Celsius temperature on the y -axis. What type of relation exists between the data?
- (b) Find a function C that receives the Fahrenheit temperature x as input and outputs the corresponding Celsius temperature. Interpret the slope.
- (c) If the temperature is 83°F , what is it in degrees Celsius?
67. **Distance from Home** The graph depicts the distance y that a person driving a car on a straight road is from home after x hours. Interpret the graph. What speeds did the car travel?

68. **ACT Scores** The table lists the average composite ACT scores for selected years. Note that in 2007 the average score was 21.2. (Source: The American College Testing Program.)

Year	1989	1990	1991	1992	1993	1994
Score	20.6	20.6	20.6	20.6	20.7	20.8

- (a) Make a line graph of the data.
- (b) Let this line graph represent a piecewise-linear function f . Find a formula for f .
- (c) What is the domain of f ?
69. **Population Estimates** In 2004 the population of a city was 143,247, and in 2008 it was 167,933. Estimate the population in 2006.
70. **Distance** A driver of a car is initially 455 miles from home, traveling toward home on a straight freeway at 70 miles per hour.

- (a) Write a formula for a linear function f that models the distance between the driver and home after x hours.
- (b) Graph f . What is an appropriate domain?
- (c) Identify the x - and y -intercepts. Interpret each.

71. **Working Together** Suppose that one worker can shovel snow from a storefront sidewalk in 50 minutes and another worker can shovel it in 30 minutes. How long will it take if they work together?

72. **Antifreeze** Initially, a tank contains 20 gallons of a 30% antifreeze solution. How many gallons of an 80% antifreeze solution should be added to the tank in order to increase the concentration of the antifreeze in the tank to 50%?

73. **Running** An athlete traveled 13.5 miles in 1 hour and 48 minutes, jogging at 7 miles per hour and then at 8 miles per hour. How long did the runner jog at each speed?

-  74. **Least-Squares Fit** The table lists the actual annual cost y to drive a midsize car 15,000 miles per year for selected years x .

x	1960	1970	1980	1990	2000
y	\$1394	\$1763	\$3176	\$5136	\$6880

Source: Runzheimer International.

- (a) Predict whether the correlation coefficient is positive, negative, or zero.
- (b) Find a least-squares regression line that models these data. What is the correlation coefficient?
- (c) Estimate the cost of driving a midsize car in 1995.
- (d) Estimate the year when the cost could reach \$8000.
75. The table lists data that are exactly linear.

x	-3	-2	-1	1	2
y	6.6	5.4	4.2	1.8	0.6

- (a) Determine the slope-intercept form of the line that passes through these data points.
- (b) Predict y when $x = -1.5$ and 3.5 . State whether these calculations involve interpolation or extrapolation.
- (c) Predict x when $y = 1.3$.

76. **Geometry** A rectangle is twice as long as it is wide and has a perimeter of 78 inches. Find the width and length of this rectangle.
77. **Flow Rates** A water tank has an inlet pipe with a flow rate of 5 gallons per minute and an outlet pipe with a flow rate of 3 gallons per minute. A pipe can be either closed or completely open. The graph shows the number of gallons of water in the tank after x minutes have elapsed. Use the concept of slope to interpret each piece of this graph.

78. **Flow Rates** (Refer to Exercise 77.) Suppose the tank is modified so that it has a second inlet pipe, which flows at a rate of 2 gallons per minute. Interpret the graph by determining when each inlet and outlet pipe is open or closed.

79. **Air Temperature** For altitudes up to 4 kilometers, moist air will cool at a rate of about 6°C per kilometer. If the ground temperature is 25°C , at what altitudes would the air temperature be from 5°C to 15°C ? (Source: A Miller and R. Anthes, *Meteorology*.)

80. **Water Pollution** At one time the Thames River in England supported an abundant community of fish. Pollution then destroyed all the fish in a 40-mile stretch near its mouth for a 45-year period beginning in 1915. Since then, improvement of sewage treatment facilities and other ecological steps have resulted in a dramatic increase in the number of different fish present. The number of species present from 1967 to 1978 can be modeled by $f(x) = 6.15x - 12,059$, where x is the year.

- (a) Estimate the year when the number of species first exceeded 70.
- (b) Estimate the years when the number of species was between 50 and 100.

81. **Relative Error** The actual length of a side of a building is 52.3 feet. How accurately must an apprentice carpenter measure this side to have the relative error in the measurement be less than 0.003 (0.3%)? (Hint: Use $|\frac{C-A}{A}|$, where C is the carpenter's measurement and A is the actual length.)

82. **Brown Trout** Due to acid rain, the percentage of lakes in Scandinavia that lost their population of brown trout increased dramatically between 1940 and 1975. Based on a sample of 2850 lakes, this percentage can be approximated by the following piecewise-linear function. (Source: C. Mason, *Biology of Freshwater Pollution*.)

$$f(x) = \begin{cases} \frac{11}{20}(x - 1940) + 7 & \text{if } 1940 \leq x < 1960 \\ \frac{32}{15}(x - 1960) + 18 & \text{if } 1960 \leq x \leq 1975 \end{cases}$$

- (a) Determine the percentage of lakes that lost brown trout by 1947 and by 1972.
- (b) Sketch a graph of f .
- (c) Is f a continuous function on its domain?

EXTENDED AND DISCOVERY EXERCISES

1. **Archeology** It is possible for archeologists to estimate the height of an adult based only on the length of the humerus, a bone located between the elbow and the shoulder. The approximate relationship between the height y of an individual and the length x of the humerus is shown in the table for both males and females. All measurements are in inches. Although individual values may vary, tables like this are the result of measuring bones from many skeletons.

x	8	9	10	11
y (females)	50.4	53.5	56.6	59.7
y (males)	53.0	56.0	59.0	62.0

x	12	13	14
y (females)	62.8	65.9	69.0
y (males)	65.0	68.0	71.0

- (a) Find the estimated height of a female with a 12-inch humerus.
- (b) Plot the ordered pairs (x, y) for both sexes. What type of relation exists between the data?

- (c) For each 1-inch increase in the length of the humerus, what are the corresponding increases in the heights of females and of males?
- (d) Determine linear functions f and g that model these data for females and males, respectively.
- (e) Suppose a humerus from a person of unknown sex is estimated to be between 9.7 and 10.1 inches long. Use f and g to approximate the range for the height of a female and a male.
2. Continuing with Exercise 1, have members of the class measure their heights and the lengths of their humeri (plural of *humerus*) in inches.
- (a) Make a table of the results.
-  (b) Find regression lines that fit the data points for males and females.
- (c) Compare your results with the table in Exercise 1.
3. **A Puzzle** Three people leave for a city 15 miles away. The first person walks 4 miles per hour, and the other two people ride in a car that travels 28 miles per hour. After some time, the second person gets out of the car and walks 4 miles per hour to the city while the driver goes back and picks up the first person. The driver takes the first person to the city. If all three people arrive in the city at the same time, how far did each person walk?

4. **Comparing Ages** The age of Earth is approximately 4.45 billion years. The earliest evidence of dinosaurs dates back 200 million years, whereas the earliest evidence of *Homo sapiens* dates back 300,000 years. If the age of Earth were condensed into one year, determine the approximate times when dinosaurs and *Homo sapiens* first appeared.

5. **Limit Notation** Let ϵ and δ be positive numbers; let x , c , and L be real numbers; and let f be a function. Consider the following: “If the distance between x and c is less than δ , then the distance between $f(x)$ and L is less than ϵ .” Rewrite this sentence by using two absolute value inequalities.

1–2 Cumulative Review Exercises

1. Write 123,000 and 0.0051 in scientific notation.
2. Write 6.7×10^6 and 1.45×10^{-4} in standard form.
3. Evaluate $\frac{4 + \sqrt{2}}{4 - \sqrt{2}}$. Round your answer to the nearest hundredth.
4. The table represents a relation S .
- | | | | | | |
|-----|----|---|---|---|---|
| x | -1 | 0 | 1 | 2 | 3 |
| y | 6 | 4 | 3 | 0 | 0 |
- (a) Does S represent a function?
- (b) Determine the domain and range of S .
5. Find the standard equation of a circle with center $(-2, 3)$ and radius 7.

6. Evaluate $-5^2 - 2 - \frac{10 - 2}{5 - 1}$ by hand.

7. Find the exact distance between $(-3, 5)$ and $(2, -3)$.
8. Find the midpoint of the line segment with endpoints $(5, -2)$ and $(-3, 1)$.
9. Find the domain and range of the function shown in the graph. Evaluate $f(-1)$.

10. Graph f by hand.

(a) $f(x) = 3 - 2x$ (b) $f(x) = |x + 1|$

(c) $f(x) = x^2 - 3$ (d) $f(x) = \sqrt{x + 2}$

Exercises 11 and 12: Complete the following.

(a) Evaluate $f(2)$ and $f(a - 1)$.(b) Determine the domain of f .

11. $f(x) = 5x - 3$

12. $f(x) = \sqrt{2x - 1}$

13. Determine if the graph represents a function. Explain your answer.

14. Write a formula for a function f that computes the cost of taking x credits if credits cost \$80 each and fees are fixed at \$89.15. Find the average rate of change of $f(x) = x^2 - 2x + 1$ from $x = 1$ to $x = 2$.16. Find the difference quotient for $f(x) = 2x^2 - x$.Exercises 17 and 18: The graph of a linear function f is shown.(a) Identify the slope, y -intercept, and x -intercept.(b) Write a formula for f .(c) Find any zeros of f .19. Write a formula for a linear function whose graph has slope -3 and passes through $(\frac{2}{3}, -\frac{2}{3})$.20. If $G(t) = 200 - 10t$ models the gallons of water in a tank after t minutes, interpret the numbers 200 and -10 in the formula for G .

Exercises 21–26: Write an equation of a line satisfying the given conditions. Use slope-intercept form whenever possible.

21. Passing through $(1, -5)$ and $(-3, \frac{1}{2})$ 22. Passing through the point $(-3, 2)$ and perpendicular to the line $y = \frac{2}{3}x - 7$ 23. Parallel to the y -axis and passing through $(-1, 3)$ 24. Slope 30, passing through $(2002, 50)$ 25. Passing through $(-3, 5)$ and parallel to the line segment connecting $(2.4, 5.6)$ and $(3.9, 8.6)$ 26. Perpendicular to the y -axis and passing through the originExercises 27 and 28: Determine the x - and y -intercepts on the graph of the equation. Graph the equation.

27. $-2x + 3y = 6$

28. $x = 2y - 3$

Exercises 29–32: Solve the equation.

29. $4x - 5 = 1 - 2x$ 30. $\frac{2x - 4}{2} = \frac{3x}{7} - 1$

31. $\frac{2}{3}(x - 2) - \frac{4}{5}x = \frac{4}{15} + x$

32. $-0.3(1 - x) - 0.1(2x - 3) = 0.4$

33. Solve $x + 1 = 2x - 2$ graphically and numerically.34. Solve $2x - (5 - x) = \frac{1 - 4x}{2} + 5(x - 2)$. Is this equation either an identity or a contradiction?

Exercises 35–38: Express each inequality in interval notation.

35. $x < 5$

36. $-2 \leq x \leq 5$

37. $x < -2$ or $x > 2$

38. $x \geq -3$

Exercises 39 and 40: Solve the inequality. Write the solution set in set-builder or interval notation.

39. $-3(1 - 2x) + x \leq 4 - (x + 2)$

40. $\frac{1}{3} \leq \frac{2 - 3x}{2} < \frac{4}{3}$

41. The graphs of two linear functions f and g are shown. Solve each equation or inequality.

(a) $f(x) = g(x)$

(b) $f(x) > g(x)$

(c) $f(x) \leq g(x)$

42. Graph f . Is f continuous on the interval $[-4, 4]$?

$$f(x) = \begin{cases} 2 - x & \text{if } -4 \leq x < -2 \\ \frac{1}{2}x + 5 & \text{if } -2 \leq x < 2 \\ 2x + 1 & \text{if } 2 \leq x \leq 4 \end{cases}$$

Exercises 43–46: Solve the equation.

43. $|d + 1| = 5$

44. $|3 - 2x| = 7$

45. $|2t| - 4 = 10$

46. $|11 - 2x| = |3x + 1|$

Exercises 47 and 48: Solve the inequality.

47. $|2t - 5| \leq 5$

48. $|5 - 5t| > 7$

Applications

49. **Volume of a Cylinder** The volume V of a cylinder is given by $V = \pi r^2 h$, where r is the radius of the cylinder and h is its height. If an aluminum can has a volume of 24 cubic inches and a radius of 1.5 inches, find its height to the nearest hundredth of an inch.

50. **Interpreting Slope** The figure shows the weight of a load of gravel in a dump truck. Interpret the slope of each line segment.

51. **Cost** A company's cost C in dollars for making x computers is $C(x) = 500x + 20,000$.

(a) Evaluate $C(1500)$. Interpret the result.

(b) Find the slope of the graph of C . Interpret the slope.

52. **Distance** At midnight car A is traveling north at 60 miles per hour and is located 40 miles south of car B. Car B is traveling west at 70 miles per hour. Approximate the distance between the cars at 1:15 A.M. to the nearest tenth of a mile.

53. **Average Rate of Change** On a warm summer day the Fahrenheit temperature x hours past noon is given by the formula $T(x) = 70 + \frac{3}{2}x^2$.

(a) Find the average rate of change of T from 2:00 P.M. to 4:00 P.M.

(b) Interpret this average rate of change.

54. **Distance from Home** A driver is initially 270 miles from home, traveling toward home on a straight interstate at 72 miles per hour.

(a) Write a formula for a function D that models the distance between the driver and home after x hours.

(b) What is an appropriate domain for D ? Graph D .

(c) Identify the x - and y -intercepts. Interpret each.

55. **Working Together** Suppose one person can mow a large lawn in 5 hours with a riding mower and it takes another person 12 hours to mow the lawn with a push mower. How long will it take to mow the lawn if the two people work together?

56. **Running** An athlete traveled 15 miles in 1 hour and 45 minutes, running at 8 miles per hour and then 10 miles per hour. How long did the athlete run at each speed?

57. **Chicken Consumption** In 2001 Americans ate, on average, 56 pounds of chicken annually. This amount is expected to increase to 61 pounds in 2012. (Source: Department of Agriculture.)

(a) Determine a formula

$$f(x) = m(x - x_1) + y_1$$

that models these data. Let x be the year.

(b) Estimate the annual chicken consumption in 2007.

58. **Relative Error** If the actual value of a quantity is A and its measured value is M , then the relative error in measurement M is $|\frac{M-A}{A}|$. If $A = 65$, determine the range of values for M to have a relative error that is less than or equal to 0.03 (3%).

59. The table lists per capita income.

Year	1970	1980	1990	2000
Income	\$4095	\$10,183	\$19,572	\$29,760

Source: Bureau of Economic Analysis.

-  (a) Find the least-squares regression line for the data.
- (b) Estimate the per capita income in 1995. Did this calculation involve interpolation or extrapolation?

60. **Modeling Data** According to government guidelines, the recommended minimum weight for a person 58 inches tall is 91 pounds, and for a person 64 inches tall it is 111 pounds.

- (a) Find an equation of the line that passes through the points (58, 91) and (64, 111).
- (b) Use this line to estimate the minimum weight for someone 61 inches tall. Then use the midpoint formula to find this minimum weight. Are the results the same? Why?

Quadratic Functions and Equations

3

The last basketball player in the NBA to shoot foul shots underhand was Rick Barry, who retired in 1980. On average, he was able to make about 9 out of 10 shots. Since then, every NBA player has used the overhand style of shooting foul shots—even though this style has often resulted in lower free-throw percentages.

According to Dr. Peter Brancazio, a physics professor emeritus from Brooklyn College and author of *Sports Science*, there are good reasons for shooting underhand. An underhand shot obtains a higher arc, and as the ball approaches the hoop, it has a better chance of going through the hoop than does a ball with a flatter arc. If a basketball is tossed at an angle of 32 degrees or less, it will likely hit the back of the rim and bounce out. The optimal angle is greater than 45 degrees and depends on the height at which the ball is released. Lower release points require steeper arcs and increase the chances of the ball passing through the hoop. (See the Extended and Discovery Exercise at the end of this chapter to model the arc of a basketball.)

Mathematics plays an important role in analyzing applied problems such as shooting foul shots. Whether NBA players choose to listen to Professor Brancazio is another question, but mathematics tells us that steeper arcs are necessary for accurate foul shooting.

Rick Barry

The work of mathematicians from even a millennium ago is still routinely used today, and the work of mathematicians from today will be part of the math of the future.

—Terry Tao, Fields Medal 2006

3.1 Quadratic Functions and Models

- Learn basic concepts about quadratic functions and their graphs
- Complete the square and apply the vertex formula
- Graph a quadratic function by hand
- Solve applications and model data
- ✱ Use quadratic regression to model data (optional)

Introduction

Sometimes when data lie on a line or nearly lie on a line, they can be modeled with a linear function ($f(x) = ax + b$) and are called *linear data*. Data that are not linear are called **nonlinear data** and must be modeled with a nonlinear function. There are many types of nonlinear data, and mathematicians can choose from a wide variety of nonlinear functions to create models. One of the simplest types of nonlinear functions is a *quadratic function*, which can be used to model the flight of a baseball, AIDS in America, or an athlete's heart rate. Figures 3.1–3.3 illustrate three sets of nonlinear data that can be modeled by a quadratic function. Although the complete graph of a quadratic function is either U-shaped or \cap -shaped, we often use only one side or a portion of the graph to model real-world data.

Figure 3.1

Figure 3.2

Figure 3.3

Basic Concepts

The formula for a quadratic function is different from that of a linear function because it contains an x^2 -term. Examples of quadratic functions include

$$f(x) = 2x^2 - 4x - 1, \quad g(x) = 4 - x^2, \quad \text{and} \quad h(x) = \frac{1}{3}x^2 + \frac{2}{3}x + 1.$$

The following box defines a *general form* for a quadratic function.

Quadratic Function

Let a , b , and c be constants with $a \neq 0$. A function represented by

$$f(x) = ax^2 + bx + c$$

is a **quadratic function**.

The domain of a quadratic function includes *all* real numbers. The leading coefficient of a quadratic function is a . For the previous three functions f , g , and h , the leading coefficients are $a = 2$ for $f(x) = 2x^2 - 4x - 1$, $a = -1$ for $g(x) = 4 - 1x^2$, and $a = \frac{1}{3}$ for $h(x) = \frac{1}{3}x^2 + \frac{2}{3}x + 1$.

The graph of a quadratic function is a **parabola**—a U-shaped graph that opens either upward or downward. Graphs of the three quadratic functions f , g , and h are shown in Figures 3.4–3.6, respectively. A parabola opens upward if a is positive and opens downward if a is negative. For example, since $a = -1$ for $g(x) = 4 - x^2$, the graph of g opens downward. The highest point on a parabola that opens downward or the lowest point on a parabola that opens upward is called the **vertex**. The vertical line passing through the vertex is called the **axis of symmetry**. The vertex and axis of symmetry are shown in each figure. Function f increases for $x \geq 1$ and decreases for $x \leq 1$, whereas function g increases for $x \leq 0$ and decreases for $x \geq 0$. Remember to move from left to right along the graph when determining where a function is increasing or decreasing. (See Section 1.5.)

Figure 3.4

Figure 3.5

Figure 3.6

The leading coefficient a of a quadratic function not only determines whether its graph opens upward or downward, but also controls the width of the parabola. Larger values of $|a|$ result in a narrower parabola, and smaller values of $|a|$ result in a wider parabola. This concept is illustrated in Figures 3.7 and 3.8.

Figure 3.7 $y = ax^2, a > 0$ Figure 3.8 $y = ax^2, a < 0$

CLASS DISCUSSION

What does the graph of a quadratic function resemble if its leading coefficient is nearly 0?

EXAMPLE 1 Identifying quadratic functions

Identify the function as linear, quadratic, or neither. If it is quadratic, identify the leading coefficient and evaluate the function at $x = 2$.

- (a) $f(x) = 3 - 2^2x$ (b) $g(x) = 5 + x - 3x^2$ (c) $h(x) = \frac{3}{x^2 + 1}$

SOLUTION

Getting Started The formula for a quadratic function always has an x^2 -term and may have an x -term and a constant. It does not have a variable raised to any other power or a variable in a denominator. ►

- (a) Because $f(x) = 3 - 2^2x$ can be written as $f(x) = -4x + 3$, f is linear.
 (b) Because $g(x) = 5 + x - 3x^2$ can be written as $g(x) = -3x^2 + x + 5$, g is a quadratic function with $a = -3$, $b = 1$, and $c = 5$. The leading coefficient is $a = -3$ and

$$g(2) = 5 + 2 - 3(2)^2 = -5.$$

- (c) $h(x) = \frac{3}{x^2 + 1}$ cannot be written as $h(x) = ax + b$ or as $h(x) = ax^2 + bx + c$, so h is neither a linear nor a quadratic function. Now Try Exercises 1, 3, and 5 ◀

EXAMPLE 2**Analyzing graphs of quadratic functions**

Use the graph of each quadratic function to determine the sign of the leading coefficient a , the vertex, and the equation of the axis of symmetry. Give the intervals where the function is increasing and where it is decreasing.

Figure 3.9

Figure 3.10

SOLUTION

- (a) The graph of f in Figure 3.9 opens upward, so a is positive. The vertex is the lowest point on the graph and is $(1, -2)$. The axis of symmetry is a vertical line passing through the vertex with equation $x = 1$. Function f increases to the right of the vertex and decreases to the left of the vertex. Thus f is increasing for $x \geq 1$ and decreasing for $x \leq 1$.
 (b) The graph of g in Figure 3.10 opens downward, so a is negative. The vertex is $(-2, 5)$, and the axis of symmetry is given by $x = -2$. Function g is increasing for $x \leq -2$ and decreasing for $x \geq -2$. Now Try Exercises 7 and 9 ◀

Completing the Square and the Vertex Formula

When a quadratic function f is expressed as $f(x) = ax^2 + bx + c$, the coordinates of the vertex are not apparent. However, if f is written as $f(x) = a(x - h)^2 + k$, then the vertex

is located at (h, k) , as illustrated in Figure 3.11. For example, in Figure 3.12 the graph of $f(x) = -2(x - 1)^2 + 2$ opens downward with vertex $(1, 2)$.

Figure 3.11 A Parabola with Vertex (h, k)

Figure 3.12 A Parabola with Vertex $(1, 2)$

To justify that the vertex is indeed (h, k) , consider the following. If $a > 0$ in the form $f(x) = a(x - h)^2 + k$, then the term $a(x - h)^2$ is never negative and the minimum value of $f(x)$ is k . This value occurs when $x = h$ because

$$f(h) = a(h - h)^2 + k = 0 + k = k.$$

Thus the lowest point on the graph of $f(x) = a(x - h)^2 + k$ with $a > 0$ is (h, k) , and because this graph is a parabola that opens upward, the vertex must be (h, k) . A similar discussion can be used to justify that (h, k) is the vertex when $a < 0$.

The formula $f(x) = a(x - h)^2 + k$ is sometimes called the **standard form for a parabola with a vertical axis**. Because the vertex is apparent in this formula, we will call it simply the **vertex form**.

Vertex Form

The parabolic graph of $f(x) = a(x - h)^2 + k$ with $a \neq 0$ has vertex (h, k) . Its graph opens upward when $a > 0$ and opens downward when $a < 0$.

EXAMPLE 1 Converting to $f(x) = ax^2 + bx + c$

Write $f(x) = 2(x - 1)^2 + 4$ in the form $f(x) = ax^2 + bx + c$.

SOLUTION Begin by expanding the expression $(x - 1)^2$.

$$\begin{aligned} 2(x - 1)^2 + 4 &= 2(x^2 - 2x + 1) + 4 && \text{Square binomial.} \\ &= 2x^2 - 4x + 2 + 4 && \text{Distributive property} \\ &= 2x^2 - 4x + 6 && \text{Add terms.} \end{aligned}$$

Thus $f(x) = 2x^2 - 4x + 6$.

Now Try Exercise 15 ◀

The next example illustrates how to determine the vertex form given the graph of a parabola.

Algebra Review

To review squaring a binomial, see Chapter R (page R-18).

Figure 3.13

EXAMPLE 4 Writing the equation of a parabola

Find the vertex form for the graph shown in Figure 3.13.

SOLUTION

Getting Started We must determine a , h , and k in $f(x) = a(x - h)^2 + k$. The coordinates of the vertex correspond to the values of h and k . To find a , substitute the coordinates of a point on the graph in the equation and solve for a . ▶

From Figure 3.13, the vertex is $(2, 3)$. Thus $h = 2$ and $k = 3$ and $f(x) = a(x - 2)^2 + 3$. The point $(0, 1)$ lies on the graph, so $f(0) = 1$. (Any point on the graph of f other than the vertex could be used.)

$$\begin{aligned} f(x) &= a(x - 2)^2 + 3 && \text{Vertex form} \\ 1 &= a(0 - 2)^2 + 3 && \text{Let } x = 0 \text{ and } f(0) = 1. \text{ Solve for } a. \\ 1 &= 4a + 3 && \text{Simplify.} \\ -2 &= 4a && \text{Subtract 3 from each side.} \\ a &= -\frac{1}{2} && \text{Divide by 4 and rewrite equation.} \end{aligned}$$

$$\text{Thus } f(x) = -\frac{1}{2}(x - 2)^2 + 3.$$

Now Try Exercise 25 ◀

Completing the Square We can convert the general form $f(x) = ax^2 + bx + c$ to vertex form by **completing the square**. If a quadratic expression can be written as $x^2 + kx + \left(\frac{k}{2}\right)^2$, then it is a perfect square trinomial and can be factored as

$$x^2 + kx + \left(\frac{k}{2}\right)^2 = \left(x + \frac{k}{2}\right)^2.$$

Note that the k used to complete the square is different from the k found in the vertex form. In general, a variable can have different meanings in different situations.

This technique of converting to vertex form by completing the square is illustrated in the next example.

EXAMPLE 5 Converting to vertex form

Write each formula in vertex form by completing the square.

$$\text{(a) } f(x) = x^2 + 6x - 3 \qquad \text{(b) } f(x) = \frac{1}{3}x^2 - x + 2$$

SOLUTION

(a) Start by letting $y = f(x)$.

$$\begin{aligned} y &= x^2 + 6x - 3 && \text{Given formula} \\ y + 3 &= x^2 + 6x && \text{Add 3 to each side.} \\ y + 3 + 9 &= x^2 + 6x + 9 && \text{Let } k = 6; \text{ add } \left(\frac{k}{2}\right)^2 = \left(\frac{6}{2}\right)^2 = 9. \\ y + 12 &= (x + 3)^2 && \text{Factor perfect square trinomial.} \\ y &= (x + 3)^2 - 12 && \text{Subtract 12.} \end{aligned}$$

The required form is $f(x) = (x + 3)^2 - 12$.

Algebra Review

To review perfect square trinomials, see Chapter R (page R-26).

(b) Start by letting $y = f(x)$.

$$y = \frac{1}{3}x^2 - x + 2$$

Given formula

$$3y = x^2 - 3x + 6$$

Make leading coefficient 1.

$$3y - 6 = x^2 - 3x$$

Subtract 6 from each side.

$$3y - 6 + \frac{9}{4} = x^2 - 3x + \frac{9}{4}$$

Let $k = -3$; add $\left(\frac{k}{2}\right)^2 = \left(\frac{-3}{2}\right)^2 = \frac{9}{4}$.

$$3y - \frac{15}{4} = \left(x - \frac{3}{2}\right)^2$$

Factor perfect square trinomial.

$$3y = \left(x - \frac{3}{2}\right)^2 + \frac{15}{4}$$

Add $\frac{15}{4}$ to each side.

$$y = \frac{1}{3}\left(x - \frac{3}{2}\right)^2 + \frac{5}{4}$$

Multiply each side by $\frac{1}{3}$.

The required form is $f(x) = \frac{1}{3}\left(x - \frac{3}{2}\right)^2 + \frac{5}{4}$.

Now Try Exercises 29 and 35 ◀

Derivation of the Vertex Formula The above procedure of completing the square can be done in general to derive a formula for determining the vertex of any parabola.

$$y = ax^2 + bx + c$$

General equation for a parabola

$$\frac{y}{a} = x^2 + \frac{b}{a}x + \frac{c}{a}$$

Divide each side by a to make leading coefficient 1.

$$\frac{y}{a} - \frac{c}{a} = x^2 + \frac{b}{a}x$$

Subtract $\frac{c}{a}$ from each side.

$$\frac{y}{a} - \frac{c}{a} + \frac{b^2}{4a^2} = x^2 + \frac{b}{a}x + \frac{b^2}{4a^2}$$

Add $\left(\frac{b/a}{2}\right)^2 = \frac{b^2}{4a^2}$.

$$\frac{y}{a} + \frac{b^2 - 4ac}{4a^2} = \left(x + \frac{b}{2a}\right)^2$$

Combine left terms; factor perfect square trinomial.

$$\frac{y}{a} = \left(x + \frac{b}{2a}\right)^2 - \frac{b^2 - 4ac}{4a^2}$$

Isolate y -term on the left side.

$$y = a\left(x + \frac{b}{2a}\right)^2 - \frac{b^2 - 4ac}{4a}$$

Multiply by a .

$$y = a\left(x - \underbrace{\left(-\frac{b}{2a}\right)}_h\right)^2 + \underbrace{\frac{4ac - b^2}{4a}}_k$$

Write $y = a(x - h)^2 + k$.

Because the coordinates of the vertex are (h, k) , the x -coordinate is $-\frac{b}{2a}$. Note that it is *not* necessary to memorize the expression for k , because the y -coordinate can be found by evaluating $y = f(x)$ for $x = -\frac{b}{2a}$. This derivation of the *vertex formula* is now summarized.

Vertex Formula

The vertex of the graph of $f(x) = ax^2 + bx + c$ with $a \neq 0$ is the point $\left(-\frac{b}{2a}, f\left(-\frac{b}{2a}\right)\right)$.

NOTE If a parabola has two x -intercepts, then the x -coordinate of the vertex is equal to the midpoint of these two x -intercepts. For example, the x -intercepts in Figure 3.9 on page 172 are -1 and 3 . Their midpoint is $\frac{-1+3}{2} = 1$, which is the x -coordinate of the vertex.

EXAMPLE 6 Using the vertex formula

Find the vertex of the graph of $f(x) = 1.5x^2 - 6x + 4$ symbolically. Find the intervals where f is increasing and where f is decreasing. Support your answer graphically and numerically.

SOLUTION

Symbolic If $f(x) = 1.5x^2 - 6x + 4$, then the x -coordinate of the vertex is

$$x = -\frac{b}{2a} = -\frac{(-6)}{2(1.5)} = 2. \quad \text{Let } a = 1.5 \text{ and } b = -6.$$

The y -coordinate of the vertex can be found by evaluating $f(2)$.

$$y = f(2) = 1.5(2)^2 - 6(2) + 4 = -2.$$

Thus the vertex is $(2, -2)$. The graph of f is \cup -shaped, so it is increasing for $x \geq 2$ and decreasing for $x \leq 2$. See Figure 3.14.

Graphical This result can be supported by graphing $Y_1 = 1.5X^2 - 6X + 4$, as shown in Figure 3.14. The vertex is the lowest point on the graph.

Calculator Help

To find a minimum point on a graph, see Appendix A (page AP-10).

Figure 3.14

Figure 3.15

Numerical Numerical support is shown in Figure 3.15. The minimum y -value of -2 occurs when $x = 2$. Notice that if we move an equal distance left or right of the axis of symmetry, the y -values are equal. For example, when $x = 1$ or $x = 3$, $y_1 = -0.5$. Similarly, when $x = 0$ or $x = 4$, $y_1 = 4$.

Now Try Exercise 45

EXAMPLE 7 Converting to $f(x) = a(x - h)^2 + k$

Use the vertex formula to write $f(x) = 3x^2 + 12x + 7$ in vertex form.

SOLUTION Begin by finding the vertex. Let $a = 3$ and $b = 12$.

$$x = -\frac{b}{2a} = -\frac{12}{2(3)} = -2$$

Since $f(-2) = 3(-2)^2 + 12(-2) + 7 = -5$, the vertex is $(-2, -5)$. Because $a = 3$, $f(x)$ can be written as $f(x) = 3(x + 2)^2 - 5$.

Now Try Exercise 37

Graphing Quadratic Functions When sketching a parabola, it is important to determine the vertex, the axis of symmetry, and whether the parabola opens upward or downward. In the next example we sketch the graphs of two quadratic functions by hand.

EXAMPLE 2 Graphing quadratic functions by hand

Graph each quadratic function.

(a) $g(x) = 2(x - 1)^2 - 3$ (b) $h(x) = -\frac{1}{2}x^2 - x + 2$

SOLUTION

- (a) The vertex is $(1, -3)$ and the axis of symmetry is $x = 1$. The parabola opens upward because $a = 2$ is positive. In Table 3.1 we list the vertex and a few other points located on either side of the vertex. Note the symmetry of the y -values on each side of the vertex. These points and a smooth U-shaped curve are plotted in Figure 3.16. When $x = 0$, $y = -1$, and so the y -intercept is -1 .

Table 3.1

x	y
-1	5
0	-1
1	-3
2	-1
3	5

Vertex \rightarrow (1, -3) Equal

Figure 3.16

- (b) The given formula is not in vertex form, but we can find the vertex.

$$x = -\frac{b}{2a} = -\frac{-1}{2(-\frac{1}{2})} = -1$$

The y -coordinate of the vertex is $h(-1) = -\frac{1}{2}(-1)^2 - (-1) + 2 = \frac{5}{2}$. Thus the vertex is $(-1, \frac{5}{2})$, the axis of symmetry is $x = -1$, and the parabola opens downward because $a = -\frac{1}{2}$ is negative. In Table 3.2 we list the vertex and a few other points located on either side of the vertex. These points and a smooth \cap -shaped curve are plotted in Figure 3.17. When $x = 0$, $y = 2$, and so the y -intercept is 2.

Table 3.2

x	y
-4	-2
-3	$\frac{1}{2}$
-2	2
-1	$\frac{5}{2}$
0	2
1	$\frac{1}{2}$
2	-2

Vertex \rightarrow $(-1, \frac{5}{2})$ Equal

Figure 3.17

Applications and Models

Sometimes when a quadratic function f is used in applications, the vertex provides important information. The reason is that the y -coordinate of the vertex is the minimum value of $f(x)$ when its graph opens upward and is the maximum value of $f(x)$ when its graph opens downward. This concept is applied in the next example.

Figure 3.18

EXAMPLE 9 Maximizing area

A rancher is fencing a rectangular area for cattle using the straight portion of a river as one side of the rectangle, as illustrated in Figure 3.18. If the rancher has 2400 feet of fence, find the dimensions of the rectangle that give the maximum area for the cattle.

SOLUTION

Getting Started Because the goal is to maximize the area, first write a formula for the area. If the formula is quadratic with $a < 0$ (parabola opening downward), then the maximum area will be the y -coordinate of the vertex. ▶

Let W be the width and L be the length of the rectangle. Because the 2400-foot fence does not go along the river, it follows that

$$W + L + W = 2400, \text{ or } L = 2400 - 2W.$$

Area A of a rectangle equals length times width, so

$$\begin{aligned} A &= LW && \text{Area of rectangle} \\ &= (2400 - 2W)W && \text{Substitute for } L. \\ &= 2400W - 2W^2. && \text{Distributive property} \end{aligned}$$

Thus the graph of $A = -2W^2 + 2400W$ is a parabola opening downward, and by the vertex formula, maximum area occurs when

$$W = -\frac{b}{2a} = -\frac{2400}{2(-2)} = 600 \text{ feet.}$$

The corresponding length is $L = 2400 - 2W = 2400 - 2(600) = 1200$ feet. The dimensions that maximize area are 600 feet by 1200 feet.

Now Try Exercise 91 ◀

Another application of quadratic functions occurs in projectile motion, such as when a baseball is hit up in the air. If air resistance is ignored, then the formula

$$s(t) = -16t^2 + v_0t + h_0$$

calculates the height s of the object above the ground in feet after t seconds. In this formula h_0 represents the initial height of the object in feet and v_0 represents its initial vertical velocity in feet per second. If the initial velocity is upward, then $v_0 > 0$, and if the initial velocity is downward, then $v_0 < 0$.

Figure 3.19

EXAMPLE 10 Modeling the flight of a baseball

A baseball is hit straight up with an initial velocity of $v_0 = 80$ feet per second (or about 55 miles per hour) and leaves the bat with an initial height of $h_0 = 3$ feet, as shown in Figure 3.19.

- (a) Write a formula $s(t)$ that models the height of the baseball after t seconds.
 (b) How high is the baseball after 2 seconds?
 (c) Find the maximum height of the baseball. Support your answer graphically.

SOLUTION

- (a) Because $v_0 = 80$ and the initial height is $h_0 = 3$,

$$s(t) = -16t^2 + v_0t + h_0 = -16t^2 + 80t + 3.$$

- (b) $s(2) = -16(2)^2 + 80(2) + 3 = 99$, so the baseball is 99 feet high after 2 seconds.
 (c) Because $a = -16$, the graph of s is a parabola opening downward. The vertex is the highest point on the graph, with a t -coordinate of

$$t = -\frac{b}{2a} = -\frac{80}{2(-16)} = 2.5.$$

The corresponding y -coordinate of the vertex is

$$s(2.5) = -16(2.5)^2 + 80(2.5) + 3 = 103 \text{ feet.}$$

Thus the vertex is $(2.5, 103)$ and the maximum height of the baseball is 103 feet after 2.5 seconds. Graphical support is shown in Figure 3.20, where $Y_1 = -16X^2 + 80X + 3$ and the vertex is located at $(2.5, 103)$.

Now Try Exercise 87 ◀

$[0, 5, 1]$ by $[-20, 120, 20]$

Figure 3.20

Calculator Help

To find a maximum point on a graph, see Appendix A (page AP-10).

Figure 3.21

Table 3.3 Athlete's Heart Rate

Time (min)	0	2	4	6	8
Heart rate (bpm)	200	150	110	90	80

Adapted from: V. Thomas, *Science and Sport*.

The data are not linear because for each 2-minute interval the heart rate does not decrease by a fixed amount. In Figure 3.21 the data are modeled with a nonlinear function. Note that the graph of this function resembles the left half of a parabola that opens upward.

EXAMPLE 11 Modeling an athlete's heart rate

Find a quadratic function f expressed in vertex form that models the data in Table 3.3. Support your result by graphing f and the data together. What is the domain of your function?

SOLUTION To model the data we use the left half of a parabola. Since the minimum heart rate of 80 beats per minute occurs when $x = 8$, let $(8, 80)$ be the vertex and write

$$f(x) = a(x - 8)^2 + 80.$$

Next we must determine a value for the leading coefficient a . One possibility is to have the graph of f pass through the first data point $(0, 200)$, or equivalently, let $f(0) = 200$.

Table 3.3 Athlete's Heart Rate (repeated)

Time (min)	Heart rate (bpm)
0	200
2	150
4	110
6	90
8	80

Adapted from: V. Thomas, *Science and Sport*.

$$f(0) = 200$$

$$a(0 - 8)^2 + 80 = 200$$

$$a(0 - 8)^2 = 120$$

$$a = \frac{120}{64}$$

$$a = 1.875$$

Have the graph pass through $(0, 200)$.

Let $x = 0$ in $f(x)$. Solve for a .

Subtract 80.

Divide by $(0 - 8)^2 = 64$.

Write as a decimal.

Thus $f(x) = 1.875(x - 8)^2 + 80$ can be used to model the athlete's heart rate. A graph of f and the data are shown in Figure 3.22, which is similar to Figure 3.21. Figure 3.23 shows a table of $Y_1 = 1.875(X - 8)^2 + 80$. Although the table in Figure 3.23 does not match Table 3.3 (repeated in the margin) exactly, it gives reasonable approximations. (Note that formulas for $f(x)$ may vary. For example, if we had selected the point $(2, 150)$ rather than $(0, 200)$, then $a \approx 1.94$. You may wish to verify this result.)

The domain D of $f(x) = 1.875(x - 8)^2 + 80$ needs to be restricted to $0 \leq x \leq 8$ because this interval corresponds to the domain of the data in Table 3.3.

Calculator Help

To create a table similar to Figure 3.23, see Appendix A (page AP-10).

MAKING CONNECTIONS

General Form, Vertex Form, and Modeling When modeling quadratic data by hand, it is often easier to use the vertex form, $f(x) = a(x - h)^2 + k$, rather than the general form, $f(x) = ax^2 + bx + c$. Because (h, k) corresponds to the vertex of a parabola, it may be appropriate to let (h, k) correspond to either the highest data point or the lowest data point in the scatterplot. Then a value for a can be found by substituting a data point into the formula for $f(x)$. In the next subsection least-squares regression provides a quadratic modeling function in general form.

Quadratic Regression (Optional)

In Chapter 2 we discussed how a regression line could be found by the method of least squares. This method can also be applied to quadratic data; the process is illustrated in the next example.

EXAMPLE 12 Finding a quadratic regression model

In one study the efficiency of photosynthesis in an Antarctic species of grass was investigated. Table 3.4 lists results for various temperatures. The temperature x is in degrees Celsius and the efficiency y is given as a percent. The purpose of the research was to determine the temperature at which photosynthesis is most efficient. (Source: D. Brown and P. Rothery, *Models in Biology: Mathematics, Statistics and Computing*.)

Table 3.4 Efficiency of Photosynthesis

x ($^{\circ}\text{C}$)	-1.5	0	2.5	5	7	10	12	15	17	20	22	25	27	30
y (%)	33	46	55	80	87	93	95	91	89	77	72	54	46	34

- (a) Plot the data. Discuss reasons why a quadratic function might model the data.
 (b) Find a least-squares function f given by $f(x) = ax^2 + bx + c$ that models the data.
 (c) Graph f and the data in $[-5, 35, 5]$ by $[20, 110, 10]$. Discuss the fit.
 (d) Determine the temperature at which f predicts that photosynthesis is most efficient. Compare the results with the findings of the experiment.

SOLUTION

- (a) A plot of the data is shown in Figure 3.24. The y -values first increase and then decrease as the temperature x increases. The data suggest a parabolic shape opening downward.
 (b) Enter the data into your calculator, and then select quadratic regression from the menu, as shown in Figure 3.25 and Figure 3.26. In Figure 3.27 the modeling function f is given (approximately) by $f(x) = -0.249x^2 + 6.77x + 46.37$.

$[-5, 35, 5]$ by $[20, 110, 10]$

$c = 46.37050717$
$R^2 = .956006327$

Figure 3.27

Calculator Help

To find an equation of least-squares fit, see Appendix A (page AP-11).

- (c) The graph of $Y_1 = -.249X^2 + 6.77X + 46.37$ with the data is shown in Figure 3.28. Although the model is not exact, the parabola describes the general trend in the data. The parabola opens downward because $a = -0.249$.
 (d) The vertex is the highest point on the graph, located at approximately $(13.6, 92.4)$. See Figure 3.29. This model predicts that the highest efficiency is about 92.4%, and it occurs near 13.6°C . Although there are percentages in the table higher than 92.4%, 13.6°C is a reasonable estimate for the optimum temperature. The function f is attempting to model the general trend in the data and predict future results.

3.1 Putting It All Together

The following table summarizes some important topics from this section.

Concept	Symbolic Representation	Comments and Examples
Quadratic function	$f(x) = ax^2 + bx + c$, where a , b , and c are constants with $a \neq 0$ (general form)	It models data that are not linear. Its graph is a parabola (U-shaped) that opens either upward ($a > 0$) or downward ($a < 0$).
Parabola	The graph of $y = ax^2 + bx + c$, $a \neq 0$, is a parabola.	 <p>Vertex: (h, k); axis of symmetry: $x = h$ Maximum (or minimum) y-value: k</p>
Completing the square to find vertex form	To complete the square for $x^2 + kx$, add $\left(\frac{k}{2}\right)^2$ to make a perfect square trinomial.	$y = x^2 - 2x + 3$ $y - 3 = x^2 - 2x \quad k = -2$ $y - 3 + 1 = x^2 - 2x + 1 \quad \text{Add } \left(\frac{-2}{2}\right)^2 = 1.$ $y - 2 = (x - 1)^2$ $y = (x - 1)^2 + 2$
Vertex formula	The vertex for $f(x) = ax^2 + bx + c$ is the point $\left(-\frac{b}{2a}, f\left(-\frac{b}{2a}\right)\right)$.	<p>If $f(x) = x^2 - 2x + 3$, then</p> $x = \frac{-2}{2(1)} = 1.$ <p>y-value of vertex: $f(1) = 2$ Vertex: $(1, 2)$; axis of symmetry: $x = 1$</p>
Vertex form (standard form for a parabola with vertical axis)	The vertex form for a quadratic function is $f(x) = a(x - h)^2 + k$, with vertex (h, k) .	<p>Let $f(x) = 2(x + 3)^2 - 5$. Parabola opens upward: $a > 0$ $a = 2$ Vertex: $(-3, -5)$ Axis of symmetry: $x = -3$ Minimum y-value on graph: -5</p>

3.1 Exercises

Basics of Quadratic Functions

Exercises 1–6: Identify f as being linear, quadratic, or neither. If f is quadratic, identify the leading coefficient a and evaluate $f(-2)$.

1. $f(x) = 1 - 2x + 3x^2$ 2. $f(x) = -5x + 11$

3. $f(x) = \frac{1}{x^2 - 1}$ 4. $f(x) = (x^2 + 1)^2$

5. $f(x) = \frac{1}{2} - \frac{3}{10}x$ 6. $f(x) = \frac{1}{5}x^2$

Exercises 7–10: Use the graph to find the following.

- Sign of the leading coefficient
- Vertex
- Axis of symmetry
- Intervals where f is increasing and where f is decreasing

Exercises 11–14: The formulas for $f(x)$ and $g(x)$ are identical except for their leading coefficients a . Compare the graphs of f and g . You may want to support your answers by graphing f and g together.

11. $f(x) = x^2$, $g(x) = 2x^2$

12. $f(x) = \frac{1}{2}x^2$, $g(x) = -\frac{1}{2}x^2$

13. $f(x) = 2x^2 + 1$, $g(x) = -\frac{1}{3}x^2 + 1$

14. $f(x) = x^2 + x$, $g(x) = \frac{1}{4}x^2 + x$

Vertex Formula

Exercises 15–20: Identify the vertex and leading coefficient. Then write the expression as $f(x) = ax^2 + bx + c$.

15. $f(x) = -3(x - 1)^2 + 2$

16. $f(x) = 5(x + 2)^2 - 5$

17. $f(x) = 5 - 2(x - 4)^2$ 18. $f(x) = \frac{1}{2}(x + 3)^2 - 5$

19. $f(x) = \frac{3}{4}(x + 5)^2 - \frac{7}{4}$ 20. $f(x) = -5(x - 4)^2$

Exercises 21–28: Use the graph of the quadratic function f to write its formula as $f(x) = a(x - h)^2 + k$.

27.

28.

Exercises 29–40: Write the given expression in the form $f(x) = a(x - h)^2 + k$. Identify the vertex.

29. $f(x) = x^2 + 4x - 5$ 30. $f(x) = x^2 + 10x + 7$

31. $f(x) = x^2 - 3x$ 32. $f(x) = x^2 - 7x + 5$

33. $f(x) = 2x^2 - 5x + 3$ 34. $f(x) = 3x^2 + 6x + 2$

35. $f(x) = \frac{1}{3}x^2 + x + 1$ 36. $f(x) = -\frac{1}{2}x^2 - \frac{3}{2}x + 1$

37. $f(x) = 2x^2 - 8x - 1$ 38. $f(x) = -\frac{1}{2}x^2 - x$

39. $f(x) = 2 - 9x - 3x^2$

40. $f(x) = 6 + 5x - 10x^2$

Exercises 41–52: Complete the following.

(a) Use the vertex formula to find the vertex.

(b) Find the intervals where f is increasing and where f is decreasing.

41. $f(x) = 6 - x^2$ 42. $f(x) = 2x^2 - 2x + 1$

43. $f(x) = x^2 - 6x$ 44. $f(x) = -2x^2 + 4x + 5$

45. $f(x) = 2x^2 - 4x + 1$ 46. $f(x) = -3x^2 + x - 2$

47. $f(x) = \frac{1}{2}x^2 + 10$ 48. $f(x) = \frac{9}{10}x^2 - 12$

49. $f(x) = -\frac{3}{4}x^2 + \frac{1}{2}x - 3$ 50. $f(x) = -\frac{4}{5}x^2 - \frac{1}{5}x + 1$

51. $f(x) = 1.5 - 3x - 6x^2$ 52. $f(x) = -4x^2 + 16x$

Graphing Quadratic Functions

Exercises 53–72: Sketch a graph of f .

53. $f(x) = x^2$ 54. $f(x) = -2x^2$

55. $f(x) = -\frac{1}{2}x^2$ 56. $f(x) = 4 - x^2$

57. $f(x) = x^2 - 3$ 58. $f(x) = x^2 + 2$

59. $f(x) = (x - 2)^2 + 1$ 60. $f(x) = (x + 1)^2 - 2$

61. $f(x) = -3(x + 1)^2 + 3$ 62. $f(x) = -2(x - 1)^2 + 1$

63. $f(x) = x^2 - 2x - 2$ 64. $f(x) = x^2 - 4x$

65. $f(x) = -x^2 + 4x - 2$ 66. $f(x) = -x^2 + 2x + 1$

67. $f(x) = 2x^2 - 4x - 1$ 68. $f(x) = 3x^2 + 6x$

69. $f(x) = -3x^2 - 6x + 1$ 70. $f(x) = -2x^2 + 4x - 1$

71. $f(x) = -\frac{1}{2}x^2 + x + 1$ 72. $f(x) = \frac{1}{2}x^2 - 2x + 2$

Exercises 73 and 74: **Average Rate of Change** Find the average rate of change of f from 1 to 3.

73. $f(x) = -3x^2 + 5x$ 74. $f(x) = 4x^2 - 3x + 1$

Exercises 75 and 76: **Difference Quotient** Find the difference quotient of f .

75. $f(x) = 3x^2 - 2x$ 76. $f(x) = 5 - 4x^2$

Exercises 77 and 78: Find the formula for a quadratic function that satisfies the given conditions.

77. Axis of symmetry $x = 3$, passing through the points (3, 1) and (1, 9)

78. Vertex (-3, 4), passing through (-2, 1)

Graphs and Models

Exercises 79–82: Match the situation with the graph of the quadratic function (a–d) that models it best.

79. The height y of a stone thrown from ground level after x seconds

80. The number of people attending a popular movie x weeks after its opening

81. The temperature after x hours in a house where the furnace quits and a repairperson fixes it

82. The cumulative number of reported AIDS cases in year x , where $1982 \leq x \leq 1994$

Applications and Models

- 83. Maximizing Area** A farmer has 1000 feet of fence to enclose a rectangular area. What dimensions for the rectangle result in the maximum area enclosed by the fence?
- 84. Maximizing Area** A homeowner has 80 feet of fence to enclose a rectangular garden. What dimensions for the garden give the maximum area?
- 85. Maximizing Revenue** Suppose the revenue R in thousands of dollars that a company receives from producing x thousand compact disc players is given by the formula $R(x) = x(40 - 2x)$.
- Evaluate $R(2)$ and interpret the result.
 - How many CD players should the company produce to maximize its revenue?
 - What is the maximum revenue?
- 86. Maximizing Revenue** A large hotel is considering giving the following group discount on room rates: the regular price of \$120 decreases by \$2 for each room rented. For example, one room costs \$118, two rooms cost $116 \times 2 = \$232$, three rooms cost $114 \times 3 = \$342$, and so on.
- Write a formula for a function R that gives the revenue for renting x rooms.
 - Sketch a graph of R . What is a reasonable domain?
 - Determine the maximum revenue and the corresponding number of rooms rented.
- 87. Hitting a Baseball** A baseball is hit so that its height in feet after t seconds is $s(t) = -16t^2 + 44t + 4$.
- How high is the baseball after 1 second?
 - Find the maximum height of the baseball. Support your answer graphically.
- 88. Flight of a Baseball** (Refer to Example 10.) A baseball is hit straight up with an initial velocity of $v_0 = 96$ feet per second (about 65 miles per hour) and leaves the bat with an initial height of $h_0 = 2.5$ feet.
- Write a formula $s(t)$ that models the height after t seconds.
 - How high is the baseball after 4 seconds?
 - Find the maximum height of the baseball. Support your answer graphically.

- 89. Throwing a Stone** (Refer to Example 10.) A stone is thrown *downward* with a velocity of 66 feet per second (45 miles per hour) from a bridge that is 120 feet above a river, as illustrated in the figure.
- Write a formula $s(t)$ that models the height of the stone after t seconds.
 - Does the stone hit the water within the first 2 seconds? Explain.

- 90. Hitting a Golf Ball** A golf ball is hit so that its height h in feet after t seconds is $h(t) = -16t^2 + 60t$.
- What is the initial height of the golf ball?
 - How high is the golf ball after 1.5 seconds?
 - Find the maximum height of the golf ball.
- 91. Maximizing Area** (Refer to Example 9.) A farmer wants to fence a rectangular area by using the wall of a barn as one side of the rectangle and then enclosing the other three sides with 160 feet of fence. Find the dimensions of the rectangle that give the maximum area inside.
- 92. Maximizing Area** A rancher plans to fence a rectangular area for cattle using the straight portion of a river as one side of the rectangle. If the farmer has P feet of fence, find the dimensions of the rectangle that give the maximum area for the cattle.

Exercises 93–96: Maximizing Altitude If air resistance is ignored, the height h of a projectile above the ground after x seconds is given by $h(x) = -\frac{1}{2}gx^2 + v_0x + h_0$, where g is the acceleration due to gravity. This formula is also valid for other celestial bodies. Suppose a ball is thrown straight up at 88 feet per second from a height of 25 feet.

- For the given g , graphically estimate both the maximum height and the time when it occurs.
- Solve part (a) symbolically.

- 93.** $g = 32$ (Earth) **94.** $g = 5.1$ (Moon)
- 95.** $g = 13$ (Mars) **96.** $g = 88$ (Jupiter)

Exercises 97 and 98: Find $f(x) = a(x - h)^2 + k$ so that f models the data exactly.

97.

x	-1	0	1	2	3
y	5	-1	-3	-1	5

98.

x	-2	-1	0	1	2
y	2	4	2	-4	-14

99. **Suspension Bridge** The cables that support a suspension bridge, such as the Golden Gate Bridge, can be modeled by parabolas. Suppose that a 300-foot-long suspension bridge has at its ends towers that are 120 feet tall, as shown in the figure. If the cable comes within 20 feet of the road at the center of the bridge, find a function that models the height of the cable above the road a distance of x feet from the center of the bridge.

100. **Suspension Bridge** Repeat Exercise 99 for a suspension bridge that has 100-foot towers, a length of 200 feet, and a cable that comes within 15 feet of the road at the center of the bridge.

101. **Heart Rate** The table shows the heart rate of an athlete upon stopping a moderate activity.

Time (min)	0	1	2	3	4
Heart rate (bpm)	122	108	98	92	90

- (a) Model the data with $H(t) = a(t - h)^2 + k$. What is the domain of H ?
- (b) Approximate the athlete's heart rate for $t = 1.5$ minutes.

102. **Heart Rate** The heart rate of an athlete while weight training is recorded for 4 minutes. The table lists the heart rate after x minutes.

Time (min)	0	1	2	3	4
Heart rate (bpm)	84	111	120	110	85

- (a) Explain why the data are not linear.
- (b) Find a quadratic function f that models the data.
- (c) What is the domain of your function?

Exercises 103 and 104: **AIDS in America (1982–1994)** In the early years of AIDS, the numbers of both AIDS cases and AIDS deaths could be modeled with quadratic functions. The tables list cumulative numbers for selected years.

- (a) Find a quadratic function f that models the data.
- (b) Graph the data and f together.
- (c) Evaluate $f(1991)$ and interpret the result.

103. Cumulative AIDS cases in thousands

Year	1982	1986	1990	1994
Cases	1.6	41.9	197	442

Source: Department of Health and Human Services.

104. Cumulative AIDS deaths in thousands

Year	1982	1986	1990	1994
Deaths	0.6	24.8	122	298

Source: Department of Health and Human Services.

Quadratic Regression

Exercises 105 and 106: **Quadratic Models** Use least-squares regression to find a quadratic function f that models the data given in the table. Estimate $f(3.5)$ to the nearest hundredth.

105.

x	0	2	4	6
$f(x)$	-1	16	57	124

106.

x	10	20	30	40
$f(x)$	4.2	24.3	84.1	184

107. **Household Size** The table lists the average number of people age 18 or older in a U.S. household.

Year	1940	1950	1960	1970
Household size	2.53	2.31	2.12	2.05

Year	1980	1990	2000	2006
Household size	1.97	1.93	1.93	1.92

Source: Bureau of the Census.

- (a) Find a quadratic function that models the data. Support your result graphically.
- (b) Estimate the average number of people age 18 or older in a household during 1975. Compare your estimate to the actual value of 2.01.

 **108. Consumer Price Index** The table lists the consumer price index (CPI) for selected years.

Year	1950	1960	1970	1980	1990	2000
CPI	24.1	29.6	38.8	82.4	130.7	172.2

Source: Bureau of the Census.

- (a) Find a quadratic function that models the data. Support your result graphically.
- (b) Estimate the CPI in 1995 and compare your estimate to the actual value of 152.4.

 **109. Head Start Enrollment** Head Start provides a wide range of services to children of low-income families. The table lists Head Start participation in thousands.

Year	1970	1980	1990	2006
Enrollment	447	376	541	909

Source: Department of Health and Human Services.

- (a) Find a quadratic function that models the data.
- (b) Estimate enrollment in 1985.

 **110. U.S. Population** The table lists the U.S. population P in millions for select years x .

x	1840	1880	1920	1960	2000
P	17	50	106	179	281

Source: Bureau of the Census.

- (a) Find a quadratic function that models the data.
- (b) Estimate the population in 1980 and compare your estimate with the true value of 226 million.

Writing about Mathematics

111. How do the values of a , h , and k affect the graph of $f(x) = a(x - h)^2 + k$?
112. Explain why the vertex is important when you are trying to find either the maximum y -value or the minimum y -value on the graph of a quadratic function.

EXTENDED AND DISCOVERY EXERCISES

Exercises 1–4: If data are exactly linear, the slopes (or rates of change) between consecutive data points are equal. However,

this is not true of quadratic data. Suppose that, in a table containing quadratic data, consecutive x -values increase by the same amount. Then the slopes (or average rates of change) between consecutive data points will not be equal; rather, they will increase or decrease by a constant amount. For example, the quadratic data in the following table are determined by $y = x^2 + 2$. The slopes m (or average rates of change) between consecutive data points are 2, 6, 10, and 14. Note that consecutive values for m in this list always increase by the same constant 4, indicating that the data are quadratic.

x	0	2	4	6	8
y	2	6	18	38	66

$\begin{array}{ccccccc} & & \uparrow & & \uparrow & & \uparrow & & \uparrow \\ & & m=2 & & m=6 & & m=10 & & m=14 \end{array}$

Use these concepts to determine if the data in the given table are linear, quadratic, or neither. If the data are linear or quadratic, find the next y -value in the table.

1.

x	1	2	3	4	5	6
y	-6	-9	-16	-27	-42	?

2.

x	5	10	15	20	25	30
y	9	8	7	6	5	?

3.

x	-2	0	2	4	6	8
y	-15	-7	1	18	43	?

4.

x	-4	-2	0	2	4	6
y	-9	-7	-1	9	23	?

Exercises 5–8: **Difference Quotient** Complete the following.

- (a) Evaluate $f(x)$ for each x -value in the table.

x	1	2	3	4	5
$f(x)$					

- (b) Calculate the average rate of change of f between consecutive data points in the table.
- (c) Find the difference quotient for $f(x)$. Then let $h = 1$ in the difference quotient.
- (d) Evaluate this difference quotient for $x = 1, 2, 3$, and 4. Compare these results to your results in part (b).

5. $f(x) = x^2 - 3$

6. $f(x) = 2x - x^2$

7. $f(x) = -2x^2 + 3x - 1$

8. $f(x) = 3x^2 + x + 2$

3.2 Quadratic Equations and Problem Solving

- Understand basic concepts about quadratic equations
- Use factoring, the square root property, completing the square, and the quadratic formula to solve quadratic equations
- Understand the discriminant
- Solve problems involving quadratic equations

Introduction

In Example 11 of Section 3.1 we modeled an athlete's heart rate x minutes after exercise stopped by using $f(x) = 1.875(x - 8)^2 + 80$. This vertex form can easily be changed to general form.

$$\begin{aligned} f(x) &= 1.875(x - 8)^2 + 80 && \text{Vertex form} \\ &= 1.875(x^2 - 16x + 64) + 80 && \text{Square the binomial.} \\ &= 1.875x^2 - 30x + 200 && \text{General form} \end{aligned}$$

To determine the length of time needed for the athlete's heart rate to slow from 200 beats per minute to 110 beats per minute, we can solve the *quadratic equation*

$$\begin{aligned} 1.875x^2 - 30x + 200 &= 110, \text{ or} \\ 1.875x^2 - 30x + 90 &= 0. && \text{Subtract 110 from each side.} \end{aligned}$$

(See Example 8.) A quadratic equation results when the formula for a quadratic function is set equal to a constant. Applications of quadratic functions often require solving quadratic equations.

Quadratic Equations

A quadratic equation can be defined as follows.

Quadratic Equation

A **quadratic equation** in one variable is an equation that can be written in the form

$$ax^2 + bx + c = 0,$$

where a , b , and c are constants with $a \neq 0$.

Examples of quadratic equations include

$$2x^2 - 3x - 4 = 0, \quad x^2 = 3, \quad -5x^2 + x = 0, \quad \text{and} \quad 3x + 1 = x^2.$$

Quadratic equations can have no real solutions, one real solution, or two real solutions. (Complex solutions are discussed in the next section.) Quadratic equations can be solved symbolically by a variety of methods: factoring, the square root property, completing the square, and the quadratic formula. They can also be solved graphically and numerically; however, the exact solution can *always* be obtained symbolically.

Factoring

Factoring is a common technique used to solve equations. It is based on the **zero-product property**, which states that if $ab = 0$, then $a = 0$ or $b = 0$ or both. It is important to remember that this property works only for 0. For example, if $ab = 1$, then this equation does *not* imply that either $a = 1$ or $b = 1$. For example, $a = \frac{1}{2}$ and $b = 2$ also satisfies $ab = 1$ and neither a nor b is 1.

EXAMPLE 1 Solving a quadratic equation with factoring

Solve each quadratic equation. Check your results.

(a) $2x^2 + 2x - 11 = 1$ (b) $12t^2 = t + 1$

SOLUTION(a) Start by writing the equation in the form $ax^2 + bx + c = 0$.

$$2x^2 + 2x - 11 = 1$$

Given equation

$$2x^2 + 2x - 12 = 0$$

Subtract 1 from each side.

$$x^2 + x - 6 = 0$$

Divide each side by 2 (optional step).

$$(x + 3)(x - 2) = 0$$

Factor.

$$x + 3 = 0$$

or $x - 2 = 0$

Zero-product property

$$x = -3$$

or $x = 2$

Solve.

These solutions can be checked by substituting them in the given equation.

$$2(-3)^2 + 2(-3) - 11 \stackrel{?}{=} 1$$

$$1 = 1$$

$$2(2)^2 + 2(2) - 11 \stackrel{?}{=} 1$$

$$1 = 1$$

(b) Write the equation in the form $at^2 + bt + c = 0$.

$$12t^2 = t + 1$$

Given equation

$$12t^2 - t - 1 = 0$$

Subtract t and 1.

$$(3t - 1)(4t + 1) = 0$$

Factor.

$$3t - 1 = 0$$

or $4t + 1 = 0$

Zero-product property

$$t = \frac{1}{3}$$

or

$$t = -\frac{1}{4}$$

Solve.

To check these solutions, substitute them into the given equation.

$$12\left(\frac{1}{3}\right)^2 = \frac{1}{3} + 1$$

$$\frac{4}{3} = \frac{4}{3}$$

$$12\left(-\frac{1}{4}\right)^2 = -\frac{1}{4} + 1$$

$$\frac{3}{4} = \frac{3}{4}$$

Now Try Exercises 1 and 7

We can also use factoring to find the x -intercepts of the graph of a quadratic function, because the x -intercepts of the graph of $y = ax^2 + bx + c$ correspond to the solutions to $ax^2 + bx + c = 0$.**EXAMPLE 2** Finding x -interceptsFind the exact values for the x -intercepts shown in Figure 3.30.**SOLUTION** From the graph it is difficult to determine the *exact* x -intercepts. However, they can be determined symbolically.

$$24x^2 + 7x - 6 = 0$$

Set expression equal to 0.

$$(3x + 2)(8x - 3) = 0$$

Factor.

$$3x + 2 = 0$$

or $8x - 3 = 0$

Zero-product property

$$x = -\frac{2}{3}$$

or

$$x = \frac{3}{8}$$

Solve.

The x -intercepts are $-\frac{2}{3}$ and $\frac{3}{8}$.

Now Try Exercise 29

Algebra Review

To review factoring trinomials, see Chapter R (page R-23).

Figure 3.30

Figure 3.31

EXAMPLE 4**Solving a quadratic equation symbolically, graphically, and numerically**

On the shoreline of some recreational lakes in Minnesota, the Department of Natural Resources (DNR) restricts the size of buildings. Buildings built within 100 feet of the shoreline are sometimes limited to a maximum area of 120 square feet. Suppose a rectangular shed is being built that has an area of 120 square feet and is 7 feet longer than it is wide. See Figure 3.31. Determine its dimensions symbolically, graphically, and numerically.

SOLUTION

Symbolic Solution Let x be the width of the shed. Then $x + 7$ represents the length. Since area equals width times length, we solve the following equation.

$$\begin{aligned}
 x(x + 7) &= 120 && \text{Area is equal to 120 square feet.} \\
 x^2 + 7x &= 120 && \text{Distributive property} \\
 x^2 + 7x - 120 &= 0 && \text{Subtract 120 from each side.} \\
 (x + 15)(x - 8) &= 0 && \text{Factor.} \\
 x + 15 = 0 &\quad \text{or} \quad x - 8 = 0 && \text{Zero-product property} \\
 x = -15 &\quad \text{or} \quad x = 8 && \text{Solve.}
 \end{aligned}$$

Since dimensions cannot be negative, the solution that has meaning is $x = 8$. The length is 7 feet longer than the width, so the dimensions of the shed are 8 feet by 15 feet.

Graphical Solution The *intersection-of-graphs method* can be used to solve this equation by graphing $y_1 = x(x + 7)$ and $y_2 = 120$. Their graphs intersect at $(-15, 120)$ and $(8, 120)$, as shown in Figures 3.32 and 3.33. The solutions are -15 and 8 .

Numerical Solution Make a table for y_1 and y_2 . The solution of 8 is shown in Figure 3.34, and the solution of -15 may be found by scrolling through the table. The equation $y_1 = y_2$ is satisfied when $x = -15$ or 8 . The symbolic, graphical, and numerical solutions agree.

Calculator Help

To find a point of intersection, see Appendix A (page AP-8).

$[-20, 20, 5]$ by $[-20, 150, 10]$

Figure 3.32

8	120	120
9	144	120
10	170	120
11	198	120

X = 8

Figure 3.34

Now If the solutions are fractions or irrational numbers, it may be difficult or even impossible to determine them with a table of values.

Now Try Exercise 105 ◀

The Square Root Property

Some types of quadratic equations can be written as $x^2 = k$, where k is a nonnegative number. The solutions to this equation are $\pm\sqrt{k}$. (Recall that the symbol \pm represents *plus* or *minus*.) For example, $x^2 = 16$ has two solutions: ± 4 . We refer to this as the **square root property**. See Extended and Discovery Exercise 7 for a justification of this property.

Algebra Review

To review square roots, see Chapter R (page R-40).

Square Root Property

Let k be a nonnegative number. Then the solutions to the equation

$$x^2 = k$$

are given by $x = \pm\sqrt{k}$.

EXAMPLE 4 Using the square root property

If a metal ball is dropped 100 feet from a water tower, its height h in feet above the ground after t seconds is given by $h(t) = 100 - 16t^2$. Determine how long it takes the ball to hit the ground.

SOLUTION The ball strikes the ground when the equation $100 - 16t^2 = 0$ is satisfied.

$$100 - 16t^2 = 0$$

$$100 = 16t^2 \quad \text{Add } 16t^2 \text{ to each side.}$$

$$t^2 = \frac{100}{16} \quad \text{Divide each side by 16. Rewrite.}$$

$$t = \pm\sqrt{\frac{100}{16}} \quad \text{Square root property}$$

$$t = \pm\frac{10}{4} \quad \text{Simplify.}$$

In this example only positive values for time are valid, so the ball strikes the ground after $\frac{10}{4}$, or 2.5, seconds. **Now Try Exercise 101** ◀

Functions can be defined by formulas, graphs, tables, and diagrams. Functions can also be defined by equations. In the next example we use the square root property to solve equations for y and then determine if y is a function of x , where $y = f(x)$.

EXAMPLE 5 Determining if equations represent functions

Solve each equation for y . Determine if y is a function of x .

(a) $x^2 + (y - 1)^2 = 4$ (b) $2y = \frac{x + y}{2}$

SOLUTION

(a) Start by subtracting x^2 from each side of the equation.

$$(y - 1)^2 = 4 - x^2 \quad \text{Subtract } x^2 \text{ from each side.}$$

$$y - 1 = \pm\sqrt{4 - x^2} \quad \text{Square root property}$$

$$y = 1 \pm \sqrt{4 - x^2} \quad \text{Add 1 to each side.}$$

There are two formulas, $y = 1 + \sqrt{4 - x^2}$ and $y = 1 - \sqrt{4 - x^2}$, which indicates that y is *not* a function of x . That is, one x -input can produce two y -outputs.

NOTE The equation $x^2 + (y - 1)^2 = 4$ is in standard form for a circle that has center $(0, 1)$ and radius 2. A circle does not pass the vertical line test, so the equation does not represent a function. Use two functions to graph this circle by letting $y_1 = 1 + \sqrt{4 - x^2}$ (upper half) and $y_2 = 1 - \sqrt{4 - x^2}$ (lower half).

Algebra Review

To clear fractions, see Chapter R (page R-35).

(b) Clear fractions by multiplying each side of $2y = \frac{x+y}{2}$ by 2.

$$4y = x + y \quad \text{Multiply each side by 2.}$$

$$3y = x \quad \text{Subtract } y \text{ from each side.}$$

$$y = \frac{x}{3} \quad \text{Divide each side by 3.}$$

The equation $y = \frac{x}{3}$ defines a linear function, so y is a function of x .

Now Try Exercises 67 and 69

Completing the Square

Another technique that can be used to solve a quadratic equation is *completing the square*. If a quadratic equation is written in the form $x^2 + kx = d$, where k and d are constants, then the equation can be solved using

$$x^2 + kx + \left(\frac{k}{2}\right)^2 = \left(x + \frac{k}{2}\right)^2.$$

For example, $k = 6$ in $x^2 + 6x = 7$, so add $\left(\frac{6}{2}\right)^2 = (3)^2 = 9$ to each side.

$$x^2 + 6x = 7 \quad \text{Given equation}$$

$$x^2 + 6x + 9 = 7 + 9 \quad \text{Add 9 to each side.}$$

$$(x + 3)^2 = 16 \quad \text{Factor the perfect square.}$$

$$x + 3 = \pm 4 \quad \text{Square root property}$$

$$x = -3 \pm 4 \quad \text{Add } -3 \text{ to each side.}$$

$$x = 1 \quad \text{or} \quad x = -7 \quad \text{Simplify.}$$

Algebra Review

To review factoring perfect square trinomials, see Chapter R (page R-26).

NOTE If the coefficient a of the x^2 -term is not 1, we can divide each side of the equation by a so that it becomes 1. See Example 6(b).

Completing the square is useful when solving quadratic equations that do not factor easily.

EXAMPLE 6 Completing the square

Solve each equation

(a) $x^2 - 8x + 9 = 0$ (b) $2x^2 - 8x = 7$

SOLUTION

(a) Start by writing the equation in the form $x^2 + kx = d$.

$$x^2 - 8x + 9 = 0 \quad \text{Given equation}$$

$$x^2 - 8x = -9 \quad \text{Subtract 9 from each side.}$$

$$x^2 - 8x + 16 = -9 + 16 \quad \text{Add } \left(\frac{-8}{2}\right)^2 = (-4)^2 = 16.$$

$$(x - 4)^2 = 7 \quad \text{Factor the perfect square.}$$

$$x - 4 = \pm \sqrt{7} \quad \text{Square root property}$$

$$x = 4 \pm \sqrt{7} \quad \text{Add 4 to each side.}$$

(b) Divide each side by 2 to obtain a 1 for the leading coefficient.

$$\begin{array}{ll}
 2x^2 - 8x = 7 & \text{Given equation} \\
 x^2 - 4x = \frac{7}{2} & \text{Divide by 2.} \\
 x^2 - 4x + 4 = \frac{7}{2} + 4 & \text{Add } \left(\frac{-4}{2}\right)^2 = 4 \text{ to each side.} \\
 (x - 2)^2 = \frac{15}{2} & \text{Factor the perfect square.} \\
 x - 2 = \pm \sqrt{\frac{15}{2}} & \text{Square root property} \\
 x = 2 \pm \sqrt{\frac{15}{2}} & \text{Add 2 to each side.}
 \end{array}$$

Now Try Exercises 49 and 51

Symbolic, Numerical, and Graphical Solutions Quadratic equations can be solved symbolically, numerically, and graphically. The following example illustrates each technique for the equation $x(x - 2) = 3$.

Symbolic Solution

$$\begin{aligned}
 x(x - 2) &= 3 \\
 x^2 - 2x &= 3 \\
 x^2 - 2x - 3 &= 0 \\
 (x + 1)(x - 3) &= 0 \\
 \text{The solutions are } -1 &\text{ and } 3.
 \end{aligned}$$

Numerical Solution

x	$x(x - 2)$
-2	8
-1	3
0	0
1	-1
2	0
3	3
4	8

Let $y = x(x - 2)$. In the table $y = 3$ when $x = -1$ or $x = 3$.

Graphical Solution

The graph of $y = x(x - 2)$ intersects the graph of $y = 3$ at $(-1, 3)$ and $(3, 3)$. The solutions are -1 and 3 .

The Quadratic Formula

The quadratic formula can be used to find the solutions to *any* quadratic equation.

Quadratic Formula

The solutions to the quadratic equation $ax^2 + bx + c = 0$, where $a \neq 0$, are given by

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}.$$

NOTE When solving quadratic equations, a common strategy is to first write the equation in the form $ax^2 + bx + c = 0$ and to then try to factor the left side of the equation. If the factors are not easily found, the quadratic formula is used. Unlike graphical and numerical solutions, the quadratic formula always finds the exact solutions to a quadratic equation.

EXAMPLE 7 Using the quadratic formulaSolve the equation $3x^2 - 6x + 2 = 0$.**SOLUTION** Let $a = 3$, $b = -6$, and $c = 2$.

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \quad \text{Quadratic formula}$$

$$x = \frac{-(-6) \pm \sqrt{(-6)^2 - 4(3)(2)}}{2(3)} \quad \text{Substitute for } a, b, \text{ and } c$$

$$x = \frac{6 \pm \sqrt{12}}{6} \quad \text{Simplify}$$

$$x = 1 \pm \frac{1}{6}\sqrt{12} \quad \text{Divide: } \frac{a \pm b}{c} = \frac{a}{c} \pm \frac{b}{c}$$

Algebra Review

To review simplifying square roots, see Chapter R (page R-46).

NOTE Because $\sqrt{12} = \sqrt{4} \cdot \sqrt{3} = 2\sqrt{3}$, we can write $1 \pm \frac{1}{6}\sqrt{12}$ as $1 \pm \frac{1}{3}\sqrt{3}$.

Now Try Exercise 21 ◀

CLASS DISCUSSION

Use the results of Example 7 to evaluate each expression mentally.

$$3\left(1 + \frac{1}{6}\sqrt{12}\right)^2 - 6\left(1 + \frac{1}{6}\sqrt{12}\right) + 2, \quad 3\left(1 - \frac{1}{6}\sqrt{12}\right)^2 - 6\left(1 - \frac{1}{6}\sqrt{12}\right) + 2$$

EXAMPLE 8 Estimating an athlete's heart rateSolve the quadratic equation $1.875x^2 - 30x + 90 = 0$ symbolically, graphically, and numerically, where $0 \leq x \leq 8$. (This equation was discussed in the introduction to this section.)**SOLUTION****Symbolic Solution** Let $a = 1.875$, $b = -30$, and $c = 90$ in the quadratic formula.

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \quad \text{Quadratic formula}$$

$$= \frac{-(-30) \pm \sqrt{(-30)^2 - 4(1.875)(90)}}{2(1.875)} \quad a = 1.875, b = -30, \text{ and } c = 90$$

$$= \frac{30 \pm \sqrt{225}}{3.75} \quad \text{Simplify.}$$

$$= 12 \text{ or } 4 \quad \text{Simplify.}$$

The x -values are restricted to $0 \leq x \leq 8$, so the only valid solution is 4. Thus the athlete's heart rate reached 110 beats per minute 4 minutes after the athlete stopped exercising.**Graphical Solution** To use the x -intercept method to solve this quadratic equation, graph $y_1 = 1.875x^2 - 30x + 90$ and locate the x -intercepts, as shown in Figures 3.35 and 3.36. The x -intercepts are 4 and 12, in agreement with the symbolic solution.

Numerical Solution Make a table of $y_1 = 1.875x^2 - 30x + 90$, as shown in Figure 3.37. The numerical solution agrees with the symbolic and graphical solutions because $y_1 = 0$ when $x = 4$ or $x = 12$.

Calculator Help

To find a zero, or x -intercept, see Appendix A (page AP-9).

$[0, 16, 4]$ by $[-125, 125, 25]$

Figure 3.37

Now Try Exercise 103

The Discriminant

One important difference between linear equations and nonlinear equations is that nonlinear equations, in general, can have *any* number of solutions. If the quadratic equation $ax^2 + bx + c = 0$ is solved graphically, the parabola $y = ax^2 + bx + c$ can intersect the x -axis zero, one, or two times, as illustrated in Figures 3.38–3.40, respectively. Each x -intercept is a *real* solution to the quadratic equation $ax^2 + bx + c = 0$.

Figure 3.38 No Real Solutions

Figure 3.39 One Real Solution

Figure 3.40 Two Real Solutions

The quantity $b^2 - 4ac$ in the quadratic formula is called the **discriminant**. It provides information about the number of real solutions to a quadratic equation.

Quadratic Equations and the Discriminant

To determine the number of real solutions to $ax^2 + bx + c = 0$ with $a \neq 0$, evaluate the discriminant $b^2 - 4ac$.

1. If $b^2 - 4ac > 0$, there are two real solutions.
2. If $b^2 - 4ac = 0$, there is one real solution.
3. If $b^2 - 4ac < 0$, there are no real solutions.

NOTE When $b^2 - 4ac < 0$, the solutions to a quadratic equation may be expressed as two complex numbers. Complex numbers are discussed in the next section.

In Example 7 the discriminant is $b^2 - 4ac = (-6)^2 - 4(3)(2) = 12$. Because the discriminant is positive, there are two real solutions.

EXAMPLE 9 Using the discriminant

Use the discriminant to find the number of solutions to $9x^2 - 12.6x + 4.41 = 0$. Then solve the equation by using the quadratic formula. Support your result graphically.

SOLUTION

Symbolic Solution Let $a = 9$, $b = -12.6$, and $c = 4.41$. The discriminant is given by

$$b^2 - 4ac = (-12.6)^2 - 4(9)(4.41) = 0.$$

Since the discriminant is 0, there is one solution.

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \quad \text{Quadratic formula}$$

$$x = \frac{-(-12.6) \pm \sqrt{0}}{18} \quad \text{Substitute.}$$

$$x = 0.7 \quad \text{Simplify.}$$

The only solution is 0.7.

Graphical Solution A graph of $y = 9x^2 - 12.6x + 4.41$ is shown in Figure 3.41. The graph suggests that there is one x -intercept: 0.7.

Now Try Exercise 83 ◀

Figure 3.41

Factoring and the Discriminant If a , b , and c are integers and $b^2 - 4ac$ is a perfect square, then the trinomial $ax^2 + bx + c$ can be factored using only integer coefficients. For example, if $6x^2 + x - 2 = 0$, then

$$b^2 - 4ac = 1^2 - 4(6)(-2) = 49,$$

which is a perfect square ($49 = 7^2$). Thus we can factor $6x^2 + x - 2$ as $(2x - 1)(3x + 2)$ to solve $6x^2 + x - 2 = 0$. However, if $3x^2 - x - 1 = 0$, then $b^2 - 4ac = 13$, which is *not* a perfect square. This trinomial cannot be factored (by using traditional methods with integer coefficients) so either the quadratic formula or completing the square should be used to solve $3x^2 - x - 1 = 0$. See Extended and Discovery Exercises 1–4 at the end of this section.

An Application In Section 3.1 we learned that the height s of an object propelled into the air is modeled by $s(t) = -16t^2 + v_0t + h_0$, where v_0 represents the object's initial (vertical) velocity in feet per second and h_0 represents the object's initial height in feet, as illustrated in Figure 3.42. In the next example we model the position of a projectile.

Figure 3.42

EXAMPLE 10 Modeling projectile motion

Table 3.5 shows the height of a projectile shot into the air.

Table 3.5 Height of a Projectile

t seconds	0	2	4	6	8
$s(t)$ (feet)	96	400	576	624	544

- Use $s(t) = -16t^2 + v_0t + h_0$ to model the data.
- After how many seconds did the projectile strike the ground?

SOLUTION

Getting Started The value for h_0 can be determined by noting that $s(0) = 96$. The value for v_0 can be determined by using any other value in the table. We use $s(2) = 400$ to determine v_0 . ▶

- (a) Because $s(0) = 96$, $h_0 = 96$ and $s(t) = -16t^2 + v_0t + 96$. Substituting $s(2) = 400$ gives the following result.

$$\begin{aligned} -16(2)^2 + v_0(2) + 96 &= 400 & s(2) &= 400 \\ 2v_0 &= 368 & \text{Subtract 32 from each side.} \\ v_0 &= 184 & \text{Divide each side by 2.} \end{aligned}$$

Thus $s(t) = -16t^2 + 184t + 96$ models the height of the projectile.

- (b) The projectile strikes the ground when $s(t) = 0$.

$$\begin{aligned} -16t^2 + 184t + 96 &= 0 & s(t) &= 0; \text{ equation to be solved} \\ 2t^2 - 23t - 12 &= 0 & \text{Divide each term by } -8. \\ (2t + 1)(t - 12) &= 0 & \text{Factor the trinomial.} \\ t = -\frac{1}{2} & \text{ or } t = 12 & \text{Solve the equation.} \end{aligned}$$

Thus the projectile strikes the ground after 12 seconds. The solution of $-\frac{1}{2}$ has no meaning in this problem because it corresponds to a time before the projectile is shot into the air. **Now Try Exercise 115** ◀

Problem Solving

Many types of applications involve quadratic equations. To solve these problems, we use the steps for “Solving Application Problems” from Section 2.3 on page 122. In the next example the dimensions of a box are found by solving a quadratic equation.

EXAMPLE 11 Solving a construction problem

A box is being constructed by cutting 2-inch squares from the corners of a rectangular piece of cardboard that is 6 inches longer than it is wide, as illustrated in Figure 3.43. If the box is to have a volume of 224 cubic inches, find the dimensions of the piece of cardboard.

Figure 3.43

SOLUTION

STEP 1: The rectangular piece of cardboard is 6 inches longer than it is wide. Let x be its width and $x + 6$ be its length.

x : Width of the cardboard in inches

$x + 6$: Length of the cardboard in inches

Geometry Review

To review formulas related to boxes, see Chapter R (page R-3).

Figure 3.44

STEP 2: First make a drawing of the box with the appropriate labeling, as shown in Figure 3.44. The width of the *bottom* of the box is $x - 4$ inches, because two square corners with sides of 2 inches have been removed. Similarly, the length of the bottom of the box is $x + 2$ inches. Because the height times the width times the length must equal the volume, or 224 cubic inches, it follows that

$$2(x - 4)(x + 2) = 224, \quad \text{or} \quad (x - 4)(x + 2) = 112.$$

STEP 3: Write the quadratic equation in the form $ax^2 + bx + c = 0$ and factor.

$$x^2 - 2x - 8 = 112$$

Equation to be solved

$$x^2 - 2x - 120 = 0$$

Subtract 112.

$$(x - 12)(x + 10) = 0$$

Factor.

$$x = 12 \quad \text{or} \quad x = -10$$

Zero-product property

Since the dimensions cannot be negative, the width of the cardboard is 12 inches and the length is 6 inches more, or 18 inches.

STEP 4: After the 2-inch-square corners are cut out, the dimensions of the bottom of the box are $12 - 4 = 8$ inches by $18 - 4 = 14$ inches. The volume of the box is then $2 \cdot 8 \cdot 14 = 224$ cubic inches, which checks. **Now Try Exercise 107** ◀

When DVDs are manufactured, a discount is sometimes given to a customer who makes a large order. Discounts affect the revenue that a company receives. We discuss this situation in the next example.

EXAMPLE 12 Determining revenue

A company charges \$5 to burn one DVD, but it reduces this cost by \$0.05 per DVD for each additional DVD ordered, up to a maximum of 60 DVDs. For example, the price for one DVD is \$5, the price for two DVDs is $2(\$4.95) = \9.90 , the price for 3 DVDs is $3(\$4.90) = \14.70 , and so on. If the total price is \$95, how many DVDs were ordered?

SOLUTION

STEP 1: We are asked to find the number of DVDs that results in an order costing \$95. Let this number be x .

x : Number of DVDs ordered

STEP 2: Revenue equals the number of DVDs sold times the price of each DVD. If x DVDs are sold, then the price in dollars of each DVD is $5 - 0.05(x - 1)$. (Note that when $x = 1$ the price is $5 - 0.05(1 - 1) = \$5$.) The revenue R is given by

$$R(x) = x(5 - 0.05(x - 1)),$$

and we must solve the equation

$$x(5 - 0.05(x - 1)) = 95, \quad \text{or} \quad -0.05x^2 + 5.05x - 95 = 0.$$

STEP 3: Although this equation could be solved symbolically, we solve it graphically by letting $Y_1 = X(5 - 0.05(X - 1))$ and $Y_2 = 95$. In Figures 3.45 and 3.46, their graphs intersect at $(25, 95)$ and $(76, 95)$. The discount only applies to orders up to 60 DVDs, so the answer is 25 DVDs.

STEP 4: If 25 DVDs are ordered, then the cost of each DVD is $5 - 0.05(24) = \$3.80$ and the total revenue is $25(3.80) = \$95$. **Now Try Exercise 113** ◀

$[0, 100, 10]$ by $[0, 150, 50]$

Figure 3.45

$[0, 100, 10]$ by $[0, 150, 50]$

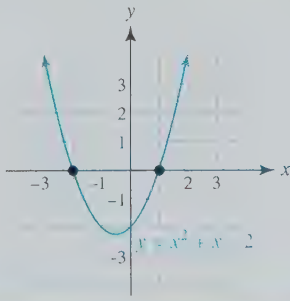

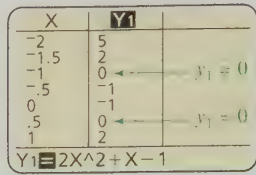

Figure 3.46

3.2 Putting It All Together

The following table summarizes important topics related to quadratic equations.

Concept	Explanation	Examples
Quadratic equation	$ax^2 + bx + c = 0$, where a , b , and c are constants with $a \neq 0$	A quadratic equation can have zero, one, or two real solutions. $x^2 = -5$ No real solutions $(x - 2)^2 = 0$ One real solution $x^2 - 4 = 0$ Two real solutions
Factoring	A symbolic technique for solving equations, based on the zero-product property: if $ab = 0$, then either $a = 0$ or $b = 0$.	$x^2 - 3x = -2$ $x^2 - 3x + 2 = 0$ $(x - 1)(x - 2) = 0$ $x - 1 = 0 \quad \text{or} \quad x - 2 = 0$ $x = 1 \quad \text{or} \quad x = 2$
Square root property	The solutions to $x^2 = k$ are $x = \pm\sqrt{k}$, where $k \geq 0$.	$x^2 = 9$ is equivalent to $x = \pm 3$. $x^2 = 11$ is equivalent to $x = \pm\sqrt{11}$.
Completing the square	To solve $x^2 + kx = d$ symbolically, add $\left(\frac{k}{2}\right)^2$ to each side to obtain a perfect square trinomial. Then apply the square root property.	$x^2 - 6x = 1$ $x^2 - 6x + 9 = 1 + 9 \quad \left(\frac{-6}{2}\right)^2 = 9$ $(x - 3)^2 = 10$ $x - 3 = \pm\sqrt{10}$ $x = 3 \pm \sqrt{10}$
Quadratic formula	The solutions to $ax^2 + bx + c = 0$ are given by $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$ Always gives the <i>exact</i> solutions	To solve $2x^2 - x - 4 = 0$, let $a = 2$, $b = -1$, and $c = -4$. $x = \frac{-(-1) \pm \sqrt{(-1)^2 - 4(2)(-4)}}{2(2)}$ $= \frac{1 \pm \sqrt{33}}{4} \approx 1.69 \text{ or } -1.19$
Graphical solution	To use the <i>x-intercept method</i> to solve $ax^2 + bx + c = 0$, let y_1 equal the left side of the equation and graph y_1 . The real solutions correspond to the x -intercepts. The <i>intersection-of-graphs</i> method can also be used when one side of the equation is <i>not</i> equal to 0. Let y_1 equal the left side of the equation and y_2 equal the right side of the equation. The real solutions correspond to the x -coordinates of any points of intersection.	To solve $x^2 + x - 2 = 0$, graph $y = x^2 + x - 2$. The x -intercepts are -2 and 1 . 

continued from previous page

Concept	Explanation	Examples
Numerical solution	<p>To solve $ax^2 + bx + c = 0$, let y_1 equal the left side of the equation and create a table for y_1. The zeros of y_1 are the real solutions.</p> <p>May <i>not</i> be a good method when solutions are fractions or irrational numbers</p>	<p>To solve $2x^2 + x - 1 = 0$, make a table for $Y_1 = 2X^2 + X - 1$. The solutions are $-1, 0.5$.</p> 

3.2 Exercises

Quadratic Equations

Exercises 1–28: Solve the quadratic equation. Check your answers for Exercises 1–12.

1. $x^2 + x - 11 = 1$
2. $x^2 - 9x + 10 = -8$
3. $t^2 = 2t$
4. $t^2 - 7t = 0$
5. $3x^2 - 7x = 0$
6. $5x = 9x^2$
7. $2z^2 = 13z + 15$
8. $4z^2 = 7 - 27z$
9. $x(3x + 14) = 5$
10. $x(5x + 19) = 4$
11. $6x^2 + \frac{5}{2} = 8x$
12. $8x^2 + 63 = -46x$
13. $(t + 3)^2 = 5$
14. $(t - 2)^2 = 11$
15. $4x^2 - 13 = 0$
16. $9x^2 - 11 = 0$
17. $2(x - 1)^2 + 4 = 0$
18. $-3(x + 5)^2 - 6 = 0$
19. $\frac{1}{2}x^2 - 3x + \frac{1}{2} = 0$
20. $\frac{3}{4}x^2 + \frac{1}{2}x - \frac{1}{2} = 0$
21. $-3z^2 - 2z + 4 = 0$
22. $-4z^2 + z + 1 = 0$
23. $25k^2 + 1 = 10k$
24. $49k^2 + 4 = -28k$
25. $-0.3x^2 + 0.1x = -0.02$
26. $-0.1x^2 + 1 = 0.5x$
27. $2x(x + 2) = (x - 1)(x + 2)$
28. $(2x - 1)(x + 2) = (x + 3)(x + 1)$

Exercises 29–34: Find the exact values of any x -intercepts.

29.

30.

31.

32.

33.

34.

Graphical and Numerical Solutions

Exercises 35–42: Solve each quadratic equation (a) graphically, (b) numerically, and (c) symbolically. Express graphical and numerical solutions to the nearest tenth when appropriate.

35. $x^2 + 2x = 0$

36. $x^2 - 4 = 0$

37. $x^2 - x - 6 = 0$

38. $2x^2 + 5x - 3 = 0$

39. $2x^2 = 6$

40. $x^2 - 225 = 0$

41. $4x(x - 3) = -9$

42. $-4x(x - 1) = 1$

Exercises 43–46: Solve the quadratic equation graphically.

43. $20x^2 + 11x = 3$

44. $-2x^2 + 4x = 1.595$

45. $2.5x^2 = 4.75x - 2.1$

46. $x(x + 24) = 6912$

Completing the Square

Exercises 47–60: Solve the equation by completing the square.

47. $x^2 + 4x - 6 = 0$

48. $x^2 - 10x = 1$

49. $x^2 + 5x = 4$

50. $x^2 + 6x - 5 = 0$

51. $3x^2 - 6x = 2$

52. $2x^2 - 3x + 1 = 0$

53. $x^2 - 8x = 10$

54. $x^2 - 2x = 2$

55. $\frac{1}{2}t^2 - \frac{3}{2}t = 1$

56. $\frac{1}{3}t^2 + \frac{1}{2}t = 2$

57. $-2z^2 + 3z + 1 = 0$

58. $-3z^2 - 5z + 3 = 0$

59. $-\frac{3}{2}z^2 - \frac{1}{4}z + 1 = 0$

60. $-\frac{1}{5}z^2 - \frac{1}{2}z + 2 = 0$

Finding Domains

Exercises 61–64: Find the domain of the function. Write your answer in set-builder notation.

61. $f(x) = \frac{1}{x^2 - 5}$

62. $f(x) = \frac{4x}{7 - x^2}$

63. $g(t) = \frac{5 - t}{t^2 - t - 2}$

64. $g(t) = \frac{t + 1}{2t^2 - 11t - 21}$

Solving for a Variable

Exercises 65–72: (Refer to Example 5.) Solve the equation for y . Determine if y is a function of x .

65. $4x^2 + 3y = \frac{y + 1}{3}$

66. $\frac{x^2 + y}{2} = y - 2$

67. $3y = \frac{2x - y}{3}$

68. $\frac{5 - y}{3} = \frac{x + 3y}{4}$

69. $x^2 + (y - 3)^2 = 9$

70. $(x + 2)^2 + (y + 1)^2 = 1$

71. $3x^2 + 4y^2 = 12$

72. $x - 25y^2 = 50$

Exercises 73–80: Solve for the specified variable.

73. $V = \frac{1}{3}\pi r^2 h$ for r

74. $V = \frac{1}{2}gt^2 + h$ for t

75. $K = \frac{1}{2}mv^2$ for v

76. $W = I^2 R$ for I

77. $a^2 + b^2 = c^2$ for b

78. $S = 4\pi r^2 + x^2$ for r

79. $s = -16t^2 + 100t$ for t

80. $T^2 - kT - k^2 = 0$ for T

The Discriminant

Exercises 81–96: Complete the following.

(a) Write the equation as $ax^2 + bx + c = 0$ with $a > 0$.

(b) Calculate the discriminant $b^2 - 4ac$ and determine the number of real solutions.

(c) Solve the equation.

81. $3x^2 = 12$

82. $8x^2 - 2 = 14$

83. $x^2 - 2x = -1$

84. $6x^2 = 4x$

85. $4x = x^2$

86. $16x^2 + 9 = 24x$

87. $x^2 + 1 = x$

88. $2x^2 + x = 2$

89. $2x^2 + 3x = 12 - 2x$

90. $3x^2 + 3 = 5x$

91. $9x(x - 4) = -36$

92. $\frac{1}{4}x^2 + 3x = x - 4$

93. $x(\frac{1}{2}x + 1) = -\frac{13}{2}$

94. $4x = 6 + x^2$

95. $3x^2 = 1 - x$

96. $x(5x - 3) = 1$

Exercises 97–100: The graph of $f(x) = ax^2 + bx + c$ is shown in the figure.

(a) State whether $a > 0$ or $a < 0$.

(b) Solve the equation $ax^2 + bx + c = 0$.

(c) Is the discriminant positive, negative, or zero?

97.

98.

Applications and Models

101. **Height of Baseball** A baseball is dropped from a stadium seat that is 75 feet above the ground. Its height s in feet after t seconds is given by $s(t) = 75 - 16t^2$. Estimate to the nearest tenth of a second how long it takes for the baseball to strike the ground.

102. **Height of Baseball** A baseball is thrown downward with an initial velocity of 30 feet per second from a stadium seat that is 80 feet above the ground. Estimate to the nearest tenth of a second how long it takes for the baseball to strike the ground.

103. **U.S. AIDS Deaths** From 1984 to 1994 the equation

$$D(x) = 2375x^2 + 5134x + 5020$$

modeled the cumulative number of AIDS deaths x years after 1984. Estimate the year when there were 90,000 deaths.

104. **U.S. AIDS Cases** From 1984 to 1994 the cumulative number of AIDS cases can be modeled by the equation

$$C(x) = 3034x^2 + 14,018x + 6400,$$

where x represents years after 1984. Estimate the year when 200,000 AIDS cases had been diagnosed.

105. **Screen Dimensions** The width of a rectangular computer screen is 2.5 inches more than its height. If the area of the screen is 93.5 square inches, determine its dimensions symbolically, graphically, and numerically. Do your answers agree?

106. **Maximizing Area** A rectangular pen for a pet is under construction using 100 feet of fence.

(a) Find the dimensions that give an area of 576 square feet.

(b) Find the dimensions that give maximum area.

107. **Construction** (Refer to Example 11.) A box is being constructed by cutting 4-inch squares from the corners of a rectangular sheet of metal that is 10 inches longer

than it is wide. If the box is to have a volume of 476 cubic inches, find the dimensions of the metal sheet.

108. **Construction** A box is being constructed by cutting 2-inch squares from the corners of a square sheet of metal. If the box is to have a volume of 1058 cubic inches, find the dimensions of the metal sheet.

109. **Geometry** A cylindrical aluminum can is being constructed to have a height h of 4 inches. If the can is to have a volume of 28 cubic inches, approximate its radius r . (Hint: $V = \pi r^2 h$.)

110. **Braking Distance** Braking distance for cars on level pavement can be approximated by $D(x) = \frac{x^2}{30k}$. The input x is the car's velocity in miles per hour and the output $D(x)$ is the braking distance in feet. The positive constant k is a measure of the traction of the tires. Small values of k indicate a slippery road or worn tires. (Source: L. Haefner, *Introduction to Transportation Systems*.)

(a) Let $k = 0.3$. Evaluate $D(60)$ and interpret the result.

(b) If $k = 0.25$, find the velocity x that corresponds to a braking distance of 300 feet.

111. **Window Dimensions** A window comprises a square with sides of length x and a semicircle with diameter x , as shown in the figure. If the total area of the window is 463 square inches, estimate the value of x to the nearest hundredth of an inch.

112. **Picture Frame** A frame for a picture is 2 inches wide. The picture inside the frame is 4 inches longer than it is wide. See the figure. If the area of the picture is 320 square inches, find the outside dimensions of the picture frame.

113. Cost (Refer to Example 12.) A company charges \$20 to make one monogrammed shirt, but reduces this cost by \$0.10 per shirt for each *additional* shirt ordered up to 100 shirts. If the cost of an order is \$989, how many shirts were ordered?

114. Ticket Prices One airline ticket costs \$250. For each additional airline ticket sold to a group, the price of every ticket is reduced by \$2. For example, 2 tickets cost $2 \cdot 248 = \$496$ and 3 tickets cost $3 \cdot 246 = \$738$.

(a) Write a quadratic function that gives the total cost of buying x tickets.

(b) What is the cost of 5 tickets?

(c) How many tickets were sold if the cost is \$5200?

(d) What number of tickets sold gives the greatest cost?

Modeling Quadratic Data

115. Projectile Motion The table shows the height of a projectile that is shot into the air.

t (seconds)	0	1	2	3	4
s (feet)	32	176	288	368	416

(a) Use $s(t) = -16t^2 + v_0t + h_0$ to model the data.

(b) After how long did the projectile strike the ground?

116. Falling Object The table lists the velocity and distance traveled by a falling object for various elapsed times.

Time (sec)	0	1	2	3	4	5
Velocity (ft/sec)	0	32	64	96	128	160
Distance (ft)	0	16	64	144	256	400

 (a) Make a scatterplot of the ordered pairs determined by (time, velocity) and (time, distance) in the same viewing rectangle $[-1, 6, 1]$ by $[-10, 450, 50]$.

(b) Find a function v that models the velocity.

(c) The distance is modeled by $d(x) = ax^2$. Find a .

(d) Find the time when the distance is 200 feet. Find the velocity at this time.

117. Safe Runway Speed The road (or taxiway) used by aircraft to exit a runway should not have sharp curves. The safe radius for any curve depends on the speed of the airplane. The table at the top of the next column lists the minimum radius R of the exit curves, where the taxiing speed of the airplane is x miles per hour.

x (mi/hr)	10	20	30	40	50	60
R (ft)	50	200	450	800	1250	1800

Source: Federal Aviation Administration.

(a) If the taxiing speed x of the plane doubles, what happens to the minimum radius R of the curve?

(b) The FAA used $R(x) = ax^2$ to compute the values in the table. Determine a .

(c) If $R = 500$, find x . Interpret your results.

 **118. Biology** Some types of worms have a remarkable capacity to live without moisture. The table shows the number of worms y surviving after x days in one study.

x (days)	0	20	40	80	120	160
y (worms)	50	48	45	36	20	3

Source: D. Brown and P. Rothery, *Models in Biology*.

(a) Use regression to find a quadratic function f that models these data.

(b) Graph f and the data in the same window.

(c) Solve the quadratic equation $f(x) = 0$ graphically. Do both solutions have meaning? Explain.

 **119. Wal-Mart Employees** The table lists numbers of Wal-Mart employees E in millions, x years after 1987.

x	0	5	10	15	20
E	0.20	0.38	0.68	1.4	2.2

Source: Wal-Mart.

(a) Evaluate $E(15)$ and interpret the result.

(b) Find a quadratic function f that models these data.

(c) Graph the data and function f in the same xy -plane.

(d) Use f to estimate the year when the number of employees may reach 3 million.

 **120. Women in the Work Force** The number N of women in millions who were gainfully employed in the work force in selected years is shown in the table.

Year	1900	1910	1920	1930	1940	1950
N	5.3	7.4	8.6	10.8	12.8	18.4
Year	1960	1970	1980	1990	2000	2010
N	23.2	31.5	45.5	56.6	65.6	74.8

Source: Department of Labor.

- (a) Use regression to find a quadratic function f that models the data. Support your result graphically.
- (b) Predict the number of women in the labor force in 2020.

Writing about Mathematics

121. Discuss three symbolic methods for solving a quadratic equation. Make up a quadratic equation and use each method to find the solution set.
122. Explain how to solve a quadratic equation graphically.

EXTENDED AND DISCOVERY EXERCISES

Exercises 1–4: **Discriminant and Factoring** (Refer to page 196.) For each equation, calculate the discriminant. Use the discriminant to decide whether the equation can be solved by factoring. If it can, solve the equation by factoring. Otherwise, use the quadratic formula.

- $8x^2 + 14x - 15 = 0$
- $15x^2 - 17x - 4 = 0$
- $5x^2 - 3x - 3 = 0$
- $3x^2 - 2x - 4 = 0$
- Quadratic Formula** Prove the quadratic formula by completing the following.
 - Write $ax^2 + bx + c = 0$ as $x^2 + \frac{b}{a}x = -\frac{c}{a}$.
 - Complete the square to obtain $\left(x + \frac{b}{2a}\right)^2 = \frac{b^2 - 4ac}{4a^2}$.
 - Use the square root property and solve for x .
- Difference Quotient** If the difference quotient for the function $f(x) = ax^2 - bx + 1$ equals $2x + h - 4$, find values for a and b .
- Square Root Property** Use the fact that $\sqrt{x^2} = |x|$ to show that the solutions to $x^2 = k$ with $k > 0$ are given by $x = \pm\sqrt{k}$.

CHECKING BASIC CONCEPTS FOR SECTIONS 3.1 AND 3.2

- Graph $f(x) = (x - 1)^2 - 4$. Identify the vertex, axis of symmetry, and x -intercepts.
- A graph of $f(x) = ax^2 + bx + c$ is shown.
 - Is a positive, negative, or zero?
 - Find the vertex and axis of symmetry.
 - Solve $ax^2 + bx + c = 0$.
 - Is the discriminant positive, negative, or zero?

3. Use $f(x) = a(x - h)^2 + k$ to model the data exactly.

x	-3	-2	-1	0	1
$f(x)$	11	5	3	5	11

- Find the vertex on the graph of $y = 3x^2 - 9x - 2$.
- Write $f(x) = x^2 + 4x - 3$ as $f(x) = a(x - h)^2 + k$. What are the coordinates of the vertex? What is the minimum y -value of the graph of f ?
- Solve the quadratic equations.
 - $16x^2 = 81$
 - $2x^2 + 3x = 2$
 - $x^2 = x - 3$
 - $2x^2 = 3x + 4$
- Dimensions of a Rectangle** A rectangle is 4 inches longer than it is wide and has an area of 165 square inches. Find its dimensions.
- Height of a Baseball** The height s of a baseball in feet after t seconds is given by $s(t) = -16t^2 + 96t + 2$.
 - Find the height of the baseball after 1 second.
 - After how long is the baseball 142 feet high?
 - Find the maximum height of the baseball.
 - How long is the baseball in the air?

3.3 Complex Numbers

- Perform arithmetic operations on complex numbers
- Solve quadratic equations having complex solutions

Figure 3.47

Introduction

Throughout history, people have invented new numbers to solve equations and describe data. Often these new numbers were met with resistance and were regarded as being imaginary or unreal. The number 0 was not invented at the same time as the natural numbers. There was no Roman numeral for 0. No doubt there were skeptics who wondered why a number was needed to represent nothing. Negative numbers also met strong resistance. After all, how could one possibly have -6 apples? The same was true for complex numbers. However, complex numbers are no more imaginary than any other number created by mathematicians.

Basic Concepts

The graph of $y = x^2 + 1$ has no x -intercepts, as shown in Figure 3.47. Therefore the equation $x^2 + 1 = 0$ has no real solutions. If we try to solve $x^2 + 1 = 0$, we get $x^2 = -1$. Since $x^2 \geq 0$ for any real number x , there are no real number solutions. However, we can *invent* a solution.

$$x^2 = -1, \text{ or } x = \pm\sqrt{-1}$$

We now define a new number called the **imaginary unit**, denoted i .

Properties of the Imaginary Unit i

$$i = \sqrt{-1}, \quad i^2 = -1$$

Defining the number i allows us to say that the solutions to the equation $x^2 + 1 = 0$ are i and $-i$. Using the real numbers and the imaginary unit i , complex numbers can be defined. A **complex number** can be written in **standard form** as $a + bi$, where a and b are real numbers. The **real part** is a and the **imaginary part** is b . Every real number a is also a complex number because it can be written as $a + 0i$. A complex number $a + bi$ with $b \neq 0$ is an **imaginary number**. A complex number $a + bi$ with $a = 0$ and $b \neq 0$ is sometimes called a **pure imaginary number**. Examples of pure imaginary numbers include $3i$ and $-i$. Table 3.6 lists several complex numbers with their real and imaginary parts.

Table 3.6 Real and Imaginary Parts

$a + bi$	$-3 + 2i$	5	$-3i$	$-1 + 7i$	$-5 - 2i$	$4 + 6i$
a	-3	5	0	-1	-5	4
b	2	0	-3	7	-2	6

Using the imaginary unit i , square roots of negative numbers can be written as complex numbers.

The Expression $\sqrt{-a}$

$$\text{If } a > 0, \text{ then } \sqrt{-a} = i\sqrt{a}.$$

EXAMPLE 1 Simplifying the expression $\sqrt{-a}$

Simplify each expression.

$$(a) \sqrt{-16} \quad (b) \sqrt{-3} \quad (c) \frac{2 \pm \sqrt{-24}}{2}$$

SOLUTION(a) When $a > 0$, $\sqrt{-a} = i\sqrt{a}$. Thus $\sqrt{-16} = i\sqrt{16} = 4i$.(b) $\sqrt{-3} = i\sqrt{3}$; we usually do not write $\sqrt{3}i$ because of the possibility of confusion about whether i is under the square root symbol.(c) First note that $\sqrt{-24} = i\sqrt{24} = i\sqrt{4 \cdot 6} = 2i\sqrt{6}$.

$$\begin{aligned} \frac{2 \pm \sqrt{-24}}{2} &= \frac{2 \pm 2i\sqrt{6}}{2} && \text{Simplify } \sqrt{-24}. \\ &= \frac{2}{2} \pm \frac{2i\sqrt{6}}{2} && \frac{a \pm b}{c} = \frac{a}{c} \pm \frac{b}{c} \\ &= 1 \pm i\sqrt{6} && \text{Simplify fractions.} \end{aligned}$$

Now Try Exercises 1, 5, and 13

The property $\sqrt{a} \cdot \sqrt{b} = \sqrt{ab}$ is true only when *both* a and b are positive. When simplifying products containing square roots of negative numbers, it is important to first apply the property $\sqrt{-a} = i\sqrt{a}$, where $a > 0$. This technique is illustrated in the next example.

EXAMPLE 2 Simplifying complex expressions

Simplify each expression.

$$(a) \sqrt{-3} \cdot \sqrt{-3} \quad (b) \sqrt{-2} \cdot \sqrt{-8}$$

SOLUTION

$$(a) \sqrt{-3} \cdot \sqrt{-3} = i\sqrt{3} \cdot i\sqrt{3} = i^2(\sqrt{3})^2 = -1(3) = -3$$

$$\text{NOTE } \sqrt{-3} \cdot \sqrt{-3} \neq \sqrt{(-3) \cdot (-3)} = \sqrt{9} = 3$$

$$(b) \sqrt{-2} \cdot \sqrt{-8} = i\sqrt{2} \cdot i\sqrt{8} = i^2\sqrt{16} = -1(4) = -4$$

Now Try Exercises 15 and 17

Arithmetic Operations on Complex Numbers

Arithmetic operations are also defined for complex numbers.

Addition and Subtraction To add the complex numbers $(-2 + 3i)$ and $(4 - 6i)$, simply combine the real parts and the imaginary parts.

$$\begin{aligned} (-2 + 3i) + (4 - 6i) &= -2 + 4 + 3i - 6i \\ &= 2 - 3i \end{aligned}$$

This same process works for subtraction.

$$\begin{aligned} (5 - 7i) - (8 + 3i) &= 5 - 8 - 7i - 3i \\ &= -3 - 10i \end{aligned}$$

Algebra Review

Before multiplying complex numbers, you may want to review multiplication of binomials in Chapter R (page R-16).

Multiplication Two complex numbers can be multiplied. The property $i^2 = -1$ is applied when appropriate.

$$\begin{aligned} (-5 + i)(7 - 9i) &= -5(7) + (-5)(-9i) + (i)(7) + (i)(-9i) \\ &= -35 + 45i + 7i - 9i^2 \\ &= -35 + 52i - 9(-1) \\ &= -26 + 52i \end{aligned}$$

NOTE Express your results in the standard form $a + bi$.

Division The conjugate of $a + bi$ is $a - bi$. To find the conjugate, change the sign of the imaginary part b . Table 3.7 lists examples of complex numbers and their conjugates.

Table 3.7 Complex Conjugates

$a + bi$	$2 + 5i$	$6 - 3i$	$-2 + 7i$	$-1 - i$	5	$-4i$
$a - bi$	$2 - 5i$	$6 + 3i$	$-2 - 7i$	$-1 + i$	5	$4i$

Calculator Help

To perform arithmetic on complex numbers, see Appendix A (page AP-11).

To simplify the quotient $\frac{3 + 2i}{5 - i}$, first multiply both the numerator and the denominator by the conjugate of the denominator.

$$\begin{aligned} \frac{3 + 2i}{5 - i} &= \frac{(3 + 2i)(5 + i)}{(5 - i)(5 + i)} && \text{Multiply by } \frac{\text{conjugate}}{\text{conjugate}} \\ &= \frac{3(5) + (3)(i) + (2i)(5) + (2i)(i)}{(5)(5) + (5)(i) + (-i)(5) + (-i)(i)} && \text{Expand.} \\ &= \frac{15 + 3i + 10i + 2i^2}{25 + 5i - 5i - i^2} && \text{Simplify.} \\ &= \frac{15 + 13i + 2(-1)}{25 - (-1)} && i^2 = -1 \\ &= \frac{13 + 13i}{26} && \text{Simplify.} \\ &= \frac{1}{2} + \frac{1}{2}i && \frac{a + bi}{c} = \frac{a}{c} + \frac{b}{c}i \end{aligned}$$

The last step expresses the quotient as a complex number in standard form.

Evaluating Complex Arithmetic with Technology Some calculators do complex arithmetic. The evaluation of the previous examples is shown in Figures 3.48 and 3.49.

Figure 3.48

Figure 3.49

EXAMPLE 3 Performing complex arithmetic

Write each expression in standard form. Support your results using a calculator.

(a) $(-3 + 4i) + (5 - i)$ (b) $(-7i) - (6 - 5i)$

(c) $(-3 + 2i)^2$ (d) $\frac{17}{4 + i}$

$$\begin{array}{rcl}
 (-3+4i)+(5-i) & & \\
 2+3i & & \\
 (-7i)-(6-5i) & & \\
 -6-2i & &
 \end{array}$$

Figure 3.50

$$\begin{array}{rcl}
 (-3+2i)^2 & & \\
 5-12i & & \\
 17/(4+i) & & \\
 4-i & &
 \end{array}$$

Figure 3.51

SOLUTION

$$(a) \quad (-3 + 4i) + (5 - i) = -3 + 5 + 4i - i = 2 + 3i$$

$$(b) \quad (-7i) - (6 - 5i) = -6 - 7i + 5i = -6 - 2i$$

$$\begin{aligned}
 (c) \quad (-3 + 2i)^2 &= (-3 + 2i)(-3 + 2i) \\
 &= 9 - 6i - 6i + 4i^2 \\
 &= 9 - 12i + 4(-1) \\
 &= 5 - 12i
 \end{aligned}$$

$$\begin{aligned}
 (d) \quad \frac{17}{4+i} &= \frac{17}{4+i} \cdot \frac{4-i}{4-i} && \text{Multiply by } \frac{\text{conjugate}}{\text{conjugate}} \\
 &= \frac{68 - 17i}{16 - i^2} \\
 &= \frac{68 - 17i}{17} && i^2 = -1 \\
 &= 4 - i
 \end{aligned}$$

Standard forms can be found using a calculator. See Figures 3.50 and 3.51.

Now Try Exercises 23, 25, 35, and 39

MAKING CONNECTIONS

Complex, Real, and Imaginary Numbers The following diagram illustrates the relationship among complex, real, and imaginary numbers, where a and b are real numbers. Note that complex numbers comprise two disjoint sets of numbers: the real numbers and the imaginary numbers.

NOTE Every real number is a complex number.

Quadratic Equations with Complex Solutions

We can use the quadratic formula to solve the quadratic equation $ax^2 + bx + c = 0$. If the discriminant, $b^2 - 4ac$, is negative, then there are no real solutions, and the graph of $y = ax^2 + bx + c$ does not intersect the x -axis. However, there are solutions that can be expressed as imaginary numbers. This is illustrated in the next example.

EXAMPLE 1 Solving quadratic equations with imaginary solutions

Solve the quadratic equation. Support your results graphically.

$$(a) \quad \frac{1}{2}x^2 + 17 = 5x \quad (b) \quad x^2 + 3x + 5 = 0 \quad (c) \quad -2x^2 = 3$$

SOLUTION

Getting Started Write each equation as $ax^2 + bx + c = 0$, and then apply the quadratic formula, which always “works.” ▶

Figure 3.52

Figure 3.53

Figure 3.54

- (a) Rewrite the equation as $\frac{1}{2}x^2 - 5x + 17 = 0$, and let $a = \frac{1}{2}$, $b = -5$, and $c = 17$.

$$\begin{aligned} x &= \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \\ &= \frac{5 \pm \sqrt{(-5)^2 - 4(0.5)(17)}}{2(0.5)} \\ &= 5 \pm \sqrt{-9} \\ &= 5 \pm 3i \end{aligned}$$

In Figure 3.52 the graphs of $y_1 = \frac{1}{2}x^2 + 17$ and $y_2 = 5x$ do not intersect, which indicates that the equation $\frac{1}{2}x^2 + 17 = 5x$ has no real solutions. However, there are two complex solutions that are imaginary.

- (b) Let $a = 1$, $b = 3$, and $c = 5$ and apply the quadratic formula.

$$\begin{aligned} x &= \frac{-3 \pm \sqrt{3^2 - 4(1)(5)}}{2(1)} \\ &= \frac{-3 \pm \sqrt{-11}}{2} \\ &= \frac{-3 \pm i\sqrt{11}}{2} \\ &= -\frac{3}{2} \pm \frac{i\sqrt{11}}{2} \end{aligned}$$

In Figure 3.53 the graph of $y_1 = x^2 + 3x + 5$ does not intersect the x -axis, which indicates that the equation $x^2 + 3x + 5 = 0$ has no real solutions. However, there are two complex solutions that are imaginary.

- (c) Rather than use the quadratic formula for this equation, we apply the square root property because the equation contains no x -term.

$$\begin{aligned} -2x^2 &= 3 && \text{Given equation} \\ x^2 &= -\frac{3}{2} && \text{Divide by } -2 \\ x &= \pm\sqrt{-\frac{3}{2}} && \text{Square root property} \\ x &= \pm i\sqrt{\frac{3}{2}} && \sqrt{-a} = i\sqrt{a} \end{aligned}$$

In Figure 3.54 the graphs of $y_1 = -2x^2$ and $y_2 = 3$ do not intersect, which indicates that the equation $-2x^2 = 3$ has no real solutions. However, there are two complex solutions that are imaginary.

Now Try Exercises 59, 65, and 67

CLASS DISCUSSION

What is the result if the expression is evaluated? (See Example 4(b).)

$$\left(-\frac{3}{2} + \frac{i\sqrt{11}}{2}\right)^2 + 3\left(-\frac{3}{2} + \frac{i\sqrt{11}}{2}\right) + 5$$

3.3 Putting It All Together

Some of the important topics in this section are summarized in the following table.

Concept	Explanation	Comments and Examples										
Imaginary unit	$i = \sqrt{-1}, i^2 = -1$	The imaginary unit i allows us to define the complex numbers.										
The expression $\sqrt{-a}$ with $a > 0$	$\sqrt{-a} = i\sqrt{a}$	$\sqrt{-4} = 2i$ $\sqrt{-5} = i\sqrt{5}$ $\sqrt{-32} = i\sqrt{32} = i\sqrt{16}\sqrt{2} = 4i\sqrt{2}$ $\sqrt{-5}\sqrt{-20} = i\sqrt{5}i\sqrt{20} = i^2\sqrt{100} = -10$										
Complex number	$a + bi$, where a and b are real numbers	Every real number is a complex number. $5 - 4i$, 5 , $2 + i$, and $-9i$ are examples of complex numbers.										
Standard form of a complex number	$a + bi$, where a and b are real numbers	Converting to standard form: $\frac{3 \pm 4i}{2} = \frac{3}{2} + 2i \quad \text{or} \quad \frac{3}{2} - 2i$										
Conjugates	The conjugate of $a + bi$ is $a - bi$.	<table><tr><th>Number</th><th>Conjugate</th></tr><tr><td>$5 - 6i$</td><td>$5 + 6i$</td></tr><tr><td>$-12i$</td><td>$12i$</td></tr><tr><td>-7</td><td>-7</td></tr><tr><td>$2 + 3i$</td><td>$2 - 3i$</td></tr></table>	Number	Conjugate	$5 - 6i$	$5 + 6i$	$-12i$	$12i$	-7	-7	$2 + 3i$	$2 - 3i$
Number	Conjugate											
$5 - 6i$	$5 + 6i$											
$-12i$	$12i$											
-7	-7											
$2 + 3i$	$2 - 3i$											
Arithmetic operations on complex numbers	Complex numbers may be added, subtracted, multiplied, or divided.	$(2 + 3i) + (-3 - i) = -1 + 2i$ $(5 + i) - (3 - i) = 2 + 2i$ $(1 + i)(5 - i) = 5 - i + 5i - i^2 = 6 + 4i$ $\frac{3 + i}{1 - i} = \frac{(3 + i)(1 + i)}{(1 - i)(1 + i)}$ $= 1 + 2i$										
Complex solutions to equations	Complex numbers $a + bi$ with $b \neq 0$ can be solutions to equations that cannot be solved with only real numbers.	$x^2 + 5 = 0$ implies $x^2 = -5$; there are no real solutions, but $x = \pm i\sqrt{5}$ are two complex solutions. Note that the graph of $y = x^2 + 5$ has no x -intercepts. The quadratic formula can be used to find complex solutions.

52. $(\frac{3}{4} - \frac{1}{10}i) - (-\frac{1}{8} + \frac{4}{25}i)$
53. $(-12.6 - 5.7i)(5.1 - 9.3i)$
54. $(7.8 + 23i)(-1.04 + 2.09i)$

Exercises 55 and 56: Evaluate with a calculator. Round values to the nearest thousandth.

55. $\frac{17 - 135i}{18 + 142i}$
56. $\frac{141 + 52i}{102 - 31i}$

Quadratic Equations with Complex Solutions

Exercises 57–74: Solve. Write answers in standard form.

57. $x^2 + 5 = 0$
58. $4x^2 + 3 = 0$
59. $5x^2 + 1 = 3x^2$
60. $x(3x + 1) = -1$
61. $3x = 5x^2 + 1$
62. $4x^2 = x - 1$
63. $x(x - 4) = -5$
64. $2x^2 + x + 1 = 0$
65. $x^2 = 3x - 5$
66. $3x - x^2 = 5$
67. $x^2 + 2x + 4 = 0$
68. $x(x - 4) = -8$
69. $3x^2 - 4x = x^2 - 3$
70. $2x^2 + 3 = 1 - x$
71. $2x(x - 2) = x - 4$
72. $3x^2 + x = x(5 - x) - 2$
73. $3x(3 - x) - 8 = x(x - 2)$
74. $-x(7 - 2x) = -6 - (3 - x)$

Zeros of Quadratic Functions

Exercises 75–80: The graph of a function is given.

- (a) Use the graph to predict the number of real zeros and the number of imaginary zeros.
 (b) Find these zeros using the quadratic formula.

Writing about Mathematics

81. Could a quadratic function have one real zero and one imaginary zero? Explain.
 82. Give an example of a quadratic function that has only real zeros and an example of one that has only imaginary zeros. How do their graphs compare? Explain how to determine from a graph whether a quadratic function has real zeros.

EXTENDED AND DISCOVERY EXERCISE

1. **Powers of i** The properties of the imaginary unit are $i = \sqrt{-1}$ and $i^2 = -1$.
 (a) Begin simplifying the expressions $i, i^2, i^3, i^4, i^5, \dots$, until a simple pattern is discovered. For example, $i^3 = i \cdot i^2 = i \cdot (-1) = -i$.
 (b) Summarize your findings by describing how to simplify i^n for any natural number n .

3.4 Quadratic Inequalities

- Understand basic concepts about quadratic inequalities
- Solve quadratic inequalities graphically
- Solve quadratic inequalities symbolically

Introduction

Highway engineers often use quadratic functions to model safe stopping distances for cars. For example, $f(x) = \frac{1}{12}x^2 + \frac{11}{5}x$ is sometimes used to model the stopping distance for a car traveling at x miles per hour on dry, level pavement. If a driver can see only 200 feet ahead on a highway with a sharp curve, then safe driving speeds x satisfy the *quadratic inequality*

$$\frac{1}{12}x^2 + \frac{11}{5}x \leq 200,$$

or equivalently,

$$\frac{1}{12}x^2 + \frac{11}{5}x - 200 \leq 0.$$

(See Example 3.) This section discusses methods for solving quadratic inequalities.

Basic Concepts

A quadratic equation can be written as $ax^2 + bx + c = 0$ with $a \neq 0$. If the equals sign is replaced by $>$, \geq , $<$, or \leq , a **quadratic inequality** results. Examples of quadratic inequalities include

$$x^2 + 2x - 1 \geq 0, \quad 4x^2 < 1, \quad \text{and} \quad 2x^2 \leq 1 - 3x.$$

MAKING CONNECTIONS

Quadratic Function, Equation, and Inequality The three concepts are closely related.

$$f(x) = ax^2 + bx + c, a \neq 0 \quad \text{Quadratic function}$$

$$ax^2 + bx + c = 0, a \neq 0 \quad \text{Quadratic equation}$$

$$ax^2 + bx + c \geq 0, a \neq 0 \quad \text{Quadratic inequality}$$

Because equality is (usually) the boundary between *greater than* and *less than*, a first step in solving a quadratic inequality is to determine the x -values where equality occurs. These x -values are the *boundary numbers*. We begin by discussing graphical solutions to quadratic inequalities.

Graphical and Numerical Solutions

The graph of a quadratic function is a parabola that opens either upward or downward. For example, Figure 3.55 shows the parabola $y = x^2 - x - 6$. Since $a = 1$, this parabola opens upward. It has x -intercepts -2 and 3 , which satisfy the equation $x^2 - x - 6 = 0$. The parabola lies below the x -axis between the intercepts (or boundary numbers), so the solution set to the inequality $x^2 - x - 6 < 0$ is $\{x \mid -2 < x < 3\}$, or $(-2, 3)$ in interval notation. Similarly, the solutions to $x^2 - x - 6 > 0$ include x -values either left of $x = -2$ or right of $x = 3$, where the parabola is above the x -axis. This solution set is $\{x \mid x < -2 \text{ or } x > 3\}$, or $(-\infty, -2) \cup (3, \infty)$ in interval notation.

Figure 3.55

MAKING CONNECTIONS

Graphs and Inequalities Suppose that $y = ax^2 + bx + c$. Then the solution set to $y > 0$ includes all x -values where the graph of y is *above* the x -axis. Similarly, the solution set to $y < 0$ includes all x -values where the graph of y is *below* the x -axis. This is because the x -axis corresponds to $y = 0$. This discussion is illustrated in Figures 3.56 and 3.57.

Figure 3.56

Figure 3.57

EXAMPLE 1 Solving quadratic inequalities graphically

Use the graphs of $y = ax^2 + bx + c$ in Figures 3.58–3.61 to solve the inequalities:

- i. $ax^2 + bx + c \leq 0$ ii. $ax^2 + bx + c > 0$

Figure 3.58

Figure 3.59

Figure 3.60

Figure 3.61

SOLUTION

- (a) i. $ax^2 + bx + c \leq 0$ The x -intercepts, or boundary numbers, are -1 and 2 . Between these x -values, the graph is below the x -axis and the y -values are negative. The solution set is $\{x \mid -1 \leq x \leq 2\}$.
 ii. $ax^2 + bx + c > 0$ The graph is above the x -axis, and the y -values are positive, either left of $x = -1$ or right of $x = 2$. The solution set is $\{x \mid x < -1 \text{ or } x > 2\}$.
- (b) i. $ax^2 + bx + c \leq 0$ The parabola opens downward with x -intercepts, or boundary numbers, of -4 and 2 . The graph is below the x -axis, and the y -values are negative, either left of $x = -4$ or right of $x = 2$. The solution set is $\{x \mid x \leq -4 \text{ or } x \geq 2\}$.
 ii. $ax^2 + bx + c > 0$ Between $x = -4$ and $x = 2$, the graph is above the x -axis and the y -values are positive. The solution set is $\{x \mid -4 < x < 2\}$.
- (c) i. $ax^2 + bx + c \leq 0$ The graph never dips below the x -axis so the y -values are never negative. There is one x -intercept at $x = 3$, where $y = 0$. The solution set is $\{x \mid x = 3\}$.
 ii. $ax^2 + bx + c > 0$ The graph is always above the x -axis except at $x = 3$. Thus every real number except $x = 3$ is a solution. The solution set is $\{x \mid x \neq 3\}$.
- (d) i. $ax^2 + bx + c \leq 0$ The graph always lies below the x -axis so the y -values are negative and always satisfy the given inequality. The solution set is all real numbers, or $\{x \mid -\infty < x < \infty\}$.
 ii. $ax^2 + bx + c > 0$ The graph is never above the x -axis so the solution set is empty.

Now Try Exercises 1, 3, and 5 ◀

EXAMPLE 2 Solving a quadratic inequality

Solve each equation or inequality.

- (a) $2x^2 - 3x - 2 = 0$ (b) $2x^2 - 3x - 2 < 0$ (c) $2x^2 - 3x - 2 > 0$

SOLUTION

Getting Started By solving part (a) we can find the boundary numbers, which help determine the solution sets to parts (b) and (c). ▶

- (a) The equation $2x^2 - 3x - 2 = 0$ can be solved by factoring.

$$\begin{aligned} (2x + 1)(x - 2) &= 0 && \text{Factor trinomial.} \\ x = -\frac{1}{2} &\text{ or } x = 2 && \text{Zero-product property} \end{aligned}$$

The solutions are $-\frac{1}{2}$ and 2 .

- (b) The graph of $y = 2x^2 - 3x - 2$ is a parabola opening upward. Its x -intercepts are $-\frac{1}{2}$ and 2. See Figure 3.62. This parabola is below the x -axis ($y < 0$) for x -values between $-\frac{1}{2}$ and 2, so the solution set is $(-\frac{1}{2}, 2)$, or $\{x | -\frac{1}{2} < x < 2\}$.
- (c) In Figure 3.63, the graph of $y = 2x^2 - 3x - 2$ is above the x -axis ($y > 0$) for x -values less than $-\frac{1}{2}$ or greater than 2, so the solution set is $(-\infty, -\frac{1}{2}) \cup (2, \infty)$, or $\{x | x < -\frac{1}{2} \text{ or } x > 2\}$.

The table of values in Figure 3.64 supports these graphical results. Note that $y_1 = 0$ for $x = -\frac{1}{2}$ and $x = 2$. For $-\frac{1}{2} < x < 2$, $y_1 < 0$, and for $x < -\frac{1}{2}$ or $x > 2$, $y_1 > 0$.

Figure 3.62

Figure 3.63

X	Y1	
-1	3	
-.5	0	$y_1 = 0$
0	-2	
1	-3	
2	0	$y_1 = 0$
3	7	
4	18	

$Y1 = 2X^2 - 3X - 2$

Figure 3.64

NOTE It is not necessary to graph the parabola. Instead you can simply visualize the parabola opening upward with x -intercepts $-\frac{1}{2}$ and 2.

Now Try Exercise 11

CLASS DISCUSSION

Sketch a graph of $y = ax^2 + bx + c$ if the quadratic inequality $ax^2 + bx + c < 0$ satisfies the following conditions.

- (a) $a > 0$, solution set: $\{x | -1 < x < 3\}$
 (b) $a < 0$, solution set: $\{x | x \neq 1\}$
 (c) $a < 0$, solution set: $\{x | x < -2 \text{ or } x > 2\}$

EXAMPLE 3 Determining safe speeds

In the introduction to this section the quadratic inequality

$$\frac{1}{12}x^2 + \frac{11}{5}x \leq 200$$

$[-100, 100, 50]$ by $[-300, 300, 100]$

Figure 3.65

was explained. Solve this inequality to determine safe speeds on a curve where a driver can see the road ahead for at most 200 feet. What might be a safe speed limit for this curve?

SOLUTION We can solve this inequality by graphing $Y_1 = X^2/12 + 11X/5$ and $Y_2 = 200$, as shown in Figure 3.65. Since we are interested in *positive* speeds, we need to locate only the point of intersection where x is positive. This is where $x \approx 37.5$. For positive x -values to the left of $x \approx 37.5$, $y_1 < 200$. Thus safe speeds are less than 37.5 miles per hour. A reasonable speed limit might be 35 miles per hour.

Now Try Exercise 61

Symbolic Solutions

Although it is usually easier to solve a quadratic inequality graphically by visualizing a parabola and its x -intercepts, we can also solve a quadratic inequality symbolically without the aid of a graph. The symbolic method, which involves a table or line graph, is often used to solve more complicated inequalities. (See Section 4.7.)

Solving Quadratic Inequalities

STEP 1: If necessary, write the inequality as $ax^2 + bx + c < 0$, where $<$ may be replaced by $>$, \leq , or \geq .

STEP 2: Solve the equation $ax^2 + bx + c = 0$. The solutions are called boundary numbers.

STEP 3: Use the boundary numbers to separate the number line into disjoint open intervals. Note that on each open interval, $y = ax^2 + bx + c$ is either always positive or always negative.

STEP 4: To solve the inequality, choose a convenient test value (an x -value) from each disjoint interval in Step 3. Evaluate $y = ax^2 + bx + c$ at each test point. If the result is positive, then $y > 0$ over that interval. If the result is negative, then $y < 0$ over that interval. You may want to use either a number line or a table of values to organize your work.

NOTE Do not pick a boundary number for a test value, because the result will be $y = 0$.

For example, to solve $2x^2 - 5x - 12 < 0$ symbolically, replace $<$ with $=$ and solve the equation by factoring.

$$2x^2 - 5x - 12 = 0$$

$$(2x + 3)(x - 4) = 0$$

$$2x + 3 = 0 \qquad \text{or} \qquad x - 4 = 0$$

$$x = -\frac{3}{2} \qquad \text{or} \qquad x = 4$$

Quadratic equation
Factor
Zero-product property

The boundary numbers $-\frac{3}{2}$ and 4 separate the number line into three disjoint intervals: $(-\infty, -\frac{3}{2})$, $(-\frac{3}{2}, 4)$, and $(4, \infty)$, as illustrated in Figure 3.66.

The expression $2x^2 - 5x - 12$ is either always positive or always negative on a particular interval. To determine where $2x^2 - 5x - 12 < 0$, we can use the **test values** shown in Table 3.8. For example, since the test value -2 lies in the interval $(-\infty, -\frac{3}{2})$ and $2x^2 - 5x - 12$ evaluated at $x = -2$ equals 6, which is greater than 0, it follows that the expression $2x^2 - 5x - 12$ is always positive for $(-\infty, -\frac{3}{2})$. This interval has $+$ signs on the number line in Figure 3.67.

Table 3.8

Interval	Test Value x	$2x^2 - 5x - 12$	Positive or Negative?
$(-\infty, -\frac{3}{2})$	-2	6	Positive
$(-\frac{3}{2}, 4)$	0	-12	Negative
$(4, \infty)$	6	30	Positive

Algebra Review
To review factoring,
see Chapter R (page R-24).

Figure 3.66

Figure 3.67

From Table 3.8 we can see that the expression $2x^2 - 5x - 12$ is negative when $x = 0$, so it is always negative between the boundary numbers of $-\frac{3}{2}$ and 4. Negative signs are shown on the real number line in Figure 3.67 in the interval $(-\frac{3}{2}, 4)$. Finally, when $x = 6$, $2x^2 - 5x - 12 = 30$, which is greater than 0, and $+$ signs are placed along the x -axis in Figure 3.67 when $x > 4$. Therefore the solution set for $2x^2 - 5x - 12 < 0$ is $(-\frac{3}{2}, 4)$. Note that it is important to choose one test value less than $-\frac{3}{2}$, one test value between $-\frac{3}{2}$ and 4, and one test value greater than 4. You do *not* need to use both a table and a number line.

EXAMPLE 4 Solving a quadratic inequality

Solve $x^2 \geq 2 - x$ symbolically. Write the solution set in interval notation.

SOLUTION

STEP 1: Rewrite the inequality as $x^2 + x - 2 \geq 0$.

STEP 2: Solve the quadratic equation $x^2 + x - 2 = 0$.

$$(x + 2)(x - 1) = 0 \quad \text{Factor.}$$

$$x = -2 \quad \text{or} \quad x = 1 \quad \text{Zero-product property}$$

STEP 3: These two boundary numbers separate the number line into three disjoint intervals:

$$(-\infty, -2), \quad (-2, 1), \quad \text{and} \quad (1, \infty).$$

STEP 4: We choose the test values $x = -3$, $x = 0$, and $x = 2$. From Table 3.9 or Figure 3.68, the expression $x^2 + x - 2$ is positive when $x = -3$ and $x = 2$.

Figure 3.68

Table 3.9

Interval	Test Value x	$x^2 + x - 2$	Positive or Negative?
$(-\infty, -2)$	-3	4	Positive
$(-2, 1)$	0	-2	Negative
$(1, \infty)$	2	4	Positive

Therefore the expression $x^2 + x - 2$ is positive when $x < -2$ or $x > 1$. Thus the solution set is $(-\infty, -2] \cup [1, \infty)$. The boundary numbers, -2 and 1 , are included because the inequality involves \geq rather than $>$.

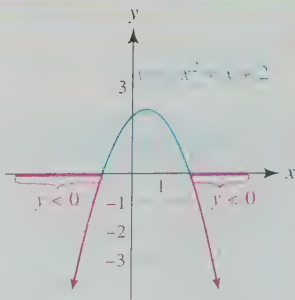

Now Try Exercise 55 ◀

3.4 Putting It All Together

The following table summarizes concepts related to solving quadratic inequalities.

Concept	Description
Quadratic inequality	Can be written as $ax^2 + bx + c < 0$, where $<$ may be replaced by $>$, \leq , or \geq . Example: $-x^2 + x < -2$ is a quadratic inequality; it can be written as $-x^2 + x + 2 < 0$.

continued from previous page

Concept	Description																
Graphical solution	<p>Write the inequality as $ax^2 + bx + c < 0$, where $<$ may be $>$, \leq, or \geq. Graph $y = ax^2 + bx + c$, and use the x-intercepts, or boundary numbers, to determine x-values where the graph is below (above) the x-axis. In the figure, the inequality $-x^2 + x + 2 < 0$ is satisfied when either $x < -1$ or $x > 2$.</p> 																
Symbolic solution	<p>Write the inequality as $ax^2 + bx + c < 0$, where $<$ may be $>$, \leq, or \geq. Solve the equation $ax^2 + bx + c = 0$. To determine where $y = ax^2 + bx + c$ is positive or negative, use a table of test values or a number line.</p> <p>Example: Solve $-x^2 + x + 2 < 0$. Solving $-x^2 + x + 2 = 0$ results in $x = -1$ or $x = 2$. From the table the solution set is $\{x \mid x < -1 \text{ or } x > 2\}$, or $(-\infty, -1) \cup (2, \infty)$.</p> <table><tr><th>Interval</th><th>Test Value x</th><th>$-x^2 + x + 2$</th><th>Positive or Negative?</th></tr><tr><td>$(-\infty, -1)$</td><td>-2</td><td>-4</td><td>Negative</td></tr><tr><td>$(-1, 2)$</td><td>0</td><td>2</td><td>Positive</td></tr><tr><td>$(2, \infty)$</td><td>3</td><td>-4</td><td>Negative</td></tr></table>	Interval	Test Value x	$-x^2 + x + 2$	Positive or Negative?	$(-\infty, -1)$	-2	-4	Negative	$(-1, 2)$	0	2	Positive	$(2, \infty)$	3	-4	Negative
Interval	Test Value x	$-x^2 + x + 2$	Positive or Negative?

3.4 Exercises

Quadratic Inequalities

Exercises 1–6: The graph of $f(x) = ax^2 + bx + c$ is shown in the figure. Solve each inequality.

1. (a) $f(x) < 0$

2. (a) $f(x) > 0$

(b) $f(x) \geq 0$

(b) $f(x) < 0$

3. (a) $f(x) \leq 0$

4. (a) $f(x) \geq 0$

(b) $f(x) > 0$

(b) $f(x) \leq 0$

5. (a) $f(x) > 0$

6. (a) $f(x) \geq 0$

(b) $f(x) < 0$

(b) $f(x) < 0$

Exercises 7–10: Use the graph of $y = f(x)$ to solve each equation or inequality. Use set-builder or interval notation to write solution sets to the inequalities.

(a) $f(x) = 0$ (b) $f(x) < 0$ (c) $f(x) > 0$

Exercises 11–22: Solve each equation and inequality. Use set-builder or interval notation to write solution sets to the inequalities.

11. (a) $x^2 - x - 12 = 0$ 12. (a) $x^2 - 8x + 12 = 0$

(b) $x^2 - x - 12 < 0$ (b) $x^2 - 8x + 12 < 0$

(c) $x^2 - x - 12 > 0$ (c) $x^2 - 8x + 12 > 0$

13. (a) $k^2 - 5 = 0$

14. (a) $n^2 - 17 = 0$

(b) $k^2 - 5 \leq 0$

(b) $n^2 - 17 \leq 0$

(c) $k^2 - 5 \geq 0$

(c) $n^2 - 17 \geq 0$

15. (a) $3x^2 + 8x = 0$ 16. (a) $7x^2 - 4x = 0$

(b) $3x^2 + 8x \leq 0$ (b) $7x^2 - 4x \leq 0$

(c) $3x^2 + 8x \geq 0$ (c) $7x^2 - 4x \geq 0$

17. (a) $-4x^2 + 12x - 9 = 0$

(b) $-4x^2 + 12x - 9 < 0$

(c) $-4x^2 + 12x - 9 > 0$

18. (a) $x^2 + 2x + 1 = 0$

(b) $x^2 + 2x + 1 < 0$

(c) $x^2 + 2x + 1 > 0$

19. (a) $12z^2 - 23z + 10 = 0$

(b) $12z^2 - 23z + 10 \leq 0$

(c) $12z^2 - 23z + 10 \geq 0$

20. (a) $18z^2 + 9z - 20 = 0$

(b) $18z^2 + 9z - 20 \leq 0$

(c) $18z^2 + 9z - 20 \geq 0$

21. (a) $x^2 + 2x - 1 = 0$

(b) $x^2 + 2x - 1 < 0$

(c) $x^2 + 2x - 1 > 0$

22. (a) $x^2 + 4x - 3 = 0$

(b) $x^2 + 4x - 3 < 0$

(c) $x^2 + 4x - 3 > 0$

Exercises 23–26: The table contains test values for a quadratic function $f(x) = ax^2 + bx + c$. Solve each inequality.

(a) $f(x) > 0$ (b) $f(x) \leq 0$

23.

x	-2	-1	0	1	2
$f(x)$	3	0	-1	0	3

24.

x	-6	-4	1	5	8
$f(x)$	-22	0	20	0	-36

25.

x	-6	-4	-2	0	2
$f(x)$	0	4	0	-12	-32

26.	x	-4	-2	0	2	4
	$f(x)$	16	0	-8	-8	0

Exercises 27–52: Solve the inequality.

27. $2x^2 + 5x + 2 \leq 0$ 28. $x^2 - 3x - 4 < 0$
 29. $x^2 + x > 6$ 30. $-3x \geq 9 - 12x^2$
 31. $x^2 \leq 4$ 32. $2x^2 > 16$
 33. $x(x - 4) \geq -4$ 34. $x^2 - 3x - 10 < 0$
 35. $-x^2 + x + 6 \leq 0$ 36. $-x^2 - 2x + 8 > 0$
 37. $6x^2 - x < 1$ 38. $5x^2 \leq 10 - 5x$
 39. $(x + 4)(x - 10) \leq 0$ 40. $(x - 3.1)(x + 2.7) > 0$
 41. $2x^2 + 4x + 3 < 0$ 42. $2x^2 + x + 4 < 0$
 43. $9x^2 + 4 > 12x$ 44. $x^2 + 2x \geq 35$
 45. $x^2 \geq x$ 46. $x^2 \geq -3$
 47. $x(x - 1) \geq 6$ 48. $x^2 - 9 < 0$
 49. $x^2 - 5 \leq 0$
 50. $0.5x^2 - 3.2x > -0.9$
 51. $7x^2 + 515.2 \geq 179.8x$
 52. $-10 < 3x - x^2$

Exercises 53–60: (Refer to Example 4.) Use a table to solve.

53. $x^2 - 9x + 14 \leq 0$ 54. $x^2 + 10x + 21 > 0$
 55. $x^2 \geq 3x + 10$ 56. $x^2 < 3x + 4$
 57. $\frac{1}{8}x^2 + x + 2 \geq 0$ 58. $x^2 - \frac{1}{2}x - 5 < 0$
 59. $x^2 > 3 - 4x$
 60. $2x^2 \leq 1 - 4x$

Applications

61. **Stopping Distance** The stopping distance D in feet for a car traveling at x miles per hour on wet level pavement can be estimated by $D(x) = \frac{1}{9}x^2 + \frac{11}{3}x$. If a driver can see only 300 feet ahead on a curve, find a safe speed limit.
62. **Safe Driving Speeds** The stopping distance d in feet for a car traveling at x miles per hour is given by $d(x) = \frac{1}{12}x^2 + \frac{11}{9}x$. Determine the driving speeds that correspond to stopping distances between 300 and 500 feet, inclusive. Round speeds to the nearest mile per hour.

63. **Geometry** The volume of a cylinder is given by $V = \pi r^2 h$, where r is the radius and h is the height. If the height of a cylindrical can is 6 inches and the volume must be between 24π and 54π cubic inches, inclusive, find the possible values for the radius of the can.

64. **Geometry** A rectangle is 4 feet longer than it is wide. If the area of the rectangle must be less than or equal to 672 square feet, find the possible values for the width x .

65. **Heart Rate** Suppose that a person's heart rate, x minutes after vigorous exercise has stopped, can be modeled by $f(x) = \frac{4}{5}(x - 10)^2 + 80$. The output is in beats per minute, where the domain of f is $0 \leq x \leq 10$.

(a) Evaluate $f(0)$ and $f(2)$. Interpret the result.

(b) Estimate the times when the person's heart rate was between 100 and 120 beats per minute, inclusive.

66. **Carbon Monoxide Exposure** When a person breathes carbon monoxide (CO), it enters the bloodstream to form carboxyhemoglobin (COHb), which reduces the transport of oxygen to tissues. The formula given by $T(x) = 0.0079x^2 - 1.53x + 76$ approximates the number of hours T that it takes for a person's bloodstream to reach the 5% COHb level, where x is the concentration of CO in the air in parts per million (ppm) and $50 \leq x \leq 100$. (Smokers routinely have a 5% concentration.) Estimate the CO concentration x necessary for a person to reach the 5% COHb level in 4–5 hours. (Source: *Indoor Air Quality Environmental Information Handbook*.)

67. **AIDS Deaths** Let $f(x) = 2375x^2 + 5134x + 5020$ estimate the number of U.S. AIDS deaths x years after 1984, where $0 \leq x \leq 1994$. Estimate when the number of AIDS deaths was from 90,000 to 200,000.

68. **Air Density** As the altitude increases, air becomes thinner, or less dense. An approximation of the density of air at an altitude of x meters above sea level is given by

$$d(x) = (3.32 \times 10^{-9})x^2 - (1.14 \times 10^{-4})x + 1.22.$$

The output is the density of air in kilograms per cubic meter. The domain of d is $0 \leq x \leq 10,000$. (Source: A. Miller and J. Thompson, *Elements of Meteorology*.)

(a) Denver is sometimes referred to as the mile-high city. Compare the density of air at sea level and in Denver. (Hint: 1 ft \approx 0.305 m.)

(b) Determine the altitudes where the density is greater than 1 kilogram per cubic meter.

69. **Modeling Water Flow** A cylindrical container measuring 16 centimeters high with a hole at the bottom was filled with water. As water leaked out, the height of the water inside the container was recorded. The results appear in the table.

Time (sec)	0	15	30	45	60
Height (cm)	16	13.8	11.6	9.8	8.1

Time (sec)	90	105	120	150	180
Height (cm)	5.3	4.1	3.1	1.4	0.5

- (a) Explain why the data cannot be modeled by a linear function.
- (b) Use the table to estimate when the height of the water was from 5 to 10 centimeters.
- (c) The height of the water can be modeled by $f(x) = 0.00036706x^2 - 0.1517x + 15.94$, where x represents the time. Graph f and the data in the same viewing rectangle.
- (d) Solve part (b) using $f(x)$.

70. **Heart Rate** The table shows a person's heart rate after exercise has stopped.

Time (min)	0	2	4
Heart rate (bpm)	154	106	90

- (a) Find values for the constants a , h , and k so that the formula $f(x) = a(x - h)^2 + k$ models the data, where x represents time and $0 \leq x \leq 4$.
- (b) Evaluate $f(1)$ and interpret the result.
- (c) Estimate the times when the heart rate was from 115 to 125 beats per minute.

Writing about Mathematics

71. Explain how a table of values can be used to help solve a quadratic inequality, provided that the boundary numbers are listed in the table.
72. Explain how to determine the solution set for the inequality $ax^2 + bx + c < 0$, where $a > 0$. How would the solution set change if $a < 0$?

CHECKING BASIC CONCEPTS FOR SECTIONS 3.3 AND 3.4

1. Simplify by using the imaginary unit i .
- (a) $\sqrt{-25}$ (b) $\sqrt{-3} \cdot \sqrt{-18}$
- (c) $\frac{7 \pm \sqrt{-98}}{14}$
2. Write each expression in standard form.
- (a) $-3i - (5 - 2i)$ (b) $(6 - 7i) + (-1 + i)$
- (c) $i(1 - i)(1 + i)$ (d) $\frac{1 + 2i}{4 - i}$
3. Use the graph of $y = f(x)$ to solve $f(x) \leq 0$ and $f(x) > 0$. Write your answer in set-builder or interval notation.

4. Solve each equation and inequality. Write the solution set for each inequality in set-builder or interval notation.
- (a) $2x^2 + 7x - 4 = 0$
- (b) $2x^2 + 7x - 4 < 0$
- (c) $2x^2 + 7x - 4 > 0$
5. Solve each inequality. Use set-builder or interval notation.
- (a) $x^2 - 5 \geq 0$
- (b) $4x^2 + 9 > 9x$
- (c) $2x(x - 1) \leq 2$

6. **Safe Driving Speeds** The stopping distance d in feet for a car traveling x miles per hour on wet level pavement can be estimated by $d(x) = \frac{1}{9}x^2 + \frac{11}{3}x$. Determine the driving speeds that correspond to stopping distances between 80 and 180 feet, inclusive.

3.5 Transformations of Graphs

- Graph functions using vertical and horizontal shifts
- Graph functions using stretching and shrinking
- Graph functions using reflections
- Combine transformations
- Model data with transformations (optional)

Introduction

Graphs are often used to model different types of phenomena. For example, when a cold front moves across the United States, we might use a circular arc on a weather map to describe its shape. (See Exercise 7 in the Extended and Discovery Exercises on page 247.) If the front does not change its shape significantly, we could model the movement of the front on a television weather map by translating the circular arc. Before we can portray a cold front on a weather map, we need to discuss how to transform graphs of functions. (Sources: S. Hoggar, *Mathematics for Computer Graphics*; A. Watt, *3D Computer Graphics*.)

Vertical and Horizontal Shifts

Graphs of $f(x) = x^2$ and $g(x) = \sqrt{x}$ will be used to demonstrate shifts, or translations, in the xy -plane. Symbolic, numerical, and graphical representations of f and g are shown in Figures 3.69 and 3.70, respectively. Points listed in the table are plotted on the graph.

x	-2	-1	0	1	2
y	4	1	0	1	4

Figure 3.69

x	0	1	4
y	0	1	2

Figure 3.70

Vertical Shifts If 2 is added to the formula for each function, the original graphs are shifted upward 2 units. The graphs of $y = x^2 + 2$ and $y = \sqrt{x} + 2$ are shown in Figures 3.71 and 3.72. A table of points is included, together with the graph of the original function. Notice that the y -values in both the graphical and numerical representations increase by 2 units.

x	-2	-1	0	1	2
y	6	3	2	3	6

Figure 3.71 Upward 2 Units

x	0	1	4
y	2	3	4

Figure 3.72 Upward 2 Units

If 2 is subtracted from each of the original formulas, the graphs are shifted downward 2 units. Verify this by graphing $y = x^2 - 2$ and $y = \sqrt{x} - 2$. Translations of this type are called **vertical shifts**, or **vertical translations**. They do not alter the shape of the graph, only its position. The original and shifted graphs are congruent.

Horizontal Shifts If the variable x is replaced by $(x - 2)$ in the formulas for f and g , a different type of shift results. Figures 3.73 and 3.74 show the graphs and tables of $y = (x - 2)^2$ and $y = \sqrt{x - 2}$, together with the graphs of the original functions.

x	0	1	2	3	4
y	4	1	0	1	4

Figure 3.73 Right 2 Units

x	2	3	6
y	0	1	2

Figure 3.74 Right 2 Units

Each new graph shows a shift of the original graph to the *right* by 2 units. Notice that a table for a graph shifted *right* 2 units can be obtained from the original table (such as the one on the preceding page) by *adding* 2 to each x -value.

If the variable x is replaced by $(x + 3)$ in each equation, the original graphs are translated to the *left* 3 units. The graphs of $y = (x + 3)^2$ and $y = \sqrt{x + 3}$ and their tables are shown in Figures 3.75 and 3.76. This type of translation is a **horizontal shift**, or **horizontal translation**. The table for a graph shifted *left* 3 units is obtained from the original table by *subtracting* 3 from each x -value.

x	-5	-4	-3	-2	-1
y	4	1	0	1	4

Figure 3.75 Left 3 Units

x	-3	-2	1
y	0	1	2

Figure 3.76 Left 3 Units

These ideas are summarized in the following box.

Vertical and Horizontal Shifts

Let f be a function, and let c be a positive number.

To Graph	Shift the Graph of $y = f(x)$ by c Units
$y = f(x) + c$	upward
$y = f(x) - c$	downward
$y = f(x - c)$	right
$y = f(x + c)$	left

Shifts can be combined to translate a graph of $y = f(x)$. For example, to shift the graph of $y = f(x)$ to the right 2 units and downward 4 units, we graph $y = f(x - 2) - 4$. If $y = |x|$, then $y = f(x - 2) - 4 = |x - 2| - 4$, as shown in Figures 3.77–3.79.

$$y = |x| \xrightarrow{\text{Shift to the right 2 units}} y = |x - 2| \xrightarrow{\text{Shift down 4 units}} y = |x - 2| - 4$$

Figure 3.77

Figure 3.78

Figure 3.79

EXAMPLE 1 Combining vertical and horizontal shifts

Find an equation that shifts the graph of $f(x) = \frac{1}{2}x^2 - 4x + 6$ to the left 8 units and upward 4 units. Do not simplify. Support your result by graphing.

SOLUTION To shift the graph of f to the left 8 units, replace x with $(x + 8)$ in the formula for $f(x)$; be sure to place parentheses around $x + 8$. To shift the graph upward 4 units, add 4 to the formula.

$$y = f(x + 8) + 4 = \frac{1}{2}(x + 8)^2 - 4(x + 8) + (6 + 4)$$

The graphs of $Y_1 = X^2/2 - 4X + 6$ and $Y_2 = (X + 8)^2/2 - 4(X + 8) + 10$ are shown in Figure 3.80. Compared to the vertex of y_1 , the vertex of y_2 is 8 units to the left and 4 units upward.

Now Try Exercise 11 ◀

$[-9, 9, 2]$ by $[-6, 6, 2]$

Figure 3.80

EXAMPLE 2 Writing formulas

Write a formula for a function g whose graph is similar to that of $f(x) = 4x^2 - 2x + 1$ but is shifted right 1980 units and upward 50 units. Do not simplify the formula.

SOLUTION Replace x with $(x - 1980)$ in the formula for $f(x)$ and then add 50.

$$\begin{aligned} g(x) &= f(x - 1980) + 50 \\ &= 4(x - 1980)^2 - 2(x - 1980) + 1 + 50 \\ &= 4(x - 1980)^2 - 2(x - 1980) + 51 \end{aligned}$$

Now Try Exercise 19 ◀

In the next example we translate a circle that is centered at the origin.

EXAMPLE 3 Translating a circle

The equation of a circle having radius 3 and center $(0, 0)$ is $x^2 + y^2 = 9$. Write an equation that shifts this circle to the right 4 units and upward 2 units. What are the center and radius of this circle? (Note that a circle is not a function.)

SOLUTION

Getting Started The standard equation for a circle with center (h, k) and radius r is

$$(x - h)^2 + (y - k)^2 = r^2.$$

If we determine the new center and radius, we can apply the standard equation. ▶

If a circle with center $(0, 0)$ and radius 3 is translated to the right 4 units and upward 2 units, then the center of the new circle is $(0 + 4, 0 + 2)$, or $(4, 2)$; the radius remains the same. The standard equation for a circle with center $(4, 2)$ and radius 3 is

$$(x - 4)^2 + (y - 2)^2 = 9.$$

Figure 3.81 illustrates this translation.

Now Try Exercise 23 ◀

Figure 3.81 Translating a Circle

Example 3 illustrates that to translate a circle horizontally c units, replace x with $(x - c)$, and to translate a circle vertically c units, replace y with $(y - c)$.

Stretching and Shrinking

Vertical Stretching and Shrinking The graph of a function can be transformed by vertical stretching or shrinking as described next.

Vertical Stretching and Shrinking

If the point (x, y) lies on the graph of $y = f(x)$, then the point (x, cy) lies on the graph of $y = cf(x)$. If $c > 1$, the graph of $y = cf(x)$ is a vertical stretching of the graph of $y = f(x)$, whereas if $0 < c < 1$, the graph of $y = cf(x)$ is a vertical shrinking of the graph of $y = f(x)$.

For example, if the point $(4, 2)$ is on the graph of $y = f(x)$, then the point $(4, 4)$ is on the graph of $y = 2f(x)$ and the point $(4, 1)$ is on the graph of $y = \frac{1}{2}f(x)$. The graph

MAKING CONNECTIONS

Vertical Stretching and Shrinking

Vertical stretching “pulls” the graph away from the x -axis.

Vertical shrinking “pushes” the graph towards the x -axis. In both cases the x -intercepts do not change.

of $f(x) = \sqrt{x}$ in Figure 3.82 can be stretched or shrunk *vertically*. In Figure 3.83, the graph of $y = 2f(x)$, or $y = 2\sqrt{x}$, represents a vertical stretching of the graph of $y = \sqrt{x}$. In Figure 3.84, the graph of $y = \frac{1}{2}f(x)$, or $y = \frac{1}{2}\sqrt{x}$, represents a vertical shrinking of the graph of $y = \sqrt{x}$. Compared to the y -values in the table for $y = \sqrt{x}$, the y -values in the tables for $y = 2f(x)$ and $y = \frac{1}{2}f(x)$ have been multiplied by 2 and $\frac{1}{2}$, respectively. The x -values have not changed.

Horizontal Stretching and Shrinking The line graph in Figure 3.85 can be stretched or shrunk *horizontally*. On one hand, if the line graph represents the graph of a function f , then the graph of $y = f(\frac{1}{2}x)$ in Figure 3.86 is a horizontal stretching of the graph of $y = f(x)$. On the other hand, the graph of $y = f(2x)$ in Figure 3.87 represents a horizontal shrinking of the graph of $y = f(x)$. Compared to the x -values in the table for $y = f(x)$, the x -values in the table for $y = f(\frac{1}{2}x)$ have been multiplied by 2 and the x -values in the table for $y = f(2x)$ have been multiplied by $\frac{1}{2}$. The y -values have not changed.

Figure 3.87 Horizontal Shrinking

Imagine the graph of $y = f(x)$ as a flexible wire. Then a horizontal stretching would happen if the wire were pulled on each end, and a horizontal shrinking would happen if the wire were compressed. Note that horizontal stretching or shrinking does not change the height (maximum or minimum y -values) of the graph, nor does it change the y -intercept. Horizontal stretching and shrinking can be generalized for any function f .

MAKING CONNECTIONS

Horizontal Stretching and Shrinking

Horizontal stretching “pulls” the graph away from the y -axis.

Horizontal shrinking “pushes” the graph towards the y -axis. In both cases the y -intercepts do not change.

Horizontal Stretching and Shrinking

If the point (x, y) lies on the graph of $y = f(x)$, then the point $(\frac{x}{c}, y)$ lies on the graph of $y = f(cx)$. If $c > 1$, the graph of $y = f(cx)$ is a horizontal shrinking of the graph of $y = f(x)$, whereas if $0 < c < 1$, the graph of $y = f(cx)$ is a horizontal stretching of the graph of $y = f(x)$.

For example, if the point $(-2, 3)$ is on the graph of $y = f(x)$, then the point $(-1, 3)$ is on the graph of $y = f(2x)$ and the point $(-4, 3)$ is on the graph of $y = f(\frac{1}{2}x)$.

EXAMPLE 4 Stretching and shrinking of a graph

Use the graph and table of $y = f(x)$ in Figure 3.88 to sketch a graph of each equation.

(a) $y = 3f(x)$ (b) $y = f(\frac{1}{2}x)$

SOLUTION

(a) The graph of $y = 3f(x)$, shown in Figure 3.89, is a vertical stretching of the graph of $y = f(x)$, shown in Figure 3.88, and can be obtained by multiplying each y -coordinate on the graph of $y = f(x)$ by 3.

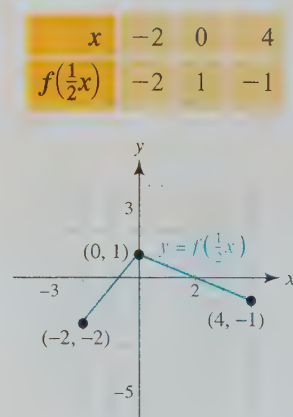

Figure 3.88

Figure 3.89 Vertical Stretching (x -intercepts unchanged)Figure 3.90 Horizontal Stretching (y -intercept unchanged)

(b) The graph of $y = f(\frac{1}{2}x)$, shown in Figure 3.90, is a horizontal stretching of the graph of $y = f(x)$, shown in Figure 3.88, and can be obtained by dividing each x -coordinate on the graph of $y = f(x)$ by $\frac{1}{2}$, which is equivalent to multiplying each x -coordinate by 2.

Now Try Exercises 33(a) and (b) ◀

Figure 3.91

Reflection of Graphs

Another type of translation is called a **reflection**. The reflection of the blue graph of $y = f(x)$ across the x -axis is shown in Figure 3.91 as a red curve.

If (x, y) is a point on the graph of f , then $(x, -y)$ lies on the graph of its reflection across the x -axis, as shown in Figure 3.91. Thus a reflection of $y = f(x)$ is given by the equation $-y = f(x)$, or equivalently, $y = -f(x)$. For example, a reflection of the graph of $f(x) = x^2 - x + 2$ is obtained by graphing $y = -f(x) = -(x^2 - x + 2)$.

If a point (x, y) lies on the graph of a function f , then the point $(-x, y)$ lies on the graph of its reflection across the y -axis, as shown in Figure 3.92. Thus a reflection of $y = f(x)$ across the y -axis is given by $y = f(-x)$. For example, a reflection of the graph of $f(x) = (x - 2)^2$ across the y -axis is shown in Figure 3.93 as a red curve. The reflection is given by the formula $f(-x) = (-x - 2)^2$.

Figure 3.92

To access the variable Y_1 as shown in Figure 3.94, see Appendix A (page AP-12).

Figure 3.94

$[-10, 10, 1]$ by $[-10, 10, 1]$

Figure 3.95

Reflections of Graphs Across the x - and y -Axes

1. The graph of $y = -f(x)$ is a reflection of the graph of $y = f(x)$ across the x -axis.
2. The graph of $y = f(-x)$ is a reflection of the graph of $y = f(x)$ across the y -axis.

On a graphing calculator capable of using function notation, entering equations for reflections of a function f is easy. For example, if $f(x) = (x - 4)^2$, let $Y_1 = (X - 4)^2$, $Y_2 = -Y_1$, and $Y_3 = Y_1(-X)$. The graph of y_2 is the reflection of f across the x -axis, and y_3 is the reflection of y_1 across the y -axis. See Figures 3.94 and 3.95. However, it is *not* necessary to have this feature to graph reflections.

NOTE Compared to the y -values in a table of values for $y = f(x)$, the y -values in a table of values for $y = -f(x)$ are negated; the x -values do *not* change. Compared to the x -values in a table of values for $y = f(x)$, the x -values in a table of values for $y = f(-x)$ are negated; the y -values do *not* change.

EXAMPLE 3 Reflecting graphs of functions

For each representation of f , graph the reflection across the x -axis and across the y -axis.

- (a) $f(x) = x^2 + 2x - 3$
- (b) The graph of f is a line graph determined by Table 3.10.

Table 3.10

x	-2	-1	0	3
$f(x)$	1	-3	-1	2

SOLUTION

- (a) The graph of $f(x) = x^2 + 2x - 3$ is a parabola with vertex $(-1, -4)$ and x -intercepts -3 and 1 , as shown in Figure 3.96. To obtain its reflection across the x -axis, graph $y = -f(x)$, or $y = -(x^2 + 2x - 3)$, as shown in Figure 3.97. The vertex is now $(-1, 4)$; the x -intercepts have not changed. To obtain the reflection of f across the y -axis, let $y = f(-x)$, or $y = (-x)^2 + 2(-x) - 3$, and graph, as shown in Figure 3.98. The vertex is now $(1, -4)$, and the x -intercepts have changed to -1 and 3 .

Figure 3.96 $y = f(x)$ Figure 3.97 $y = -f(x)$ Figure 3.98 $y = f(-x)$

- (b) The graph of $y = f(x)$ is a line graph, shown in Figure 3.99. To graph the reflection of f across the x -axis, start by making a table of values for $y = -f(x)$ by negating each y -value in the table for $f(x)$. Then plot these points and make a line graph, as in Figure 3.100.

x	-2	-1	0	3
$f(x)$	1	-3	-1	2

x	-2	-1	0	3
$-f(x)$	-1	3	1	-2

x	2	1	0	-3
$f(-x)$	1	-3	-1	2

Figure 3.99 $y = f(x)$ Figure 3.100 $y = -f(x)$ Figure 3.101 $y = f(-x)$

To graph the reflection of f across the y -axis, start by making a table of values for $y = f(-x)$ by negating each x -value in the table for $f(x)$. Then plot these points and make a line graph, as in Figure 3.101.

Now Try Exercises 69 and 73

CLASS DISCUSSION

Given a table of values for $y = f(x)$, how would you make a table of values for $y = -f(-x)$?

Combining Transformations

Transformation of graphs can be combined to create new graphs. For example, the graph of $y = -2(x - 1)^2 + 3$ can be obtained by performing four transformations on the graph of $y = x^2$.

Transforming the graph of $y = x^2$ to the graph of $y = -2(x - 1)^2 + 3$:

1. Shift the graph of $y = x^2$ to the right 1 unit: $y = (x - 1)^2$.
2. Vertically stretch the graph of $y = (x - 1)^2$ by a factor of 2: $y = 2(x - 1)^2$.
3. Reflect the graph of $y = 2(x - 1)^2$ across the x -axis: $y = -2(x - 1)^2$.
4. Shift the graph of $y = -2(x - 1)^2$ upward 3 units: $y = -2(x - 1)^2 + 3$.

These steps are summarized as follows:

The resulting sequence of graphs is shown in Figures 3.102–3.105.

Figure 3.102 Shift Right

Figure 3.103 Vertical Stretch

Figure 3.104 Reflect Across x -axis

Figure 3.105 Shift Upward

NOTE The order in which transformations are made can be important. For example, changing the order of a stretch and shift can result in a different equation and graph.

Also be careful when performing reflections and shifts. On one hand, if we reflect the graph of $y = \sqrt{x}$ across the y -axis to obtain $y = \sqrt{-x}$ and then shift it right 2 units, we obtain $y = \sqrt{-(x - 2)}$. On the other hand, if we shift the graph of $y = \sqrt{x}$ right 2 units to obtain $y = \sqrt{x - 2}$ and then reflect it across the y -axis, we obtain $y = \sqrt{-x - 2}$. The final equations are different and so are their graphs. (Try sketching each graph.)

EXAMPLE 1 Combining transformations of graphs

Describe how the graph of each equation can be obtained by transforming the graph of $y = \sqrt{x}$. Then graph the equation.

- (a) $y = -\frac{1}{2}\sqrt{x}$ (b) $y = \sqrt{-(x + 2)} - 1$

SOLUTION

- (a) Vertically shrink the graph of $y = \sqrt{x}$ by a factor of $\frac{1}{2}$ and then reflect it across the x -axis. The graphs of $y = \sqrt{x}$ and $y = -\frac{1}{2}\sqrt{x}$ are shown in Figure 3.106.
- (b) The following transformations can be used to obtain the graph of the equation $y = \sqrt{-(x+2)} - 1$ from $y = \sqrt{x}$:

1. Reflect the graph of $y = \sqrt{x}$ across the y -axis: $y = \sqrt{-x}$.
2. Shift the graph of $y = \sqrt{-x}$ left 2 units: $y = \sqrt{-(x+2)}$.
3. Shift the graph of $y = \sqrt{-(x+2)}$ down 1 unit: $y = \sqrt{-(x+2)} - 1$.

The graph of $y = \sqrt{x}$ and the resulting graph are shown in Figure 3.107.

Figure 3.106

Figure 3.107

Now Try Exercises 41 and 55

Modeling with Transformations (Optional)

Transformations of the graph of $y = x^2$ can be used to model some types of nonlinear data. By shifting, stretching, and shrinking this graph, we can transform it into a *portion of a parabola* that has the desired shape and location. In the next example we demonstrate this technique by modeling numbers of Wal-Mart employees.

EXAMPLE

Modeling data with a quadratic function

Table 3.11 lists numbers of Wal-Mart employees in millions for selected years.

- Make a scatterplot of the data.
- Use transformations of graphs to determine $f(x) = a(x - h)^2 + k$ so that $f(x)$ models the data. Graph $y = f(x)$ together with the data.
- Use $f(x)$ to estimate the number of Wal-Mart employees in 2010.

SOLUTION

- (a) A scatterplot of the data is shown in Figure 3.108 on the next page. This plot suggests that the data could be modeled by the *right half* of a parabola that opens upward.
- (b) Because the parabola opens upward, it follows that $a > 0$ and the vertex is the lowest point on the parabola. The minimum number of employees is 0.20 million in 1987. One possibility for the vertex (h, k) is $(1987, 0.20)$. Translate the graph of $y = x^2$ right 1987 units and upward 0.20 unit. Thus $f(x) = a(x - 1987)^2 + 0.20$.

To determine a , graph the data and $y = f(x)$ for different values of a . Figure 3.109 on the next page shows $y = f(x)$ with values of $a = 0.001$ and $a = 0.01$. From these graphs it can be seen that the desired value of a is between 0.001 and 0.01. With a little experimentation, a reasonable value for a near 0.005 can be found.

Table 3.11

Wal-Mart Employees (in millions)

Year	Employees
1987	0.20
1992	0.37
1997	0.68
2002	1.4
2007	2.2

Source: Wal-Mart.

A scatterplot of the data and graph of $f(x) = 0.005(x - 1987)^2 + 0.2$ are shown in Figure 3.110. (Answers may vary.)

[1985, 2010, 5] by [0, 3, 0.5]

Figure 3.108

[1985, 2010, 5] by [0, 3, 0.5]

Figure 3.109

[1985, 2010, 5] by [0, 3, 0.5]

Figure 3.110

- (c) To estimate the number of employees in 2010, evaluate $f(2010)$.

$$f(2010) = 0.005(2010 - 1987)^2 + 0.2 = 2.845$$

This model provides an estimate of about 2.8 million Wal-Mart employees in 2010. (The calculation involves extrapolation.)

Now Try Exercise 91

Translations of graphs and figures play an important role in computer graphics. In older video games, the background often is translated to give the illusion that the player in the game is moving. A simple scene of a mountain and an airplane is shown in Figure 3.111. To make it appear to the player as though the airplane were flying to the right, the image of the mountain could be translated horizontally to the left, as shown in Figure 3.112. (Source: C. Pokorny and C. Gerald, *Computer Graphics*.)

Figure 3.111

Figure 3.112

EXAMPLE 8 Using translations to model movement

Suppose that the mountain in Figure 3.111 can be described by the quadratic function represented by $f(x) = -0.4x^2 + 4$ and that the airplane is located at the point $(1, 5)$.

- Graph f in $[-4, 4, 1]$ by $[0, 6, 1]$, where the units are in kilometers. Plot a point (a scatterplot with one point) to mark the position of the airplane.
- Assume that the airplane is moving horizontally to the right at 0.4 kilometer per second. To give a video player the illusion that the airplane is moving, graph the image of the mountain and the position of the airplane after 5 seconds and then after 10 seconds.

SOLUTION

- The graph of $y = f(x) = -0.4x^2 + 4$ and the position of the airplane at $(1, 5)$ are shown in Figure 3.113. The “mountain” has been shaded to emphasize its position.

- (b) Five seconds later, the airplane has moved $5(0.4) = 2$ kilometers right. In 10 seconds it has moved $10(0.4) = 4$ kilometers right. To graph these new positions, translate the graph of the mountain 2 and 4 kilometers (units) to the left. Replace x with $(x + 2)$ and graph

$$y = f(x + 2) = -0.4(x + 2)^2 + 4$$

together with the point $(1, 5)$. Next graph $y = f(x + 4) = -0.4(x + 4)^2 + 4$. The results are shown in Figures 3.114 and 3.115. The position of the airplane at $(1, 5)$ has not changed. However, it appears to have flown to the right.

Calculator Help

To shade below a parabola, see Appendix A (page AP-12).

CLASS DISCUSSION

Discuss how one might create the illusion of the airplane moving to the left and *gaining altitude* as it passes over the mountain.

3.5 Putting It All Together

In this section we discussed several transformations of graphs. The following table summarizes how these transformations affect the graph of $y = f(x)$.

Equation	Effect on Graph of $y = f(x)$
Let $c > 0$.	
$y = f(x) + c$	Graph is shifted upward c units.
$y = f(x) - c$	Graph is shifted downward c units.
$y = f(x + c)$	Graph is shifted to the left c units.
$y = f(x - c)$	Graph is shifted to the right c units.
Examples:	

continued from previous page

Equation

Effect on Graph of $y = f(x)$

Let $c > 0$.
 $y = cf(x)$

If (x, y) lies on the graph of $y = f(x)$, then (x, cy) lies on the graph of $y = cf(x)$. The graph is vertically stretched if $c > 1$ and vertically shrunk if $0 < c < 1$.

Examples:

Let $c > 0$.
 $y = f(cx)$

If (x, y) lies on the graph of $y = f(x)$, then $(\frac{x}{c}, y)$ lies on the graph of $y = f(cx)$. The graph is horizontally shrunk if $c > 1$ and horizontally stretched if $0 < c < 1$.

Examples:

$y = -f(x)$
 $y = f(-x)$

Graph is reflected across the x -axis.
 Graph is reflected across the y -axis.

Examples:

3.5 Exercises

Vertical and Horizontal Translations

Exercises 1–8: Write the equation of the graph. (Note: The given graph is a translation of the graph of one of the following equations: $y = x^2$, $y = \sqrt{x}$, or $y = |x|$.)

Exercises 9–14: Find an equation that shifts the graph of f by the desired amounts. Do not simplify. Graph f and the shifted graph in the same xy -plane.

9. $f(x) = x^2$; right 2 units, downward 3 units

10. $f(x) = 3x - 4$; left 3 units, upward 1 unit

11. $f(x) = x^2 - 4x + 1$; left 6 units, upward 4 units

12. $f(x) = x^2 - x - 2$; right 2 units, upward 3 units

13. $f(x) = \frac{1}{2}x^2 + 2x - 1$; left 3 units, downward 2 units

14. $f(x) = 5 - 3x - \frac{1}{2}x^2$; right 5 units, downward 8 units

Exercises 15–22: (Refer to Example 2.) Write a formula for a function g whose graph is similar to $f(x)$ but satisfies the given conditions. Do not simplify the formula.

15. $f(x) = 3x^2 + 2x - 5$

(a) Shifted left 3 units

(b) Shifted downward 4 units

16. $f(x) = 2x^2 - 3x + 2$

(a) Shifted right 8 units

(b) Shifted upward 2 units

17. $f(x) = 2x^2 - 4x + 1$

(a) Shifted right 2 units and upward 4 units

(b) Shifted left 8 units and downward 5 units

18. $f(x) = 5x^2 - 3$

(a) Shifted left 10 units and downward 6 units

(b) Shifted right 1 unit and upward 10 units

19. $f(x) = 3x^2 - 3x + 2$

(a) Shifted right 2000 units and upward 70 units

(b) Shifted left 300 units and downward 30 units

20. $f(x) = |x| - 3$

(a) Shifted right 4 units and downward 3 units

(b) Shifted left 5 units and upward 2 units

21. $f(x) = \sqrt{x}$

(a) Shifted right 4 units, reflected about the x -axis

(b) Shifted left 2 units, reflected about the y -axis

22. $f(x) = \sqrt{x}$

(a) Reflected about the x -axis, shifted left 2 units

(b) Reflected about the y -axis, shifted right 3 units

Exercises 23–26: Translating Circles Write an equation that shifts the given circle in the specified manner. State the center and radius of the translated circle.

23. $x^2 + y^2 = 4$; right 3 units, downward 4 units

24. $x^2 + y^2 = 9$; right 2 units, downward 6 units

25. $x^2 + y^2 = 5$; left 5 units, upward 3 units

26. $x^2 + y^2 = 7$; left 3 units, downward 7 units

Transforming Graphical Representations

Exercises 27–34: Use the accompanying graph of $y = f(x)$ to sketch a graph of each equation.

27. (a) $y = f(x) + 2$ 28. (a) $y = f(x + 1)$

(b) $y = f(x - 2) - 1$ (b) $y = -f(x)$

(c) $y = -f(x)$ (c) $y = 2f(x)$

29. (a) $y = f(x + 3) - 2$ 30. (a) $y = f(x - 1) - 2$

(b) $y = f(-x)$ (b) $y = -f(x) + 1$

(c) $y = \frac{1}{2}f(x)$ (c) $y = f(\frac{1}{2}x)$

31. (a) $y = f(x + 1) + 1$ 32. (a) $y = f(x) - 2$

(b) $y = -f(x) - 1$ (b) $y = f(x - 1) + 2$

(c) $y = \frac{1}{2}f(2x)$ (c) $y = 2f(-x)$

33. (a) $y = f(2x) + 1$ 34. (a) $y = f(2x)$

(b) $y = 2f(\frac{1}{2}x) + 1$ (b) $y = f(\frac{1}{2}x) - 1$

(c) $y = \frac{1}{2}f(2 - x)$ (c) $y = 2f(1 - x) - 1$

Graphing Transformations of Functions

Exercises 35–44: Use transformations to explain how the graph of f can be found by using the graph of $y = x^2$, $y = \sqrt{x}$, or $y = |x|$. You do not need to graph $y = f(x)$.

35. $f(x) = (x - 3)^2 + 1$ 36. $f(x) = (x + 2)^2 - 3$

37. $f(x) = \frac{1}{4}(x + 1)^2$ 38. $f(x) = 2(x - 4)^2$

39. $f(x) = -\sqrt{x + 5}$ 40. $f(x) = -\sqrt{x} - 3$

41. $f(x) = 2\sqrt{-x}$ 42. $f(x) = \sqrt{-\frac{1}{2}x}$

43. $f(x) = |-(x + 1)|$ 44. $f(x) = |4 - x|$

Exercises 45–68: Use transformations to sketch a graph of f .

45. $f(x) = x^2 - 3$ 46. $f(x) = -x^2$

47. $f(x) = (x - 5)^2 + 3$ 48. $f(x) = (x + 4)^2$

49. $f(x) = -\sqrt{x}$ 50. $f(x) = 2(x - 1)^2 + 1$

51. $f(x) = -x^2 + 4$ 52. $f(x) = \sqrt{-x}$

53. $f(x) = |x| - 4$ 54. $f(x) = \sqrt{x} + 1$

55. $f(x) = \sqrt{x - 3} + 2$ 56. $f(x) = |x + 2| - 3$

57. $f(x) = |2x|$ 58. $f(x) = \frac{1}{2}|x|$

59. $f(x) = 1 - \sqrt{x}$ 60. $f(x) = 2\sqrt{(x-2)} - 1$
 61. $f(x) = -\sqrt{1-x}$ 62. $f(x) = \sqrt{-x} - 1$
 63. $f(x) = \sqrt{-(x+1)}$ 64. $f(x) = 2 + \sqrt{-(x-3)}$
 65. $f(x) = (x-1)^3$ 66. $f(x) = (x+2)^3$
 67. $f(x) = -x^3$ 68. $f(x) = (-x)^3 + 1$

Exercises 69–74: (Refer to Example 5.) For the given representation of a function f , graph the reflection across the x -axis and graph the reflection across the y -axis.

69. $f(x) = x^2 - 2x - 3$ 70. $f(x) = 4 - 7x - 2x^2$
 71. $f(x) = |x+1| - 1$ 72. $f(x) = \frac{1}{2}|x-2| + 2$

73. Line graph determined by the table

Transforming Numerical Representations

Exercises 75–82: Two functions, f and g , are related by the given equation. Use the numerical representation of f to make a numerical representation of g .

75. $g(x) = f(x) + 7$

x	1	2	3	4	5	6
$f(x)$	5	1	6	2	7	9

76. $g(x) = f(x) - 10$

x	0	5	10	15	20
$f(x)$	-5	11	21	32	47

77. $g(x) = f(x - 2)$

x	-4	-2	0	2	4
$f(x)$	5	2	-3	-5	-9

78. $g(x) = f(x + 50)$

x	-100	-50	0	50	100
$f(x)$	25	80	120	150	100

79. $g(x) = f(x + 1) - 2$

x	1	2	3	4	5	6
$f(x)$	2	4	3	7	8	10

80. $g(x) = f(x - 3) + 5$

x	-3	0	3	6	9
$f(x)$	3	8	15	27	31

81. $g(x) = f(-x) + 1$

x	-2	-1	0	1	2
$f(x)$	11	8	5	2	-1

82. $g(x) = -f(x + 2)$

x	-4	-2	0	2	4
$f(x)$	5	8	10	8	5

Exercises 83–90: The points $(-12, 6)$, $(0, 8)$, and $(8, -4)$ lie on the graph of $y = f(x)$. Determine three points that lie on the graph of $y = g(x)$.

83. $g(x) = f(x) + 2$

84. $g(x) = f(x) - 3$

85. $g(x) = f(x - 2) + 1$

86. $g(x) = f(x + 1) - 1$

87. $g(x) = -\frac{1}{2}f(x)$

88. $g(x) = -2f(x)$

89. $g(x) = f(-2x)$

90. $g(x) = f\left(-\frac{1}{2}x\right)$

Applications

 *Exercises 91–94: (Refer to Example 7.) Use transformations of graphs to model the table of data with the formula $f(x) = a(x - h)^2 + k$. (Answers may vary.)*

91. Percentage of malpractice awards above \$1 million

Year	1997	1998	1999	2000	2001
Percent	3.8	4.3	4.9	5.9	7.9

Source: Physician Insurers Association of America.

92. Number of titles released for DVD rentals

Year	1998	1999	2000	2001	2002
Titles	2049	4787	8723	14,321	21,260

Source: DVD Release Report.

93. Average sales price of a home in thousands of dollars

Year	1970	1980	1990	2000	2005
Price	30	80	150	210	300

Source: Bureau of the Census.

94. Average public college tuition and fees in dollars

Year	1998	2000	2002	2004	2006
Price	3247	3487	4081	5132	5836

Source: The College Board.

- 95.
- U.S. Home Ownership**
- The general trend in the percentage
- P
- of homes lived in by owners rather than renters between 1990 and 2006 is modeled by

$$P(x) = 0.00075x^2 + 0.17x + 44,$$

where $x = 0$ corresponds to 1990, $x = 1$ to 1991, and so on. Determine a function g that computes P , where x is the actual year. For example, $P(0) = 44$, so $g(1990) = 44$.

- 96.
- U.S. AIDS Deaths**
- The function
- D
- defined by

$$D(x) = 2375x^2 + 5134x + 5020$$

models AIDS deaths x years after 1984. Write a formula $g(x)$ that computes AIDS deaths during year x , where x is the actual year.

- 97.
- Daylight Hours**
- The figure shows a partial graph of the number of daylight hours at latitude
- 60°N
- . The variable
- x
- is measured in months, where
- $x = 0$
- corresponds to December 21, the day with the least amount of daylight. For example,
- $x = 2$
- represents February 21 and
- $x = -3$
- represents September 21. The domain of this function is
- $-6 \leq x \leq 6$
- . (Source: J. Williams,
- The Weather Almanac*
- .)

- (a) Estimate daylight hours on February 21.
- (b) Make a conjecture about the number of daylight hours on October 21, when $x = -2$.
- (c) Sketch the left side of the graph for $-6 \leq x \leq 0$.

- 98.
- Daylight Hours**
- (Continuation of Exercise 97) Sketch a graph that shows the daylight hours at a latitude of
- 60°S
- , which is in the Southern Hemisphere rather than in the Northern Hemisphere.

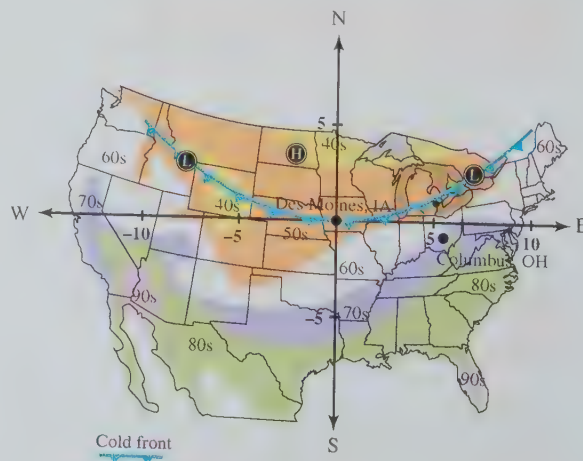

Using Transformations to Model Motion

- 99.
- Computer Graphics**
- (Refer to Example 8.) Suppose that the airplane in Figure 3.111 is flying at 0.2 kilometer per second to the left, rather than to the right. If the position of the airplane is fixed at
- $(-1, 5)$
- , graph the image of the mountain and the position of the airplane after 15 seconds.

- 100.
- Computer Graphics**
- (Refer to Example 8.) Suppose that the airplane in Figure 3.111 is traveling to the right at 0.1 kilometer per second and gaining altitude at 0.05 kilometer per second. If the airplane's position is fixed at
- $(-1, 5)$
- , graph the image of the mountain and the position of the airplane after 20 seconds.

- 101.
- Modeling a Weather Front**
- Suppose a cold front is passing through the United States at noon, with a shape described by the function
- $y = \frac{1}{20}x^2$
- . Each unit represents 100 miles. Des Moines, Iowa, is located at
- $(0, 0)$
- , and the positive
- y
- axis points north. See the figure.

- (a) If the cold front moves south at 40 miles per hour and retains its present shape, graph its location at 4 P.M.
- (b) Suppose that by midnight the vertex of the front, which is maintaining the same shape, has moved 250 miles south and 210 miles east of Des Moines. Columbus, Ohio, is located approximately 550 miles east and 80 miles south of Des Moines. Plot the locations of Des Moines and Columbus together with the new position of the cold front. Determine whether the cold front has reached Columbus by midnight.

- 102. Modeling Motion** The first figure below is a picture composed of lines and curves. In this exercise we will model only the semicircle that outlines the top of the silo. In order to make it appear that the person is walking to the right, the background must be translated horizontally to the left, as shown in the second figure.

The semicircle at the top of the silo in the first figure is described by $f(x) = \sqrt{9 - x^2} + 12$.

- (a) Graph f in the window $[-12, 12, 1]$ by $[0, 16, 1]$.
- (b) To give the illusion that the person is walking to the right at 2 units per second, graph the top of the silo after 1 second and after 4 seconds.

Writing about Mathematics

- 103.** Explain how to graph the reflection of $y = f(x)$ across the x -axis. Give an example.
- 104.** Let c be a positive number. Explain how to shift the graph of $y = f(x)$ upward, downward, left, or right c units. Give examples.

- 105.** If the graph of $y = f(x)$ undergoes a vertical stretch or shrink to become the graph of $y = g(x)$, do these two graphs have the same x -intercepts? y -intercepts? Explain your answers.
- 106.** If the graph of $y = f(x)$ undergoes a horizontal stretch or shrink to become the graph of $y = g(x)$, do these two graphs have the same x -intercepts? y -intercepts? Explain your answers.

EXTENDED AND DISCOVERY EXERCISES

Exercises 1–4: Commutative Property In the following exercises you will determine if transformations of a graph are commutative. To answer this question, start by determining if the two sequences of transformations are equivalent for all possible graphs.

1. Reflect across the x -axis, shift upward 1 unit.
Shift upward 1 unit, reflect across the x -axis.
2. Shift upward 2 units, shift left 3 units.
Shift left 3 units, shift upward 2 units.
3. Reflect across the x -axis, reflect across the y -axis.
Reflect across the y -axis, reflect across the x -axis.
4. Stretch in the vertical direction, shift downward 2 units.
Shift downward 2 units, stretch in the vertical direction.

CHECKING BASIC CONCEPTS FOR SECTION 3.5

1. Predict how the graph of each equation will appear compared to the graph of $f(x) = x^2$.
(a) $y = (x + 4)^2$ (b) $y = x^2 - 3$
(c) $y = (x - 5)^2 + 3$
2. Use the graph shown to sketch a graph of each equation.

- (a) $y = -2f(x)$ (b) $y = f\left(-\frac{1}{2}x\right)$
(c) $y = f(x - 1) + 1$

3. Write an equation that transforms the graph of $f(x) = x^2 - 4x + 1$ in the desired ways. Do not simplify.
(a) Right 3 units, downward 4 units
(b) Reflected about the x -axis
(c) Shifted left 6 units, reflected about the y -axis
(d) Reflected about the y -axis, shifted left 6 units
4. Use transformations to sketch a graph of the equation $y = \sqrt{x + 1} - 2$.
5. Use the table for $f(x)$ to make tables for $g(x)$ and $h(x)$.
(a) $g(x) = f(x - 2) + 3$ (b) $h(x) = -2f(x + 1)$

x	-4	-2	0	2	4
$f(x)$	1	3	6	8	9

3

Summary

CONCEPT

EXPLANATION AND EXAMPLES

SECTION 3.1 QUADRATIC FUNCTIONS AND MODELS

Quadratic Function

General form: $f(x) = ax^2 + bx + c$, $a \neq 0$

Examples: $f(x) = x^2$ and $f(x) = -3x^2 + x + 5$

Parabola

The graph of a quadratic function is a parabola.

Vertex form: $f(x) = a(x - h)^2 + k$ (standard form for a parabola with a vertical axis)

Leading coefficient: a ; vertex: (h, k) ; axis of symmetry: $x = h$

Example:

Completing the Square to Find the Vertex

The vertex of a parabola can be found by completing the square.

Example:

$$y = x^2 - 4x + 1$$

$$y - 1 = x^2 - 4x$$

Subtract 1.

$$y - 1 + 4 = x^2 - 4x + 4$$

$$y + 3 = (x - 2)^2$$

Perfect square trinomial!

$$y = (x - 2)^2 - 3$$

Subtract 3.

The vertex is $(2, -3)$.

Vertex Formula

$$x\text{-coordinate: } x = -\frac{b}{2a}; \quad y\text{-coordinate: } y = f\left(-\frac{b}{2a}\right)$$

Example: $f(x) = 2x^2 + 4x - 4$

$$x = -\frac{4}{2(2)} = -1, \quad y = 2(-1)^2 + 4(-1) - 4 = -6$$

Vertex: $(-1, -6)$

SECTION 3.2 QUADRATIC EQUATIONS AND PROBLEM SOLVING

Quadratic Equation

Can be written as $ax^2 + bx + c = 0$, $a \neq 0$

A quadratic equation can have zero, one, or two real solutions.

Examples: $x^2 + 1 = 0$, $x^2 + 2x + 1 = 0$, and $x(x - 1) = 20$

SECTION 3.2 QUADRATIC EQUATIONS AND PROBLEM SOLVING (CONTINUED)

Factoring

Write an equation in the form $ab = 0$ and apply the zero-product property.

Example:

$$\begin{aligned}x^2 - 3x &= -2 \\x^2 - 3x + 2 &= 0 \\(x - 1)(x - 2) &= 0 \\x = 1 &\quad \text{or} \quad x = 2\end{aligned}$$

Square Root Property

If $x^2 = k$ and $k \geq 0$, then $x = \pm\sqrt{k}$.

Example: $x^2 = 16$ implies $x = \pm 4$.**Completing the Square**

If $x^2 + kx = d$, then add $\left(\frac{k}{2}\right)^2$ to each side.

Example:

$$\begin{aligned}x^2 + 4x &= 2 & k &= -4 \\x^2 + 4x + 4 &= 2 + 4 & \text{Add } \left(\frac{-4}{2}\right)^2 &= 4. \\(x + 2)^2 &= 6 & \text{Perfect square trinomial} \\x + 2 &= \pm\sqrt{6} & \text{Square root property} \\x &= -2 \pm \sqrt{6} & \text{Add 2.}\end{aligned}$$

Quadratic Formula

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \quad \text{Always works}$$

Example: $2x^2 - 5x - 3 = 0$

$$x = \frac{-(-5) \pm \sqrt{(-5)^2 - 4(2)(-3)}}{2(2)} = \frac{5 \pm 7}{4} = 3, -\frac{1}{2}$$

Discriminant

The number of real solutions to $ax^2 + bx + c = 0$ with $a \neq 0$ can be found by evaluating the discriminant, $b^2 - 4ac$.

1. If $b^2 - 4ac > 0$, there are two real solutions.
2. If $b^2 - 4ac = 0$, there is one real solution.
3. If $b^2 - 4ac < 0$, there are no real solutions (two complex solutions).

SECTION 3.3 COMPLEX NUMBERS

Imaginary Unit

$$i = \sqrt{-1}, \quad i^2 = -1$$

Examples:

$$\begin{aligned}\sqrt{-4} &= 2i, \quad \sqrt{-7} = i\sqrt{7} \\ \sqrt{-3} \cdot \sqrt{-27} &= i\sqrt{3} \cdot i\sqrt{27} = i^2\sqrt{81} = -9\end{aligned}$$

CONCEPT**EXPLANATION AND EXAMPLES****SECTION 3.3 COMPLEX NUMBERS (CONTINUED)****Complex Conjugate**

The conjugate of $a + bi$ is $a - bi$.

Examples:

Number	$5 - 2i$	$5i$	-7	$-1 + 4i$
Conjugate	$5 + 2i$	$-5i$	-7	$-1 - 4i$

Complex Number

$a + bi$, where a and b are real numbers (standard form)

Complex numbers include all real numbers. We can add, subtract, multiply, and divide complex numbers.

Examples:

$$(2 - 3i) + (1 + 5i) = (2 + 1) + (-3 + 5)i = 3 + 2i \quad (\text{Add})$$

$$3i - (2 + i) = -2 + (3 - 1)i = -2 + 2i \quad (\text{Subtract})$$

$$(3 - i)(1 + 2i) = 3(1) + 3(2i) - i(1) - i(2i) = 5 + 5i \quad (\text{Multiply})$$

$$\frac{1 - i}{2 + i} = \frac{(1 - i)(2 - i)}{(2 + i)(2 - i)} = \frac{1 - 3i}{5} = \frac{1}{5} - \frac{3}{5}i \quad (\text{Divide})$$

Complex Solutions

The quadratic formula can be used to solve quadratic equations with complex solutions.

Example: The solutions to $x^2 - x + 2 = 0$ are

$$x = \frac{1 \pm \sqrt{(-1)^2 - 4(1)(2)}}{2(1)} = \frac{1}{2} \pm i\frac{\sqrt{7}}{2}.$$

SECTION 3.4 QUADRATIC INEQUALITIES**Quadratic Inequality**

$ax^2 + bx + c < 0$ with $a \neq 0$, where $<$ may be replaced by \leq , $>$, or \geq .

Example: $3x^2 - x + 1 \leq 0$

Graphical Solution

Graph $y = ax^2 + bx + c$ and find the x -intercepts; then determine x -values where the inequality is satisfied.

Example: Solve $-x^2 - x + 2 > 0$.

The x -intercepts are -2 and 1 .

Solution set is $\{x \mid -2 < x < 1\}$,
or $(-2, 1)$.

CONCEPT

EXPLANATION AND EXAMPLES

SECTION 3.4 QUADRATIC INEQUALITIES (CONTINUED)

Symbolic Solution

Solve $ax^2 + bx + c = 0$ and use a table of values or number line to determine the x -intervals where the inequality is satisfied.

Example: Solve $x^2 - 4 \geq 0$.

$$x^2 - 4 = 0 \text{ implies } x = \pm 2.$$

Solution set is $\{x | x \leq -2 \text{ or } x \geq 2\}$, or $(-\infty, -2] \cup [2, \infty)$.

Interval	Test Value x	$x^2 - 4$	Positive or Negative?
$(-\infty, -2)$	-3	5	Positive
$(-2, 2)$	0	-4	Negative
$(2, \infty)$	3	5	Positive

SECTION 3.5 TRANSFORMATIONS OF GRAPHS

Vertical Shifts
with $c > 0$

$y = f(x) + c$ shifts the graph of $y = f(x)$ upward c units.

$y = f(x) - c$ shifts the graph of $y = f(x)$ downward c units.

Horizontal Shifts
with $c > 0$

$y = f(x - c)$ shifts the graph of $y = f(x)$ to the right c units.

$y = f(x + c)$ shifts the graph of $y = f(x)$ to the left c units.

Vertical Stretching
and Shrinking

$y = cf(x)$ vertically stretches the graph of $y = f(x)$ when $c > 1$ and shrinks the graph when $0 < c < 1$.

Horizontal Stretching
and Shrinking

$y = f(cx)$ horizontally shrinks the graph of $y = f(x)$ when $c > 1$ and stretches the graph when $0 < c < 1$.

Reflections

$y = -f(x)$ is a reflection of $y = f(x)$ across the x -axis.

$y = f(-x)$ is a reflection of $y = f(x)$ across the y -axis.

Review Exercises

Exercises 1 and 2: Use the graph to find the following.

- Sign of the leading coefficient
- Vertex
- Axis of symmetry
- Intervals where f is increasing and where f is decreasing

Exercises 3 and 4: Write $f(x)$ in the form $f(x) = ax^2 + bx + c$, and identify the leading coefficient.

3. $f(x) = -2(x - 5)^2 + 1$ 4. $f(x) = \frac{1}{3}(x + 1)^2 - 2$

Exercises 5 and 6: Use the graph of the quadratic function f to write it as $f(x) = a(x - h)^2 + k$.

Exercises 7 and 8: Write $f(x)$ in the form $f(x) = a(x - h)^2 + k$, and identify the vertex.

7. $f(x) = x^2 + 6x - 1$ 8. $f(x) = 2x^2 + 4x - 5$

Exercises 9 and 10: Use the vertex formula to determine the vertex on the graph of f .

9. $f(x) = -3x^2 + 2x - 4$ 10. $f(x) = x^2 + 8x - 5$

Exercises 11–18: Sketch a graph of the function.

11. $f(x) = -3x^2 + 3$ 12. $g(x) = 2(x - 1)^2 - 3$

13. $h(t) = t^2 - 4t - 1$ 14. $f(x) = |x - 1| - 2$

15. $f(x) = -|x + 3|$ 16. $g(t) = 3t - t^2$

17. $f(x) = -\sqrt{x + 1}$ 18. $f(x) = \sqrt{2 - x}$

19. **Average Rate of Change** Find the average rate of change of $f(x) = -6x^2 + 7x + 5$ from 2 to 4.

20. **Difference Quotient** Find the difference quotient for $f(x) = x^2 - 2x$.

Exercises 21–32: Solve the quadratic equation.

21. $x^2 - x - 20 = 0$ 22. $3x^2 + 4x = -1$

23. $x^2 = 4x$ 24. $-5x^2 - 3x = 0$

25. $4z^2 - 7 = 0$ 26. $25z^2 = 9$

27. $-2t^2 - 3t + 14 = 0$ 28. $\frac{1}{2}t^2 + \frac{3}{4}t + \frac{1}{4} = 0$

29. $0.1x^2 - 0.3x = 1$ 30. $x(6 - x) = -16$

31. $(k - 1)^2 = \frac{9}{4}$ 32. $(k + 2)^2 = 7$

Exercises 33 and 34: The graph of $f(x) = ax^2 + bx + c$ is given.

- State whether $a > 0$ or $a < 0$.
- Estimate the real solutions to $ax^2 + bx + c = 0$.
- Is the discriminant positive, negative, or zero?

Exercises 35–40: Solve by completing the square.

35. $x^2 + 2x = 5$ 36. $x^2 - 3x = 3$

37. $2z^2 - 6z - 1 = 0$ 38. $-3z^2 - 2z + 2 = 0$

39. $\frac{1}{2}x^2 - 4x + 1 = 0$ 40. $-\frac{1}{4}x^2 - \frac{1}{2}x + 1 = 0$

41. Solve the equation $2x^2 - 3y^2 = 6$ for y . Is y a function of x ?

42. Solve $h = -\frac{1}{2}gt^2 + 100$ for t .
43. Use the imaginary unit i to simplify each expression.
 (a) $\sqrt{-16}$ (b) $\sqrt{-48}$ (c) $\sqrt{-5} \cdot \sqrt{-15}$
44. Write each expression in standard form.
 (a) $(2 - 3i) + (-3 + 3i)$
 (b) $(-5 + 3i) - (-3 - 5i)$
 (c) $(3 + 2i)(-4 - i)$ (d) $\frac{3 + 2i}{2 - i}$

Exercises 45–48: Use the graph and the given $f(x)$ to complete the following.

- (a) Find any x -intercepts.
 (b) Find the complex zeros of f .

Exercises 49 and 50: Find all complex solutions.

49. $4x^2 + 9 = 0$ 50. $2x^2 + 3 = 2x$
51. Use the graph of $y = f(x)$ to solve the inequality.
 (a) $f(x) > 0$ (b) $f(x) \leq 0$

52. The table contains test values for a quadratic function. Solve each inequality.

x	-6	-5	0	3	4
$f(x)$	9	0	-15	0	9

- (a) $f(x) < 0$ (b) $f(x) \geq 0$

53. Solve the equation or inequality.

(a) $x^2 - 3x + 2 = 0$ (b) $x^2 - 3x + 2 < 0$

(c) $x^2 - 3x + 2 > 0$

54. Solve $2x^2 + 1.3x \leq 0.4$ graphically.

Exercises 55–60: Solve the inequality. Use set-builder or interval notation to write a solution set to the inequality.

55. $x^2 - 3x + 2 \leq 0$ 56. $x^2 - 2x \geq 0$

57. $2x^2 + 3x + 1 < 0$ 58. $9x^2 - 4 > 0$

59. $n(n - 2) \geq 15$ 60. $n^2 + 4 \leq 6n$

61. If $f(x) = 2x^2 - 3x + 1$, use transformations to graph $y = -f(x)$ and $y = f(-x)$.

62. Use the given graph of $y = f(x)$ to sketch a graph of each expression.

(a) $y = f(x + 1) - 2$

(b) $y = -2f(x)$

(c) $y = f(2x)$

Exercises 63–68: Use transformations to sketch a graph of f .

63. $f(x) = x^2 - 4$ 64. $f(x) = 3|x - 2| + 1$

65. $f(x) = \sqrt{x + 2}$ 66. $f(x) = -4\sqrt{-x}$

67. $f(x) = -2(x - 2)^2 + 3$

68. $f(x) = -|x - 3|$

69. Use the table for $f(x)$ to write a table for $g(x)$, if $g(x) = -3f(x + 1) + 2$.

x	1	2	3	4
$f(x)$	-3	3	4	7

70. Sketch a graph of a quadratic function f that has axis of symmetry $x = 2$ and passes through the points $(2, 3)$ and $(4, -1)$. Find a formula for the function.

Applications

71. **Maximizing Area** A homeowner has 44 feet of fence to enclose a rectangular garden. One side of the garden needs no fencing because it is along the wall of the house. What dimensions will maximize area?
72. **Maximizing Revenue** The revenue R in dollars received from selling x radios is $R(x) = x(90 - x)$.
- Evaluate $R(20)$ and interpret the result.
 - What number of radios sold will maximize revenue?
 - What is the maximum revenue?
 - What number of radios should be sold for revenue to be \$2000 or more?
73. **Projectile** A slingshot is used to propel a stone upward so that its height h in feet after t seconds is given by $h(t) = -16t^2 + 88t + 5$.
- Evaluate $h(0)$ and interpret the result.
 - How high was the stone after 2 seconds?
 - Find the maximum height of the stone.
 - At what time(s) was the stone 117 feet high?
74. **World Population** The function given by the formula $f(x) = 0.000478x^2 - 1.813x + 1720.1$ models world population in billions from 1950 to 2000 during year x .
- Evaluate $f(1985)$ and interpret the result.
 - Estimate world population during the year 2000.
 - When might world population reach 7 billion?
75. **Construction** A box is being constructed by cutting 3-inch squares from the corners of a rectangular sheet of metal that is 4 inches longer than it is wide. If the box is to have a volume of 135 cubic inches, find the dimensions of the metal sheet.
76. **Room Prices** Room prices are regularly \$100, but for each additional room rented by a group, the price is reduced by \$3 for each room. For example, 1 room costs \$100, 2 rooms cost $2 \times \$97 = \194 , and so on.
- Write a quadratic function C that gives the total cost of renting x rooms.
 - What is the total cost of renting 6 rooms?
 - How many rooms are rented if the cost is \$730?
 - What number of rooms rented gives the greatest cost?

77. **Irrigation and Yield** The table shows how irrigation of rice crops affects yield, where x represents the percent of total area that is irrigated and y is the rice yield in tons per hectare. (1 hectare \approx 2.47 acres.)

x	0	20	40	60	80	100
y	1.6	1.8	2.2	3.0	4.5	6.1

Source: D. Grigg, *The World Food Problem*.

- Use least-squares regression to find a quadratic function that models the data.
 - Solve the equation $f(x) = 3.7$. Interpret the results.
78. **Credit Card Debt** The table lists outstanding balances on Visa and MasterCard credit cards in billions of dollars.

Year	1980	1984	1988	1992	1996
Debt	82	108	172	254	444

Source: Bankcard Holders of America.

- Does a linear function model the data?
- Find a quadratic function f that models these data. Solve the equation $f(x) = 212$. Interpret the results.

EXTENDED AND DISCOVERY EXERCISES

1. **Shooting a Foul Shot** (Refer to the introduction to this chapter.) When a basketball player shoots a foul shot, the ball follows a parabolic arc. This arc depends on both the angle and velocity with which the basketball is released. If a person shoots the basketball overhand from a position 8 feet above the floor, then the path can sometimes be modeled by the parabola

$$y = \frac{-16x^2}{0.434v^2} + 1.15x + 8,$$

where v is the velocity of the ball in feet per second, as illustrated in the figure. (Source: C. Rist, "The Physics of Foul Shots.")

- If the basketball hoop is 10 feet high and located 15 feet away, what initial velocity v should the basketball have?
- Check your answer from part (a) graphically. Plot the point $(0, 8)$ where the ball is released and the point $(15, 10)$ where the basketball hoop is. Does your graph pass through both points?
- What is the maximum height of the basketball?

2. **Shooting a Foul Shot** (Continuation of Exercise 1) If a person releases a basketball underhand from a position 3 feet above the floor, it often has a steeper arc than if it is released overhand and the path sometimes may be modeled by

$$y = \frac{-16x^2}{0.117v^2} + 2.75x + 3.$$

See the figure below. Complete parts (a), (b), and (c) from Exercise 1. Then compare the paths for an overhand shot and an underhand shot.

Exercises 3–6: Reflecting Functions Computer graphics frequently use reflections. Reflections can speed up the generation of a picture or create a figure that appears perfectly symmetrical. (Source: S. Hoggar, *Mathematics for Computer Graphics*.)

- (a) For the given $f(x)$, constant k , and viewing rectangle, graph $x = k$, $y = f(x)$, and $y = f(2k - x)$.
 (b) Generalize how the graph of $y = f(2k - x)$ compares to the graph of $y = f(x)$.

3. $f(x) = \sqrt{x}$, $k = 2$, $[-1, 8, 1]$ by $[-4, 4, 1]$

4. $f(x) = x^2$, $k = -3$, $[-12, 6, 1]$ by $[-6, 6, 1]$

5. $f(x) = x^4 - 2x^2 + 1$, $k = -6$, $[-15, 3, 1]$ by $[-3, 9, 1]$

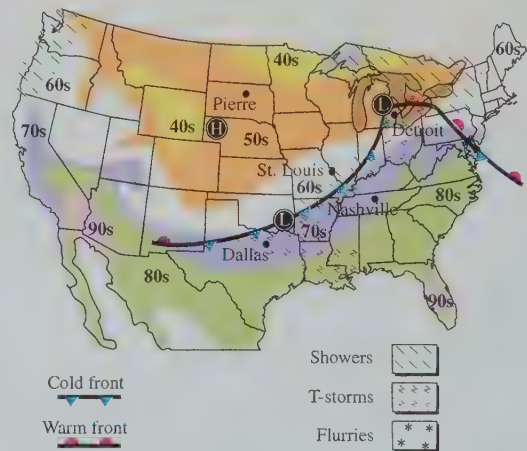

6. $f(x) = 4x - x^3$, $k = 5$, $[-6, 18, 1]$ by $[-8, 8, 1]$

7. **Modeling a Cold Front** A weather map of the United States on April 22, 1996, is shown in the figure. There was a cold front roughly in the shape of a circular arc, with a radius of about 750 miles, passing north of Dallas and west of Detroit. The center of the arc was located near Pierre, South Dakota. If Pierre has the coordinates $(0, 0)$ and the positive y -axis points north, then the equation of the front can be modeled by

$$f(x) = -\sqrt{750^2 - x^2},$$

where $0 \leq x \leq 750$. (Source: AccuWeather, Inc.)

- (a) St. Louis is located at $(535, -400)$ and Nashville is at $(730, -570)$, where units are in miles. Plot these points and graph f in the window $[0, 1200, 100]$ by $[-800, 0, 100]$. Did the cold front reach these cities?
 (b) During the next 12 hours, the center of the front moved approximately 110 miles south and 160 miles east. Assuming the cold front did not change shape, use transformations of graphs to determine an equation that models its new location.
 (c) Use graphing to determine visually if the cold front reached both cities.

More Nonlinear Functions and Equations

The wonderful things you learn in schools are the work of many generations, produced by enthusiastic effort and infinite labor in every country.

—Albert Einstein

Mathematics can be both abstract and applied. Abstract mathematics is focused on axioms, theorems, and proofs. It can be derived independently of empirical evidence. Theorems that were proved centuries ago are still valid today. In this sense, abstract mathematics transcends time. Yet, even though mathematics can be developed in an abstract setting—separate from science and all measured data—it also has countless applications.

There is a common misconception that theoretical mathematics is unimportant, yet many of the ideas that

eventually had great practical importance were first born in the abstract. For example, in 1854 George Boole published *Laws of Thought*, which outlined the basis for Boolean algebra. This was 85 years before the invention of the first digital computer. However, Boolean algebra became the basis on which modern computer hardware operates.

Much like Boolean algebra, the topic of complex numbers was at first theoretical. However, today complex numbers are used in the design of electrical circuits, ships, and airplanes. Basic quantum physics and certain features of the theory of relativity would not have been developed without complex numbers.

In this chapter we discuss some important topics in algebra that have had an impact on society. We are privileged to read in a few hours what took people centuries to discover. To ignore either the abstract beauty or the profound applicability of mathematics is like seeing a rose but never smelling one.

4.1 More Nonlinear Functions and Their Graphs

- Learn terminology about polynomial functions
- Find extrema of a function
- Identify symmetry in a graph of a function
- Determine if a function is odd, even, or neither

Introduction

Monthly average high temperatures at Daytona Beach are shown in Table 4.1.

Table 4.1 Monthly Average High Temperatures at Daytona Beach

Month	1	2	3	4	5	6	7	8	9	10	11	12
Temperature (°F)	69	70	75	80	85	88	90	89	87	81	76	70

Source: J. Williams, *The USA Weather Almanac*.

Figure 4.1 shows a scatterplot of the data. A linear function would not model these data because these data do not lie on a line. One possibility is to model the data with a quadratic function, as shown in Figure 4.2. However, a better fit can be obtained with the nonlinear function f whose graph is shown in Figure 4.3 and is given by

$$f(x) = 0.0145x^4 - 0.426x^3 + 3.53x^2 - 6.23x + 72,$$

where $x = 1$ corresponds to January, $x = 2$ to February, and so on. (Least-squares regression was used to determine $f(x)$.) Function f is a *polynomial function* with degree 4.

Figure 4.1 Temperature Data

Figure 4.2 Quadratic Model

Figure 4.3 New Nonlinear Model

Polynomial Functions

The domain of a polynomial function is all real numbers, and its graph is continuous and smooth without breaks or sharp edges.

Polynomial Function

A polynomial function f of degree n in the variable x can be represented by

$$f(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0,$$

where each coefficient a_k is a real number, $a_n \neq 0$, and n is a nonnegative integer. The **leading coefficient** is a_n and the **degree** is n .

Examples of polynomial functions include the following.

Algebra Review

To review polynomials, see Chapter R (page R-20).

Formula	Degree	Leading Coefficient
$f(x) = 10$	0	$a_0 = 10$
$g(x) = 2x - 3.7$	1	$a_1 = 2$
$h(x) = 1 - 1.4x + 3x^2$	2	$a_2 = 3$
$k(x) = -\frac{1}{2}x^6 + 4x^4 + x$	6	$a_6 = -\frac{1}{2}$

A polynomial function of degree 2 or higher is a *nonlinear* function. Functions f and g are linear, whereas functions h and k are nonlinear. As a result, polynomial functions are used to model both linear and nonlinear data.

NOTE Quadratic functions, which were discussed in Chapter 3, are examples of nonlinear functions. This chapter introduces *more* nonlinear functions.

Functions that contain radicals, ratios, or absolute values of variables are not polynomials. For example, $f(x) = 2\sqrt{x}$, $g(x) = \frac{1}{x-1}$, and $h(x) = |2x + 5|$ are *not* polynomials.

Identifying Extrema

In Figure 4.3 (page 249) the minimum monthly average temperature of 69°F occurs in January ($x = 1$) and the maximum monthly average temperature of 90°F occurs in July ($x = 7$). Minimum and maximum y -values on the graph of a function often represent important data. Graphs of polynomial functions often have “hills” or “valleys.” For example, consider the two polynomial functions f and g given by

$$f(x) = \frac{1}{2}x^2 - 2x - 4 \quad \text{and} \quad g(x) = -\frac{1}{4}x^4 + \frac{2}{3}x^3 + \frac{5}{2}x^2 - 6x.$$

Their graphs are shown in Figures 4.4 and 4.5. (Some values have been rounded.)

Figure 4.4

Figure 4.5

If one traces along the graph in Figure 4.4 from left to right, the y -values decrease until the vertex $(2, -6)$ is reached. To the right of the vertex, the y -values increase. The minimum y -value on the graph of f is -6 . It is called the *absolute minimum* of f . Function f has no *absolute maximum*; there is no largest y -value on a parabola opening upward.

In Figure 4.5 the peak of the highest “hill” on the graph of g is $(-2, 12.7)$. Therefore the absolute maximum of g is 12.7 . There is a smaller peak located at the point $(3, 2.25)$. In a small open interval near $x = 3$, the y -value of 2.25 is locally the largest. We say that g

Figure 4.6

has a *local maximum* of **2.25**. Similarly, a “valley” occurs on the graph of g , where the lowest point is $(1, -3.1)$. The value -3.1 is not the smallest y -value on the entire graph of g . Therefore it is not an absolute minimum. Rather, -3.1 is a *local minimum*.

Maximum and minimum values that are either absolute or local are called **extrema** (plural of extremum). A function may have several local extrema, but at most one absolute maximum and one absolute minimum. However, it is possible for a function to assume an absolute extremum at two values of x . In Figure 4.6 the absolute maximum is **11**. It occurs at $x = \pm 2$. Note that 11 is also a local maximum, because near $x = -2$ and $x = 2$ it is the largest y -value.

Sometimes an absolute maximum (minimum) is called a *global maximum (minimum)*. Similarly, sometimes a local maximum (minimum) is called a *relative maximum (minimum)*.

Absolute and Local Extrema

Let c be in the domain of f .

$f(c)$ is an **absolute (global) maximum** if $f(c) \geq f(x)$ for all x in the domain of f .

$f(c)$ is an **absolute (global) minimum** if $f(c) \leq f(x)$ for all x in the domain of f .

$f(c)$ is a **local (relative) maximum** if $f(c) \geq f(x)$ when x is near c .

$f(c)$ is a **local (relative) minimum** if $f(c) \leq f(x)$ when x is near c .

NOTE The expression “near c ” means that there is an open interval in the domain of f containing c where $f(c)$ satisfies the inequality.

EXAMPLE 1 Identifying and interpreting extrema

Figure 4.7 shows the graph of a function f that models the volume of air in a person’s lungs, measured in liters, after x seconds. (Source: V. Thomas, *Science and Sport*.)

- Find the absolute maximum and the absolute minimum of f . Interpret the results.
- Identify two local maxima (plural of maximum) and two local minima (plural of minimum) of f . Interpret the results.

SOLUTION

- The absolute maximum is 4 liters and occurs at C. The absolute minimum is 1 liter and occurs at D. At C a deep breath has been taken and the lungs are more inflated. After C, the person exhales until the lungs contain only 1 liter of air at D.
- One local maximum is 3 liters. It occurs at A and E and represents the amount of air in a person’s lungs after inhaling normally. One local minimum is 2 liters. It occurs at B and F and represents the amount of air after exhaling normally. Another local maximum is 4 liters, which is also the absolute maximum. Similarly, 1 liter is a local minimum and also the absolute minimum.

Now Try Exercise 91 ◀

EXAMPLE 2 Identifying extrema

Use the graph of f in Figure 4.8 to estimate any local and absolute extrema.

SOLUTION

Local Extrema The points $(-2, 8)$ and $(1, -19)$ on the graph of f correspond to the lowest point in a “valley.” Thus there are local minima of **8** and **-19**. The point $(-1, 13)$ corresponds to the highest point on a “hill.” Thus there is a local maximum of **13**.

Figure 4.7 Volume of Air in a Person’s Lungs

Figure 4.8

Calculator Help

To find a minimum or maximum point on a graph, see Appendix A (page AP-10).

[1, 12, 1] by [50, 90, 10]

Figure 4.9

[1, 12, 1] by [50, 90, 10]

Figure 4.10

Absolute Extrema Because the arrows point upward, there is no maximum y -value on the graph. Thus there is no absolute maximum. However, the minimum y -value on the graph of f occurs at the point $(1, -19)$. The absolute minimum is -19 . **Now Try Exercise 15** ◀

NOTE Extrema are y -values on the graph of a function, not x -values.

EXAMPLE 3 Modeling ocean temperatures

The monthly average ocean temperature in degrees Fahrenheit at Bermuda can be modeled by $f(x) = 0.0215x^4 - 0.648x^3 + 6.03x^2 - 17.1x + 76.4$, where $x = 1$ corresponds to January and $x = 12$ to December. The domain of f is $D = \{x \mid 1 \leq x \leq 12\}$. (Source: J. Williams, *The Weather Almanac*.)

- Graph f in $[1, 12, 1]$ by $[50, 90, 10]$.
- Estimate the absolute extrema. Interpret the results.

SOLUTION

- The graph of $Y_1 = .0215X^4 - .648X^3 + 6.03X^2 - 17.1X + 76.4$ is shown in Figure 4.9.
- Many graphing calculators have the capability to find maximum and minimum y -values. The points associated with absolute extrema are shown in Figures 4.9 and 4.10. An absolute minimum of about 61.5 corresponds to the point $(2.01, 61.5)$. This means that the monthly average ocean temperature is coldest during the month of February ($x \approx 2$) when it reaches a minimum of about 61.5°F.

An absolute maximum of approximately 82 corresponds to $(7.61, 82.0)$. Rounding, we might say that the warmest average temperature occurs during August ($x \approx 8$) when it reaches a maximum of 82°F. (Or we might say that this maximum occurs in late July, since $x \approx 7.61$.)

Now Try Exercise 93 ◀

Symmetry

Even Functions Symmetry is used frequently in art, mathematics, science, and computer graphics. Many objects are symmetric along a vertical line so that the left and right sides are mirror images. If an automobile is viewed from the front, the left side is typically a mirror image of the right side. Similarly, animals and people usually have an approximate left-right symmetry. Graphs of functions may also exhibit this type of symmetry, as shown in Figures 4.11–4.13.

Figure 4.11

Figure 4.12

Figure 4.13

If each graph were folded along the y -axis, the left and right halves would match. These graphs are **symmetric with respect to the y -axis**. A function whose graph satisfies this characteristic is called an *even function*.

Figure 4.14 An Even Function

Figure 4.14 shows a graph of an even function f . Since the graph is symmetric with respect to the y -axis, the points (x, y) and $(-x, y)$ both lie on the graph of f . Thus $f(x) = y$ and $f(-x) = y$, and so $f(x) = f(-x)$ for an even function. This means that if we change the sign of the input, the output does not change. For example, if $g(x) = x^2$, then $g(2) = g(-2) = 4$. Since this is true for *every input*, g is an even function.

Even Function

A function f is an **even function** if $f(-x) = f(x)$ for every x in its domain. The graph of an even function is symmetric with respect to the y -axis.

Odd Functions A second type of symmetry is shown in Figures 4.15–4.17. If we could spin or rotate the graph about the origin, the original graph would reappear after half a turn. These graphs are **symmetric with respect to the origin** and represent **odd functions**.

Figure 4.15

Figure 4.16

Figure 4.17

Figure 4.18 An Odd Function

In Figure 4.18 the point (x, y) lies on the graph of an odd function f . If this point spins half a turn, or 180° , around the origin, its new location is $(-x, -y)$. Thus $f(x) = y$ and $f(-x) = -y$. It follows that $f(-x) = -y = -f(x)$ for any odd function f . Changing the sign of the input changes only the sign of the output. For example, if $g(x) = x^3$, then $g(3) = 27$ and $g(-3) = -27$. Since this is true for *every input*, g is an odd function.

Odd Function

A function f is an **odd function** if $f(-x) = -f(x)$ for every x in its domain. The graph of an odd function is symmetric with respect to the origin.

Identifying Odd and Even Functions The terms *odd* and *even* have special meaning when they are applied to a polynomial function f . If $f(x)$ contains terms that have only odd powers of x , then f is an odd function. Similarly, if $f(x)$ contains terms that have only even powers of x (and possibly a constant term), then f is an even function. For example, $f(x) = x^6 - 4x^4 - 2x^2 + 5$ is an even function, whereas $g(x) = x^5 + 4x^3$ is an odd function. This can be shown *symbolically*.

CLASS DISCUSSION

If 0 is in the domain of an odd function f , what point must lie on its graph? Explain your reasoning.

$$\begin{aligned} f(-x) &= (-x)^6 - 4(-x)^4 - 2(-x)^2 + 5 \\ &= x^6 - 4x^4 - 2x^2 + 5 \\ &= f(x) \end{aligned}$$

Substitute $-x$ for x .

Simplify.

f is an even function.

$$\begin{aligned} g(-x) &= (-x)^5 + 4(-x)^3 \\ &= -x^5 - 4x^3 \\ &= -g(x) \end{aligned}$$

Substitute $-x$ for x .

Simplify

g is an odd function.

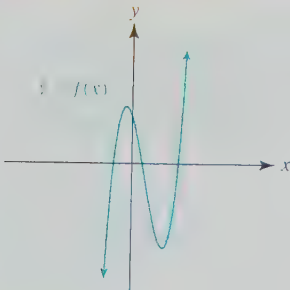

NOTE It is important to remember that the graphs of many functions exhibit *no symmetry* with respect to either the y -axis or the origin. These functions are *neither odd nor even*.

EXAMPLE 4 Identifying odd and even functions

For each representation of a function f , identify whether f is odd, even, or neither.

(a)

x	-3	-2	-1	0	1	2	3
$f(x)$	10.5	2	-0.5	-2	-0.5	2	10.5

- (b)  (c) $f(x) = x^3 - 5x$
 (d) f is the cube root function.

SOLUTION

Getting Started If either $f(-x) = f(x)$ or its graph is symmetric with respect to the y -axis, then f is even. If either $f(-x) = -f(x)$ or its graph is symmetric with respect to the origin, then f is odd. Otherwise, f is neither even nor odd. ▶

- (a) The function defined by the table has domain $D = \{-3, -2, -1, 0, 1, 2, 3\}$. Notice that $f(-3) = 10.5 = f(3)$, $f(-2) = 2 = f(2)$, and $f(-1) = -0.5 = f(1)$. The function f satisfies the statement $f(-x) = f(x)$ for every x in D . Thus f is an even function.
 (b) If we fold the graph on the y -axis, the two halves do not match, so f is not an even function. Similarly, f is not an odd function since spinning its graph half a turn about the origin does not result in the same graph. The function f is neither odd nor even.
 (c) Since f is a polynomial containing only odd powers of x , it is an odd function. This also can be shown symbolically as follows.

$$\begin{aligned}
 f(-x) &= (-x)^3 - 5(-x) && \text{Substitute } -x \text{ for } x. \\
 &= -x^3 + 5x && \text{Simplify.} \\
 &= -(x^3 - 5x) && \text{Distributive property} \\
 &= -f(x) && f \text{ is an odd function.}
 \end{aligned}$$

- (d) Note that $\sqrt[3]{-8} = -2$ and that $\sqrt[3]{8} = 2$. In general, $\sqrt[3]{-x} = -\sqrt[3]{x}$, which indicates that $f(-x) = -f(x)$, where $f(x) = \sqrt[3]{x}$. Thus f is an odd function. This fact can also be seen by graphing $f(x) = \sqrt[3]{x}$, as shown in Figure 4.19. Spinning the graph of $f(x) = \sqrt[3]{x}$ a half a turn about the origin results in the same graph.

Now Try Exercises 47, 59, 63, and 71 ◀

CLASS DISCUSSION

Discuss the possibility of the graph of a function being symmetric with respect to the x -axis.

Algebra Review

To review cube roots, see Chapter R (page R-40).

Figure 4.19

4.1 Putting It All Together

The following table summarizes some important concepts related to the graphs of nonlinear functions.

Concept	Explanation	Graphical Example
Absolute, or global, maximum (minimum)	<p>The maximum (minimum) y-value on the graph of $y = f(x)$</p> <p>A graph of a function may or may not have an absolute maximum (minimum).</p>	
Local, or relative, maximum (minimum)	<p>A maximum (minimum) y-value on the graph of $y = f(x)$ in an open interval of the domain of f</p> <p>A graph of a function may or may not have a local maximum (minimum).</p> <p>Note that it is possible for a y-value on the graph of f to be both an absolute maximum (minimum) and a local maximum (minimum).</p>	
Even function	<p>$f(-x) = f(x)$</p> <p>The graph is symmetric with respect to the y-axis. If the graph is folded on the y-axis, the left and right halves match.</p> <p>Changing the sign of the input does not change the output.</p>	
Odd function	<p>$f(-x) = -f(x)$</p> <p>The graph is symmetric with respect to the origin. If the graph is rotated about the origin, the graph reappears after half a turn.</p> <p>Changing the sign of the input changes only the sign of the output.</p>	

4.1

Exercises

Note: Many of the answers in this section involve estimations. Your answers may vary slightly, particularly when you are reading a graph.

Polynomials

Exercises 1–10: Determine if the function is a polynomial function. If it is, state its degree and leading coefficient a .

1. $f(x) = 2x^3 - x + 5$ 2. $f(x) = -x^4 + 1$

3. $f(x) = \sqrt{x}$ 4. $f(x) = 2x^3 - \sqrt[3]{x}$

5. $f(x) = 1 - 4x - 5x^4$ 6. $f(x) = 5 - 4x$

7. $g(t) = \frac{1}{t^2 + 3t - 1}$ 8. $g(t) = \frac{1}{1 - t}$

9. $g(t) = 22$ 10. $g(t) = |2t|$

Finding Extrema of Polynomials

Exercises 11–26: Use the graph of f to estimate the
(a) local extrema and (b) absolute extrema.

(Hint: Exercises 21–26: Local extrema cannot occur at endpoints because they only occur on open intervals.)

Exercises 27–38: Determine any

(a) local extrema and (b) absolute extrema.

(Hint: Consider the graph $y = g(x)$.)

27. $g(x) = 1 - 3x$ 28. $g(x) = \frac{1}{4}x$
 29. $g(x) = x^2 + 1$ 30. $g(x) = 1 - x^2$
 31. $g(x) = -2(x + 3)^2 + 4$
 32. $g(x) = \frac{1}{3}(x - 1)^2 - 2$
 33. $g(x) = 2x^2 - 3x + 1$ 34. $g(x) = -3x^2 + 4x - 1$
 35. $g(x) = |x + 3|$ 36. $g(x) = -|x| + 2$
 37. $g(x) = \sqrt[3]{x}$ 38. $g(x) = -x^3$

Exercises 39–46: Determine graphically any

(a) local extrema and (b) absolute extrema.

39. $g(x) = 3x - x^3$ 40. $g(x) = \frac{1}{1 + |x|}$
 41. $f(x) = -3x^4 + 8x^3 + 6x^2 - 24x$
 42. $f(x) = -x^4 + 4x^3 - 4x^2$
 43. $f(x) = 0.5x^4 - 5x^2 + 4.5$
 44. $f(x) = 0.01x^5 + 0.02x^4 - 0.35x^3 - 0.36x^2 + 1.8x$
 45. $f(x) = \frac{8}{1 + x^2}$ 46. $f(x) = \frac{6}{x^2 + 2x + 2}$

Symmetry

Exercises 47–50: Use the graph to determine if f is odd, even, or neither.

Exercises 51–70: Determine if f is odd, even, or neither.

51. $f(x) = 5x$ 52. $f(x) = -3x$
 53. $f(x) = x + 3$ 54. $f(x) = 2x - 1$
 55. $f(x) = x^2 - 10$ 56. $f(x) = 8 - 2x^2$
 57. $f(x) = x^4 - 6x^2 + 2$ 58. $f(x) = -x^6 + 5x^2$
 59. $f(x) = x^3 - 2x$ 60. $f(x) = -x^5$
 61. $f(x) = x^2 - x^3$ 62. $f(x) = 3x^3 - 1$
 63. $f(x) = \sqrt[3]{x^2}$ 64. $f(x) = \sqrt{-x}$
 65. $f(x) = \sqrt{1 - x^2}$ 66. $f(x) = \sqrt{x^2}$
 67. $f(x) = \frac{1}{1 + x^2}$ 68. $f(x) = \frac{1}{x}$
 69. $f(x) = |x + 2|$ 70. $f(x) = \frac{1}{x + 1}$

71. The table is a complete representation of f . Decide if f is even, odd, or neither.

x	-100	-10	-1	0	1	10	100
$f(x)$	56	-23	5	0	-5	23	-56

72. The table is a complete representation of f . Decide if f is even, odd, or neither.

x	-5	-3	-1	1	2	3
$f(x)$	-4	-2	1	1	-2	-4

73. Complete the table if f is an even function.

x	-3	-2	-1	0	1	2	3
$f(x)$	21		-25			-12	

74. Complete the table if f is an odd function.

x	-5	-3	-2	0	2	3	5
$f(x)$	13		-5			-1	

75. If the points $(-5, -6)$ and $(-3, 4)$ lie on the graph of an odd function f , then what do $f(5)$ and $f(3)$ equal?
76. If the point $(1 - a, b + 1)$ lies on the graph of an even function f , then what does $f(a - 1)$ equal?

Concepts

77. Sketch a graph of an odd linear function.
78. Sketch a graph of an even linear function.
79. Does there exist a continuous odd function that is always increasing and whose graph passes through the points $(-3, -4)$ and $(2, 5)$? Explain.
80. Is there an even function whose domain is all real numbers and that is always decreasing? Explain.
81. Sketch a graph of a continuous function with an absolute minimum of -3 at $x = -2$ and a local minimum of -1 at $x = 2$.
82. Sketch a graph of a continuous function with no absolute extrema but with a local minimum of -2 at $x = -1$ and a local maximum of 2 at $x = 1$.
83. Sketch a graph of a continuous function that is increasing on $(-\infty, 2]$ and decreasing on $[2, \infty)$. Could this function be quadratic?
84. Sketch a graph of a continuous function with a local maximum of 2 at $x = -1$ and a local maximum of 0 at $x = 1$.

Translations of Graphs

Exercises 85–88: Use the graph of $f(x) = 4x - \frac{1}{3}x^3$ and translations of graphs to sketch the graph of the equation.

85. $y = f(x + 1)$ 86. $y = f(x) - 2$
87. $y = 2f(x)$ 88. $y = f\left(\frac{1}{2}x\right)$
89. If the graph of $y = f(x)$ is increasing on $[1, 4]$, then where is the graph of $y = f(x + 1) - 2$ increasing? Where is the graph of $y = -f(x - 2)$ decreasing?
90. If the graph of f is decreasing on $[0, \infty)$, then what can be said about the graph of $y = f(-x) + 1$? the graph of $y = -f(x) - 1$?

Applications

91. **Temperature in the Sun** The graph shows the temperature readings of a thermometer in the sun (on a partly cloudy day) x hours past noon.

- (a) Identify the absolute maximum and minimum. Interpret each.
- (b) Identify any local maxima and minima. (Do not consider the endpoints.)
- (c) For what x -values was the temperature increasing?
92. **Daytona Beach** (Refer to the introduction to this section.) The graph at the top of the next page shows the monthly average high temperatures at Daytona Beach.

- Identify the absolute maximum and minimum.
- Identify a local maximum.
- For what x -values was the temperature increasing?

- 93. Heating Costs** In colder climates the cost for natural gas to heat homes can vary from one month to the next. The polynomial function given by

$$f(x) = -0.1213x^4 + 3.462x^3 - 29.22x^2 + 64.68x + 97.69$$

models the monthly cost in dollars of heating a typical home. The input x represents the month, where $x = 1$ corresponds to January and $x = 12$ to December. (Source: Minnegasco.)

- Where might the absolute extrema occur for $1 \leq x \leq 12$?
 - Graph f in $[1, 12, 1]$ by $[0, 150, 10]$. Find the absolute extrema and interpret the results.
- 94. U.S. Birth Rate** From 1900 to 2005, the birth rate (births per 1000 people) x years after 1900 can be approximated by

$$f(x) = -0.0000285x^3 + 0.0057x^2 - 0.48x + 34.4.$$

(Source: National Center for Health Statistics.)

- Evaluate $f(65)$ and interpret your result.
- If the domain of f is $1900 \leq x \leq 2005$, identify the absolute extrema. Interpret each.

- 95. Energy** The U.S. consumption of energy from 1950 to 1980 can be modeled by

$$f(x) = -0.00113x^3 + 0.0408x^2 - 0.0432x + 7.66,$$

where $x = 0$ corresponds to 1950 and $x = 30$ to 1980. Consumption is measured in quadrillion Btu. (Source: Department of Energy.)

- Evaluate $f(5)$ and interpret the result.
- Graph f in $[0, 30, 5]$ by $[6, 16, 1]$. Describe the energy usage during this time period.
- Approximate the local maximum and interpret it.

- 96. Natural Gas** The U.S. consumption of natural gas from 1965 to 1980 can be modeled by

$$f(x) = 0.0001234x^4 - 0.005689x^3 + 0.08792x^2 - 0.5145x + 1.514,$$

where $x = 6$ corresponds to 1966 and $x = 20$ to 1980. Consumption is measured in trillion cubic feet. (Source: Department of Energy.)

- Evaluate $f(10)$ and interpret the result.
- Graph f in $[6, 20, 5]$ by $[0.4, 0.8, 0.1]$. Describe the energy usage during this time period.
- Determine the local extrema and interpret the results.

- 97. Average Temperature** The graph approximates the monthly average temperatures in degrees Fahrenheit in Austin, Texas. In this graph x represents the month, where $x = 0$ corresponds to July.

- Is this a graph of an odd or even function?
- June corresponds to $x = -1$ and August to $x = 1$. The average temperature in June is 83°F . What is the average temperature in August?
- March corresponds to $x = -4$ and November to $x = 4$. According to the graph, how do their average temperatures compare?
- Interpret what this type of symmetry implies about average temperatures in Austin.

98. **Height of a Projectile** When a projectile is shot into the air, it attains a maximum height and then falls back to the ground. Suppose that $x = 0$ corresponds to the time when the projectile's height is maximum. If air resistance is ignored, its height h above the ground at any time x may be modeled by $h(x) = -16x^2 + h_{\max}$, where h_{\max} is the projectile's maximum height above the ground. Height is measured in feet and time in seconds. Let $h_{\max} = 400$ feet.

- Evaluate $h(-2)$ and $h(2)$. Interpret these results.
- Evaluate $h(-5)$ and $h(5)$. Interpret these results.
- Graph h for $-5 \leq x \leq 5$. Is h even or odd?
- How do $h(x)$ and $h(-x)$ compare when $-5 \leq x \leq 5$? What does this result indicate?

Writing about Mathematics

- Explain the difference between a local and an absolute maximum. Are extrema x -values or y -values?
- Describe ways to determine if a polynomial function is odd, even, or neither. Give examples.
- If an odd function f has one local maximum of 5 at $x = 3$, then what else can be said about f ? Explain.
- If an even function f has an absolute minimum of -6 at $x = -2$, then what else can be said about f ? Explain.

EXTENDED AND DISCOVERY EXERCISES

- Find the dimensions of the rectangle of maximum area that can be inscribed in a semicircle with radius 3. Assume that the rectangle is positioned as shown in the accompanying figure.

2. **Minimizing Area** A piece of wire 20 inches long is cut into two pieces. One piece is bent into a square and the other is bent into an equilateral triangle, as illustrated.

- Write a formula that gives the area A of the two shapes in terms of x .
- Find the length of wire (to the nearest tenth of an inch) that should be used for the square if the combined area of the two shapes is to be minimized?

3. **Minimizing Time** A person is in a rowboat 3 miles from the closest point on a straight shoreline, as illustrated in the figure. The person would like to reach a cabin that is 8 miles down the shoreline. The person can row at 4 miles per hour and jog at 7 miles per hour.

- How long will it take to reach the cabin if the person rows straight toward shore at point A and then jogs to the cabin?
- How long will it take to reach the cabin if the person rows straight to the cabin and does no jogging?
- Find the minimum time to reach the cabin.

4.2 Polynomial Functions and Models

- Understand the graphs of polynomial functions
- Evaluate and graph piecewise-defined functions
- Use polynomial regression to model data (optional)

Introduction

The consumption of natural gas by the United States has varied over past decades. As shown in Table 4.2, energy consumption (in quadrillion Btu) increased, decreased, and then increased again. A scatterplot of the data is shown in Figure 4.20, and one possibility for a polynomial modeling function f is shown in Figure 4.21. Notice that f is neither linear nor quadratic. What degree of polynomial might we use to model these data? This question is answered in Example 4.

Table 4.2 Natural Gas Consumption

Year	1960	1970	1980	1990	2000
Consumption	12.4	21.8	20.4	19.3	24.0

Source: Department of Energy.

Figure 4.20 A Scatterplot

Figure 4.21 A Modeling Function

Graphs of Polynomial Functions

In Section 4.1 polynomial functions were defined. Their graphs are continuous and smooth; they have no breaks or sharp edges. The domain of a polynomial function is *all* real numbers. A polynomial function f of degree n can be expressed as

$$f(x) = a_n x^n + \cdots + a_2 x^2 + a_1 x + a_0,$$

where each coefficient a_k is a real number, $a_n \neq 0$, and n is a nonnegative integer. The *leading coefficient* is a_n , where n is the largest exponent of x .

The expression $a_n x^n + \cdots + a_2 x^2 + a_1 x + a_0$ is a **polynomial of degree n** and the equation $a_n x^n + \cdots + a_2 x^2 + a_1 x + a_0 = 0$ is a **polynomial equation of degree n** . Thus f is a *polynomial function*, $f(x)$ is a *polynomial*, and $f(x) = 0$ is a *polynomial equation*. For example, the function f , given by $f(x) = x^3 - 3x^2 + x - 5$, is a polynomial function, $x^3 - 3x^2 + x - 5$ is a polynomial, and $x^3 - 3x^2 + x - 5 = 0$ is a polynomial equation.

A **turning point** occurs whenever the graph of a polynomial function changes from increasing to decreasing or from decreasing to increasing. Turning points are associated with “hills” or “valleys” on a graph. The y -value at a turning point is either a local maximum or a local minimum of the function. In Figure 4.22 the graph has two turning points, $(-2, 8)$ and $(2, -8)$. A local maximum is **8** and a local minimum is **-8**.

We discuss the graphs of polynomial functions, starting with degree 0 and continuing to degree 5. Look for patterns in the graphs of these polynomial functions.

Figure 4.22

Constant Polynomial Functions If $f(x) = a$ and $a \neq 0$, then f is both a constant function and a polynomial function of degree 0. (If $a = 0$, then f has an **undefined degree**.) Its graph is a horizontal line that does not coincide with the x -axis. Graphs of $f(x) = 4$ and $g(x) = -3$ are shown in Figures 4.23 and 4.24. A graph of a polynomial function of degree 0 has no x -intercepts or turning points.

Figure 4.25 Linear, $a > 0$ Figure 4.26 Linear, $a < 0$ Figure 4.23 Constant, $a > 0$ Figure 4.24 Constant, $a < 0$

Linear Polynomial Functions If $f(x) = ax + b$ and $a \neq 0$, then f is both a linear function and a polynomial function of degree 1. Its graph is a line that is neither horizontal nor vertical. The graphs of $f(x) = 2x - 3$ and $g(x) = -1.6x + 5$ are shown in Figures 4.25 and 4.26. A polynomial function of degree 1 has one x -intercept and no turning points.

The graph of $f(x) = ax + b$ with $a > 0$ is a line sloping upward from left to right. As one traces from left to right, the y -values become larger without a maximum. We say that the **end behavior** of the graph tends to $-\infty$ on the left and ∞ on the right. (Strictly speaking, the graph of a polynomial has infinite length and does not have an end.) More formally, we say that $f(x) \rightarrow -\infty$ as $x \rightarrow -\infty$ and $f(x) \rightarrow \infty$ as $x \rightarrow \infty$.

If $a < 0$, then the end behavior is switched. The line slopes downward from left to right. The y -values on the left side of the graph become large positive values without a maximum and the y -values on the right side become negative without a minimum. The end behavior tends to ∞ on the left and $-\infty$ on the right, or $f(x) \rightarrow \infty$ as $x \rightarrow -\infty$ and $f(x) \rightarrow -\infty$ as $x \rightarrow \infty$.

Quadratic Polynomial Functions If $f(x) = ax^2 + bx + c$ and $a \neq 0$, then f is both a quadratic function and a polynomial function of degree 2. Its graph is a parabola that opens either upward ($a > 0$) or downward ($a < 0$). The graphs of $f(x) = 0.5x^2 + 2$, $g(x) = x^2 + 4x + 4$, and $h(x) = -x^2 + 3x + 4$ are shown in Figures 4.27–4.29, respectively. Quadratic functions can have zero, one, or two x -intercepts. A parabola has exactly one turning point, which is also the vertex.

Figure 4.27 Quadratic, $a > 0$ Figure 4.28 Quadratic, $a > 0$ Figure 4.29 Quadratic, $a < 0$

If $a > 0$, as in Figure 4.27, then both sides of the graph go up. The end behavior tends to ∞ on both sides, or $f(x) \rightarrow \infty$ as $x \rightarrow \pm\infty$. If $a < 0$, as in Figure 4.29, then the end behavior is switched and tends to $-\infty$ on both sides, or $f(x) \rightarrow -\infty$ as $x \rightarrow \pm\infty$.

Cubic Polynomial Functions If $f(x) = ax^3 + bx^2 + cx + d$ and $a \neq 0$, then f is both a **cubic function** and a polynomial function of degree 3. The graph of a cubic function can have zero or two turning points. The graph of $f(x) = -x^3 + 4x + 1$ in Figure 4.30 has two turning points, whereas the graph of $g(x) = \frac{1}{4}x^3$ in Figure 4.31 has no turning points.

Figure 4.30 Cubic, $a < 0$ Figure 4.31 Cubic, $a > 0$ Figure 4.32 Cubic, $a > 0$

If $a > 0$, the graph of a cubic function falls to the left and rises to the right, as in Figure 4.31. If $a < 0$, its graph rises to the left and falls to the right, as in Figure 4.30. The end behavior of a cubic function is similar to that of a linear function, tending to ∞ on one side and $-\infty$ on the other. Therefore its graph must cross the x -axis at least once. A cubic function can have up to three x -intercepts. The graph of $h(x) = x^3 - x^2 - x + 1$ in Figure 4.32 has two x -intercepts.

Quartic Polynomial Functions If $f(x) = ax^4 + bx^3 + cx^2 + dx + e$ and $a \neq 0$, then f is both a **quartic function** and a polynomial function of degree 4. The graph of a quartic function can have up to four x -intercepts and three turning points; the graph of $f(x) = \frac{1}{2}x^4 + \frac{7}{2}x^3 + 7x^2 + 4x$ in Figure 4.33 is an example. The graph in Figure 4.34 of $g(x) = -x^4 + 2x^3$ has one turning point and two x -intercepts, and the graph in Figure 4.35 of $h(x) = -x^4 + x^3 + 3x^2 - x - 2$ has three turning points and three x -intercepts.

If $a > 0$, then both ends of the graph of a quartic function go up, as in Figure 4.33. If $a < 0$, then both ends of its graph go down, as in Figures 4.34 and 4.35. The end behaviors of quartic and quadratic functions are similar.

CLASS DISCUSSION

Can a quartic function have both an absolute maximum and an absolute minimum? Explain.

Figure 4.33 Quartic, $a > 0$ Figure 4.34 Quartic, $a < 0$ Figure 4.35 Quartic, $a < 0$

Quintic Polynomial Functions If $f(x) = ax^5 + bx^4 + cx^3 + dx^2 + ex + k$ and $a \neq 0$, then f is both a **quintic function** and a polynomial function of degree 5. The graph of a quintic function may have up to five x -intercepts and four turning points. An example is shown in Figure 4.36, given by $f(x) = x^5 - 5x^3 + 4x$. Other quintic functions are shown in Figures 4.37 and 4.38. They are defined by

$$g(x) = \frac{1}{5}x^5 - 3 \quad \text{and} \quad h(x) = -\frac{1}{2}x^5 - \frac{1}{2}x^4 + \frac{5}{2}x^3 + \frac{1}{2}x^2 - 4x + 2.$$

The function g has one x -intercept and no turning points. The graph of h appears to have two x -intercepts and two turning points. Notice that the end behavior of a quintic function is similar to that of linear and cubic functions.

Figure 4.36 Quintic, $a > 0$

Figure 4.37 Quintic, $a > 0$

Figure 4.38 Quintic, $a < 0$

The end behavior of polynomial functions is summarized in the following.

CLASS DISCUSSION

Can you sketch the graph of a quadratic function with no turning points, a cubic function with one turning point, or a quartic function with two turning points? Explain.

End Behavior of Polynomial Functions

Let f be a polynomial function with leading coefficient a and degree n .

1. $n \geq 2$ is even.

$a > 0$ implies that the graph of f rises both to the left and to the right. That is, $f(x) \rightarrow \infty$ as $x \rightarrow \pm\infty$.

$a < 0$ implies that the graph of f falls both to the left and to the right. That is, $f(x) \rightarrow -\infty$ as $x \rightarrow \pm\infty$.

2. $n \geq 1$ is odd.

$a > 0$ implies that the graph of f falls to the left and rises to the right. That is, $f(x) \rightarrow -\infty$ as $x \rightarrow -\infty$ and $f(x) \rightarrow \infty$ as $x \rightarrow \infty$.

$a < 0$ implies that the graph of f rises to the left and falls to the right. That is, $f(x) \rightarrow \infty$ as $x \rightarrow -\infty$ and $f(x) \rightarrow -\infty$ as $x \rightarrow \infty$.

The maximum numbers of x -intercepts and turning points on the graph of a polynomial function of degree n can be summarized as follows.

Degree, x -intercepts, and Turning Points

The graph of a polynomial function of degree n , with $n \geq 1$, has at most n x -intercepts and at most $n - 1$ turning points.

EXAMPLE 1 Analyzing the graph of a polynomial function

Figure 4.39 shows the graph of a polynomial function f .

- How many turning points and x -intercepts are there?
- Is the leading coefficient a positive or negative? Is the degree odd or even?
- Determine the minimum possible degree of f .

Figure 4.39

SOLUTION

- There are four turning points corresponding to the two “hills” and two “valleys.” There appear to be four x -intercepts.
- The left side of the graph rises and the right side falls. Therefore $a < 0$ and the polynomial function has odd degree.
- The graph has four turning points. A polynomial of degree n can have at most $n - 1$ turning points. Therefore f must be at least degree 5.

Now Try Exercise 7

NOTE More examples of graphs of polynomials are found in the “Putting It All Together” for this section.

EXAMPLE 2 Analyzing the graph of a polynomial function

Graph $f(x) = x^3 - 2x^2 - 5x + 6$, and then complete the following.

- Identify the x -intercepts.
- Approximate the coordinates of any turning points to the nearest hundredth.
- Use the turning points to approximate any local extrema.

SOLUTION

- A graph of f , shown in Figure 4.40, appears to intersect the x -axis at the points $(-2, 0)$, $(1, 0)$, and $(3, 0)$. Therefore the x -intercepts are -2 , 1 , and 3 .
- There are two turning points. From Figures 4.41 and 4.42 their coordinates are approximately $(-0.79, 8.21)$ and $(2.12, -4.06)$.
- There is a local maximum of about 8.21 and a local minimum of about -4.06 .

Calculator Help

To find a minimum or a maximum point on a graph, see Appendix A (page AP-10).

$[-10, 10, 1]$ by $[-10, 10, 1]$

Figure 4.40

$[-10, 10, 1]$ by $[-10, 10, 1]$

Figure 4.41

$[-10, 10, 1]$ by $[-10, 10, 1]$

Figure 4.42

Now Try Exercise 25

EXAMPLE 3 Analyzing the end behavior of a graph

Let $f(x) = 2 + 3x - 3x^2 - 2x^3$.

- Give the degree and leading coefficient.
- State the end behavior of the graph of f .

SOLUTION

- Rewriting gives $f(x) = -2x^3 - 3x^2 + 3x + 2$. The term with highest degree is $-2x^3$, so the degree is **3** and the leading coefficient is **-2**.
- The degree of $f(x)$ is odd, and the leading coefficient is negative. Therefore the graph of f rises to the left and falls to the right. More formally,

$$f(x) \rightarrow \infty \text{ as } x \rightarrow -\infty \quad \text{and} \quad f(x) \rightarrow -\infty \text{ as } x \rightarrow \infty.$$

This conclusion is supported by Figure 4.43.

Now Try Exercise 33

Figure 4.43 Cubic with $a < 0$

An Application In the next example, we analyze the data presented in the introduction to this section.

EXAMPLE 4 Modeling natural gas consumption

Figure 4.20, which shows natural gas consumption from 1960 to 2000, is repeated in the margin.

- Could a linear or quadratic function model the data?
- What minimum degree polynomial might be appropriate to model the data?
- Should the leading coefficient a be positive or negative?

SOLUTION

- The data clearly do not lie on a line, so a linear function is not appropriate. Because natural gas consumption increases, decreases, and then increases, a quadratic function would not be a good choice either. The data are not U-shaped or \cap -shaped.
- Because the data increase, decrease, and then increase, a polynomial with at least two turning points would be appropriate. A cubic, or degree 3, polynomial is a possibility for a modeling function.
- The leading coefficient a should be positive because the data fall to the left and rise to the right. (If the data decreased, increased, and then decreased, a negative leading coefficient would be appropriate.)

Now Try Exercises 39(a), (b), and (c)

Concavity (Optional) Graphs of polynomial functions with degree 2 or greater are curves. **Concavity** is a mathematical description of how a curve bends. A line exhibits no, or zero, concavity because it is straight. A parabola that opens upward is said to be **concave upward** everywhere on its domain. See Figure 4.44. A parabola that opens downward is said to be **concave downward** everywhere on its domain. See Figure 4.45. A graph of a higher degree polynomial can be concave upward on one interval of its domain and concave downward on a different interval of its domain. See Figure 4.46, where the graph of $f(x) = 4x - x^3$ is concave upward on the interval $(-\infty, 0)$, shown in blue, and concave downward on $(0, \infty)$, shown in red. Concavity is usually defined for *open* intervals. Determining the exact x -value where a graph switches from concave upward to downward or vice versa can be difficult to do visually and often requires techniques learned in calculus. (See Extended and Discovery Exercises 2–7 for this section.)

Figure 4.44

Figure 4.45

Figure 4.46

Piecewise-Defined Polynomial Functions

In Section 2.1 piecewise-defined functions were discussed. If each piece is a polynomial, then the function is a **piecewise-defined polynomial function** or **piecewise-polynomial function**. An example is given by $f(x)$.

$$f(x) = \begin{cases} x^3 & \text{if } x < 1 \\ x^2 - 1 & \text{if } x \geq 1 \end{cases}$$

One way to graph f is to first graph $y = x^3$ and $y = x^2 - 1$, as shown in Figures 4.47 and 4.48. Then the graph of f is found by using the portion of $y = x^3$ for $x < 1$ and the portion of $y = x^2 - 1$ for $x \geq 1$, as illustrated in Figure 4.49. At $x = 1$ there is a break in the graph, where the graph of f is discontinuous.

Figure 4.47

Figure 4.48

Figure 4.49

EXAMPLE 5 Evaluating a piecewise-defined polynomial function

Evaluate $f(x)$ at $x = -3, -2, 1$, and 2 .

$$f(x) = \begin{cases} x^2 - x & \text{if } -5 \leq x < -2 \\ -x^3 & \text{if } -2 \leq x < 2 \\ 4 - 4x & \text{if } 2 \leq x \leq 5 \end{cases}$$

SOLUTION To evaluate $f(-3)$ we use the formula $f(x) = x^2 - x$, because -3 is in the interval $-5 \leq x < -2$.

$$f(-3) = (-3)^2 - (-3) = 12$$

To evaluate $f(-2)$ we use $f(x) = -x^3$, because -2 is in the interval $-2 \leq x < 2$.

$$f(-2) = -(-2)^3 = -(-8) = 8$$

Similarly, $f(1) = -1^3 = -1$ and $f(2) = 4 - 4(2) = -4$.

Now Try Exercise 73 ◀

EXAMPLE 5 Graphing a piecewise-defined function

Complete the following.

- Sketch a graph of f .
- Determine if f is continuous on its domain.
- Solve the equation $f(x) = 1$.

$$f(x) = \begin{cases} \frac{1}{2}x^2 - 2 & \text{if } -4 \leq x \leq 0 \\ 2x - 2 & \text{if } 0 < x < 2 \\ 2 & \text{if } 2 \leq x \leq 4 \end{cases}$$

Figure 4.50

Figure 4.51

SOLUTION

- For the first piece, graph the parabola determined by $y = \frac{1}{2}x^2 - 2$ on the interval $-4 \leq x \leq 0$. Place dots at the endpoints, which are $(-4, 6)$ and $(0, -2)$. See Figure 4.50. For the second piece, graph the line determined by $y = 2x - 2$. Place open circles at $(0, -2)$ and $(2, 2)$. Note that the left endpoint of the middle piece coincides with the right endpoint of the first piece. Finally, graph the horizontal line $y = 2$ from the points $(2, 2)$ to $(4, 2)$. Note that the left endpoint of the third piece coincides with the open circle on the right for the middle piece.
- The domain of f is $-4 \leq x \leq 4$. Because there are no breaks in the graph of f on its domain, the graph of f is continuous.
- The horizontal line $y = 1$ intersects the graph of $y = f(x)$ at two points, as shown in Figure 4.51. The x -coordinates of these two points of intersection can be found by solving the equations

$$\frac{1}{2}x^2 - 2 = 1 \quad \text{and} \quad 2x - 2 = 1.$$

The solutions are $-\sqrt{6} \approx -2.45$ and $\frac{3}{2}$.

Now Try Exercise 79 ◀

Polynomial Regression (Optional)

We now have the mathematical understanding to model the data presented in the introduction to this section. The polynomial modeling function f (shown in Figure 4.21 and repeated in the margin) falls to the left and rises to the right, so it has odd degree and the leading coefficient is positive. Since the graph of f has two turning points, it must be at least degree 3. A cubic polynomial $f(x)$ is a possible choice, where

$$f(x) = ax^3 + bx^2 + cx + d.$$

Using trial and error would be a difficult way to find values for a , b , c , and d . Instead, we can use least-squares regression, which was also discussed in Sections 2.1 and 3.1, for linear and quadratic functions. The next example illustrates *cubic regression*.

EXAMPLE 7 Determining a cubic modeling function

The data in Table 4.2 (repeated in the margin) list natural gas consumption.

Year	Consumption
1960	12.4
1970	21.8
1980	20.4
1990	19.3
2000	24.0

- Find a polynomial function of degree 3 that models the data.
- Graph f and the data together.
- Estimate natural gas consumption in 1974 and in 2007. Compare these estimates to the actual values of 21.2 and 23.0 quadrillion Btu, respectively.
- Did your estimates in part (c) involve interpolation or extrapolation? Is there a problem with using higher degree polynomials ($n \geq 3$) for extrapolation? Explain.

SOLUTION

- Enter the five data points (1960, 12.4), (1970, 21.8), (1980, 20.4), (1990, 19.3), and (2000, 24.0) into your calculator. Then select cubic regression, as shown in Figure 4.52. The equation for $f(x)$ is shown in Figure 4.53.
- A graph of f and a scatterplot of the data are shown in Figure 4.54.
- $f(1974) \approx 21.9$ and $f(2007) \approx 36.3$; the 1974 estimate is reasonably close to 21.2, whereas the 2007 estimate is not close to 23.0.
- The 1974 estimate uses interpolation, and the 2007 estimate uses extrapolation. Because the end behavior of a higher degree polynomial rapidly tends to either ∞ or $-\infty$, extrapolation-based estimates are usually inaccurate.

Calculator Help

To find an equation of least-squares fit, see Appendix A (page AP-11). To copy a regression equation into Y_1 , see Appendix A (page AP-13.)

4.2 Putting It All Together

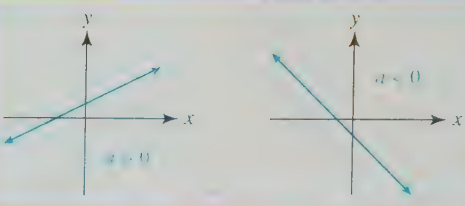

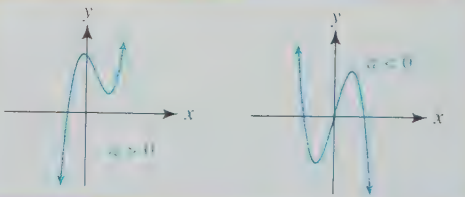

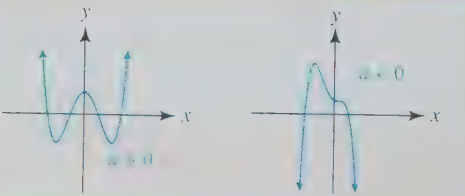

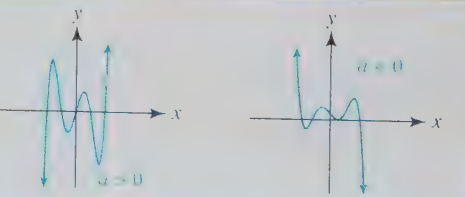

Higher degree polynomials generally have more complicated graphs. Each additional degree allows the graph to have possibly one more turning point and one more x -intercept. The graph of a polynomial function is continuous and smooth; it has no breaks or sharp edges. Its domain includes all real numbers. The end behavior of a polynomial always tends to either ∞ or $-\infty$. End behavior describes what happens to the y -values as $|x|$ becomes large.

A piecewise-defined function occurs when a function is defined by using two or more formulas for different intervals of the domain. If each formula is a polynomial, the function is called a piecewise-polynomial function.

The following summary shows important concepts regarding polynomial functions.

Function Type	Characteristics	Example Graphs
Constant (degree 0)	No x -intercepts and no turning points $f(x) = a, a \neq 0$	

continued from previous page

Function Type	Characteristics	Example Graphs
Linear (degree 1)	One x -intercept and no turning points $f(x) = ax + b, a \neq 0$	
Quadratic (degree 2)	At most two x -intercepts and exactly one turning point $f(x) = ax^2 + bx + c, a \neq 0$	
Cubic (degree 3)	At most three x -intercepts and up to two turning points $f(x) = ax^3 + bx^2 + cx + d, a \neq 0$	
Quartic (degree 4)	At most four x -intercepts and up to three turning points $f(x) = ax^4 + bx^3 + cx^2 + dx + e, a \neq 0$	
Quintic (degree 5)	At most five x -intercepts and up to four turning points $f(x) = ax^5 + bx^4 + cx^3 + dx^2 + ex + k, a \neq 0$	

4.2 Exercises

Note: Many of the answers in this section involve estimations. Your answers may vary slightly, particularly when you are reading a graph.

Graphs of Polynomial Functions

1. A runner is working out on a straight track. The graph at the top of the next page shows the runner's distance y in hundreds of feet from the starting line after t minutes.

- (a) Estimate the turning points.
- (b) Interpret each turning point.

2. A stone is thrown into the air. Its height y in feet after t seconds is shown in the graph. Use the graph to complete the following.
- Estimate the turning point.
 - Interpret this point.

Exercises 3–12: Use the graph of the polynomial function f to complete the following. Let a be the leading coefficient of the polynomial $f(x)$.

- Determine the number of turning points and estimate any x -intercepts.
- State whether $a > 0$ or $a < 0$.
- Determine the minimum degree of f .

Exercises 13–18: Complete the following without a calculator.

- Match the equation with its graph (a–f).
- Identify the turning points.
- Estimate the x -intercepts.
- Estimate any local extrema.
- Estimate any absolute extrema.

13. $f(x) = 1 - 2x + x^2$

14. $f(x) = 3x - x^3$

15. $f(x) = x^3 + 3x^2 - 9x$

16. $f(x) = x^4 - 8x^2$

17. $f(x) = 8x^2 - x^4$

18. $f(x) = x^5 + \frac{5}{2}x^4 - \frac{5}{3}x^3 - 5x^2$

Exercises 19–26: Complete the following.

- (a) Graph $y = f(x)$ in the standard viewing rectangle.
 (b) Approximate the coordinates of each turning point.
 (c) Estimate any local extrema.

19. $f(x) = \frac{1}{9}x^3 - 3x$

20. $f(x) = x^2 - 4x - 3$

21. $f(x) = 0.025x^4 - 0.45x^2 - 5$

22. $f(x) = -\frac{1}{8}x^4 + \frac{1}{3}x^3 + \frac{5}{4}x^2 - 3x + 3$

23. $f(x) = 1 - 2x + 3x^2$

24. $f(x) = 4x - \frac{1}{3}x^3$

25. $f(x) = \frac{1}{3}x^3 + \frac{1}{2}x^2 - 2x$

26. $f(x) = \frac{1}{4}x^4 + \frac{2}{3}x^3 - \frac{1}{2}x^2 - 2x + 1$

Exercises 27–38: Complete the following.

(a) State the degree and leading coefficient of f .

(b) State the end behavior of the graph of f .

27. $f(x) = -2x + 3$

28. $f(x) = \frac{2}{3}x - 2$

29. $f(x) = x^2 + 4x$

30. $f(x) = 5 - \frac{1}{2}x^2$

31. $f(x) = -2x^3$

32. $f(x) = 4x - \frac{1}{3}x^3$

33. $f(x) = x^2 - x^3 - 4$

34. $f(x) = x^4 - 4x^3 + 3x^2 - 3$

35. $f(x) = 0.1x^5 - 2x^2 - 3x + 4$

36. $f(x) = 3x^3 - 2 - x^4$

37. $f(x) = 4 + 2x - \frac{1}{2}x^2$

38. $f(x) = -0.2x^5 + 4x^2 - 3$

Modeling Data with Polynomials

Exercises 39–44: The data are modeled exactly by a linear, quadratic, cubic, or quartic function f with leading coefficient a . All zeros of f are real numbers located in the interval $[-3, 3]$.

(a) Make a line graph of the data.

(b) State the minimum degree of f .

(c) Is $a > 0$ or is $a < 0$?

(d) Find a formula for $f(x)$.

39.	x	-3	-2	-1	0	1	2	3
	$f(x)$	3	-8	-7	0	7	8	-3

40.	x	-3	-2	-1	0	1	2	3
	$f(x)$	11	9	7	5	3	1	-1

41.	x	-3	-2	-1	0	1	2	3
	$f(x)$	14	7	2	-1	-2	-1	2

42.	x	-3	-2	-1	0	1	2	3
	$f(x)$	-13	-6	-1	2	3	2	-1

43.	x	-3	-2	-1	0	1	2	3
	$f(x)$	-55	-5	1	-1	1	-5	-55

44.	x	-3	-2	-1	0	1	2	3
	$f(x)$	-15	0	3	0	-3	0	15

Sketching Graphs of Polynomials

Exercises 45–56: If possible, sketch a graph of a polynomial that satisfies the conditions. Let a be the leading coefficient.

45. Degree 3 with three real zeros and $a > 0$
46. Degree 4 with four real zeros and $a < 0$
47. Linear with $a < 0$
48. Cubic with one real zero and $a > 0$
49. Degree 4 and an even function with four turning points
50. Degree 5 and symmetric with respect to the y -axis
51. Degree 3 and an odd function with no x -intercepts
52. Degree 6 and an odd function with five turning points
53. Degree 3 with turning points $(-1, 2)$ and $(1, \frac{2}{3})$
54. Degree 4 with turning points $(-1, -1)$, $(0, 0)$, and $(1, -1)$
55. Degree 2 with turning point $(-1, 2)$, passing through $(-3, 4)$ and $(1, 4)$
56. Degree 5 and an odd function with five x -intercepts and a negative leading coefficient.

Dominant Term of a Polynomial

 Exercises 57 and 58: Graph the functions f , g , and h in the same viewing rectangle. What happens to their graphs as the size of the viewing rectangle increases? Explain why the term of highest degree in a polynomial is sometimes called the dominant term.

57. $f(x) = 2x^4$, $g(x) = 2x^4 - 5x^2 + 1$, and $h(x) = 2x^4 + 3x^2 - x - 2$

(a) $[-4, 4, 1]$ by $[-4, 4, 1]$

(b) $[-10, 10, 1]$ by $[-100, 100, 10]$

(c) $[-100, 100, 10]$ by $[-10^6, 10^6, 10^5]$

58. $f(x) = -x^3$, $g(x) = -x^3 + x^2 + 2$, and $h(x) = -x^3 - 2x^2 + x - 1$

(a) $[-4, 4, 1]$ by $[-4, 4, 1]$

(b) $[-10, 10, 1]$ by $[-100, 100, 10]$

(c) $[-100, 100, 10]$ by $[-10^5, 10^5, 10^4]$

Average Rates of Change

59. Compare the average rates of change from 0 to $\frac{1}{2}$ for $f(x) = x$, $g(x) = x^2$, and $h(x) = x^3$.

60. Compare the average rates of change from 1 to $\frac{3}{2}$ for $f(x) = x$, $g(x) = x^2$, and $h(x) = x^3$.

Exercises 61–64: Calculate the average rate of change of f on each interval. What happens to this average rate of change as the interval decreases in length?

(a) $[1.9, 2.1]$ (b) $[1.99, 2.01]$ (c) $[1.999, 2.001]$

61. $f(x) = x^3$

62. $f(x) = 4x - \frac{1}{3}x^3$

63. $f(x) = \frac{1}{4}x^4 - \frac{1}{3}x^3$

64. $f(x) = 4x^2 - \frac{1}{2}x^4$

Exercises 65–68: Find the difference quotient of g .

65. $g(x) = 3x^3$

66. $g(x) = -2x^3$

67. $g(x) = 1 + x - x^3$

68. $g(x) = \frac{1}{2}x^3 - 2x$

Piecewise-Defined Functions

Exercises 69–76: Evaluate $f(x)$ at the given values of x .

69. $x = -2$ and 1

70. $x = -1, 0$, and 3

71. $x = -1, 1$, and 2

72. $x = -2, 0$, and 2

73. $x = -3, 1$, and 4

$$f(x) = \begin{cases} x^3 - 4x^2 & \text{if } x \leq -3 \\ 3x^2 & \text{if } -3 < x < 4 \\ x^3 - 54 & \text{if } x \geq 4 \end{cases}$$

74. $x = -4, 0$, and 4

$$f(x) = \begin{cases} -4x & \text{if } x \leq -4 \\ x^3 + 2 & \text{if } -4 < x \leq 2 \\ 4 - x^2 & \text{if } x > 2 \end{cases}$$

75. $x = -2, 1$, and 2

$$f(x) = \begin{cases} x^2 + 2x + 6 & \text{if } -5 \leq x < 0 \\ x + 6 & \text{if } 0 \leq x < 2 \\ x^3 + 1 & \text{if } 2 \leq x \leq 5 \end{cases}$$

76. $x = 1975, 1980$, and 1998

$$f(x) = \begin{cases} 0.2(x - 1970)^3 + 60 & \text{if } 1970 \leq x < 1980 \\ 190 - (x - 1980)^2 & \text{if } 1980 \leq x < 1990 \\ 2(x - 1990) + 100 & \text{if } 1990 \leq x \leq 2000 \end{cases}$$

Exercises 77–82: Complete the following.

(a) Sketch a graph of f .(b) Determine if f is continuous on its domain.(c) Solve $f(x) = 0$.

$$77. f(x) = \begin{cases} 4 - x^2 & \text{if } -3 \leq x \leq 0 \\ x^2 - 4 & \text{if } 0 < x \leq 3 \end{cases}$$

$$78. f(x) = \begin{cases} x^2 & \text{if } -2 \leq x < 0 \\ x + 1 & \text{if } 0 \leq x \leq 2 \end{cases}$$

$$79. f(x) = \begin{cases} 2x & \text{if } -5 \leq x < -1 \\ -2 & \text{if } -1 \leq x < 0 \\ x^2 - 2 & \text{if } 0 \leq x \leq 2 \end{cases}$$

$$80. f(x) = \begin{cases} 0.5x^2 & \text{if } -4 \leq x \leq -2 \\ x & \text{if } -2 < x < 2 \\ x^2 - 4 & \text{if } 2 \leq x \leq 4 \end{cases}$$

$$81. f(x) = \begin{cases} x^3 + 3 & \text{if } -2 \leq x \leq 0 \\ x + 3 & \text{if } 0 < x < 1 \\ 4 + x - x^2 & \text{if } 1 \leq x \leq 3 \end{cases}$$

$$82. f(x) = \begin{cases} -2x & \text{if } -3 \leq x < -1 \\ x^2 + 1 & \text{if } -1 \leq x \leq 2 \\ \frac{1}{2}x^3 + 1 & \text{if } 2 < x \leq 3 \end{cases}$$

Applications

83. **Electronics** The Heaviside function H , used in the study of electrical circuits, is defined by

$$H(t) = \begin{cases} 0 & \text{if } t < 0 \\ 1 & \text{if } t \geq 0 \end{cases}$$

(a) Evaluate $H(-2)$, $H(0)$, and $H(3.5)$.(b) Graph $y = H(t)$.84. **A Strange Graph** The following definition is discussed in advanced mathematics courses.

$$f(x) = \begin{cases} 0 & \text{if } x \text{ is a rational number} \\ 1 & \text{if } x \text{ is an irrational number} \end{cases}$$

(a) Evaluate $f(-\frac{3}{4})$, $f(-\sqrt{2})$, and $f(\pi)$.(b) Is f a function? Explain.(c) Discuss the difficulty with graphing $y = f(x)$.85. **Modeling Temperature** In the figure the monthly average temperature in degrees Fahrenheit from January to December in Minneapolis is modeled by a polynomial function f , where $x = 1$ corresponds to January and $x = 12$ to December. (Source: A. Miller and J. Thompson, *Elements of Meteorology*.)

(a) Estimate the turning points.

(b) Interpret each turning point.

86. **Natural Gas Consumption** Refer to Figure 4.21 and Table 4.2 in the introduction to this section.(a) Solve the equation $f(x) = 20$ graphically. Interpret the solution set.

(b) Calculate the average rate of change in natural gas consumption from 1970 to 1980. Interpret the result.

87. **Endangered Species** The total number y of endangered and threatened species is given in the table at the top of the next column for various years x .

x	1980	1985	1990	1995	2000	2005
y	786	941	1181	1599	1741	1827

Source: Fish and Wildlife Services.

- Use regression to find a polynomial function f that models the data.
- Use f to estimate the number of endangered and threatened species in 1998. Did your answer involve interpolation or extrapolation?
- Estimate the year when this number reached 1600.

88. **Marijuana Use** The table lists the percentage y of high school seniors who had used marijuana within the previous month in the United States for various years x . In this table $x = 0$ corresponds to 1975 and $x = 20$ to 1995.

x (yr)	0	3	5	10	15	20
y (%)	27	37	33	25	14	21

Source: Health and Human Services Department.

- Use least-squares regression to find a polynomial function f that models the data.
- Use f to estimate marijuana use in 1997. Compare your answer to the actual value of 23%.
- Did your estimate in part (b) involve interpolation or extrapolation?

89. **Aging in America** The table lists the number N (in thousands) of Americans over 100 years old for selected years x .

x	1960	1970	1980	1990	2000
N	3	5	15	37	75

- Use regression to find a polynomial of degree 3 that models the data.
- Graph f and the data.
- Estimate N in 1994 and in 2010. Compare these answers to the actual values of 50 thousand and 129 thousand, respectively.
- Did your estimates in part (c) involve interpolation or extrapolation?

90. **Modeling** An object is lifted rapidly into the air at a constant speed and then dropped. Its height h in feet after x seconds is listed in the table.

x (sec)	0	1	2	3	4	5	6	7
h (ft)	0	36	72	108	144	128	80	0

- Make a line graph of the data. At what time does it appear that the object was dropped?
- Identify the time interval when the height could be modeled by a linear function. When could it be modeled by a nonlinear function?
- Determine values for the constants m , a , and b so that f models the data.

$$f(x) = \begin{cases} mx & \text{if } 0 \leq x \leq 4 \\ a(x - 4)^2 + b & \text{if } 4 < x \leq 7 \end{cases}$$

- Solve $f(x) = 100$ and interpret your answer.

91. **Modeling Water Flow** A cylindrical container has a height of 16 centimeters. Water entered the container at a constant rate until it was completely filled. Then water was allowed to leak out through a small hole in the bottom. The height of the water in the container was recorded every half minute over a 5-minute period.

Time (min)	0	0.5	1.0	1.5	2.0	2.5
Height (cm)	0	4	8	12	16	11.6

Time (min)	3.0	3.5	4.0	4.5	5.0
Height (cm)	8.1	5.3	3.1	1.4	0.5

- Plot the data.
- Find a piecewise-defined function that models the data. (Hint: Use regression.)
- Approximate the water level after 1.25 minutes and after 3.2 minutes.
- Estimate the time when water was flowing out of the tank and the water level was 5 centimeters.

92. **Modeling** A water tank is filled with a hose and then drained. The table shows the number of gallons y in the tank after t minutes.

t (min)	0	1	2	3	4	5	6	7
y (gal)	0	9	18	27	36	16	4	0

The following function f models the data in the table.

$$f(t) = \begin{cases} 9t & \text{if } 0 \leq t \leq 4 \\ 4t^2 - 56t + 196 & \text{if } 4 < t \leq 7 \end{cases}$$

Solve the equation $f(t) = 12$ and interpret the results.

Writing about Mathematics

Exercises 93–96: Discuss possible local or absolute extrema on the graph of f . Assume that $a > 0$.

93. $f(x) = ax + b$ 94. $f(x) = ax^2 + bx + c$

95. $f(x) = ax^3 + bx^2 + cx + d$

96. $f(x) = a|x|$

EXTENDED AND DISCOVERY EXERCISES

1. **Torricelli's Law** A cylindrical tank contains 500 gallons of water. A plug is pulled from the bottom of the tank, and it takes 10 minutes to drain the tank. The amount A of water in gallons remaining in the tank after t minutes is approximated by

$$A(t) = 500 \left(1 - \frac{t}{10} \right)^2.$$

- What is a reasonable domain for A ?
- Evaluate $A(1)$ and interpret the result.
- What are the degree and leading coefficient of $A(t)$?
- Has half the water drained from the tank after 5 minutes? Does this agree with your intuition? Explain.

Exercises 2–7: **Concavity** Estimate the intervals where the graph of f is concave up and where the graph is concave downward. Use interval notation.

2.

3.

4.

5.

6.

7.

CHECKING BASIC CONCEPTS FOR SECTIONS 4.1 AND 4.2

1. Use the graph of f to complete the following.

- Determine where f is increasing or decreasing.
- Identify any local extrema.
- Identify any absolute extrema.
- Approximate the x -intercepts and zeros of f . Then solve $f(x) = 0$. How are the x -intercepts, zeros, and solutions to $f(x) = 0$ related?

2. Use the graph to complete the following.

- Evaluate $f(-4)$, $f(0)$, and $f(4)$.
 - What type of symmetry does the graph of f exhibit?
 - Is f an odd function or an even function? Why?
 - Find the domain and range of f .
3. If possible, sketch a graph of a cubic polynomial with a negative leading coefficient that satisfies each of the following conditions.

- Zero x -intercepts
- One x -intercept
- Two x -intercepts
- Four x -intercepts

4. Plot the data in the table.

x	-3.2	-2	0	2	3.2
y	-11	15	-10	15	-11

- What is the minimum degree of the polynomial function f that would be needed to model these data? Explain.
- Should function f be odd, even, or neither? Explain.
- Should the leading coefficient of f be positive or negative? Explain.

5. Use least-squares regression to find a polynomial that models the data in Exercise 4.

4.3 Division of Polynomials

- Divide polynomials by monomials
- Divide polynomials by polynomials
- Apply the division algorithm
- Learn synthetic division
- Understand the remainder theorem

Introduction

The area A of a rectangle with length L and width W is calculated by $A = LW$. If we are given the area and the width of a rectangle, we can find the length L by solving $A = LW$ for L to obtain $L = \frac{A}{W}$. For example, if the area is 48 square feet and the width is 6 feet, then the length of the rectangle equals $L = \frac{48}{6} = 8$ feet. Now consider the more general situation shown in Figure 4.55.

Figure 4.55

The area A is $x^2 + 8x + 15$ and the width W is $x + 3$, so we can find an expression for L in the same way by calculating

$$L = \frac{A}{W} = \frac{x^2 + 8x + 15}{x + 3}.$$

In this case, the calculation of L involves division of polynomials. (See Example 5.) This section discusses basic concepts related to division of polynomials.

Division by Monomials

Adding (or subtracting) fractions having like denominators is straightforward. For example, $\frac{3}{17} + \frac{7}{17} = \frac{3+7}{17}$, and so $\frac{3+7}{17} = \frac{3}{17} + \frac{7}{17}$. Note that when we reverse the process, the denominator of 17 is divided into each term in the numerator. (Terms are separated by addition or subtraction signs.) By reversing the process, we can sometimes simplify expressions.

$$\frac{3x^4 + 5x^3}{5x^3} = \frac{3x^4}{5x^3} + \frac{5x^3}{5x^3} = \frac{3}{5}x + 1 \quad \text{Subtract exponents: } \frac{3x^4}{5x^3} = \frac{3}{5}x.$$

This process is used in the next example.

EXAMPLE 1 Dividing by a monomial

Divide $6x^3 - 3x^2 + 2$ by $2x^2$.

SOLUTION

Getting Started Remember to divide $2x^2$ into *every* term of $6x^3 - 3x^2 + 2$. ▶

Write the problem as $\frac{6x^3 - 3x^2 + 2}{2x^2}$. Then divide $2x^2$ into *every* term in the numerator.

$$\begin{aligned} \frac{6x^3 - 3x^2 + 2}{2x^2} &= \frac{6x^3}{2x^2} - \frac{3x^2}{2x^2} + \frac{2}{2x^2} \\ &= 3x - \frac{3}{2} + \frac{1}{x^2} \end{aligned}$$

Now Try Exercise 3 ◀

Algebra Review

To review simplification of rational expressions, see Chapter R (page R-30).

Division by Polynomials

Before dividing a polynomial by a binomial, we review division of natural numbers.

$$\begin{array}{r} \text{quotient} \rightarrow 58 \\ \text{divisor} \rightarrow 3 \overline{)175} \leftarrow \text{dividend} \\ \underline{15} \\ 25 \\ \underline{24} \\ 1 \leftarrow \text{remainder} \end{array}$$

This result is checked as follows: $3 \cdot 58 + 1 = 175$. That is,

$$(\text{Divisor}) (\text{Quotient}) + (\text{Remainder}) = (\text{Dividend}).$$

The quotient and remainder can also be expressed as $58\frac{1}{3}$. Since 3 does not divide into 175 evenly, 3 is *not* a factor of 175. When the remainder is 0, the divisor is a *factor* of the dividend. Division of polynomials is similar to division of natural numbers.

EXAMPLE 2 Dividing polynomials

Divide $2x^3 - 3x^2 - 11x + 7$ by $x - 3$. Check the result.

SOLUTION Begin by dividing x into $2x^3$.

$$\begin{array}{r} 2x^2 \\ x - 3 \overline{) 2x^3 - 3x^2 - 11x + 7} \\ \underline{2x^3 - 6x^2} \\ 3x^2 - 11x \end{array}$$

$\frac{2x^3}{x} = 2x^2$
 $2x^2(x - 3) = 2x^3 - 6x^2$
 Subtract. Bring down $-11x$.

In the next step, divide x into $3x^2$.

$$\begin{array}{r} 2x^2 + 3x \\ x - 3 \overline{) 2x^3 - 3x^2 - 11x + 7} \\ \underline{2x^3 - 6x^2} \\ 3x^2 - 11x \\ \underline{3x^2 - 9x} \\ -2x + 7 \end{array}$$

$\frac{3x^2}{x} = 3x$
 $3x(x - 3) = 3x^2 - 9x$
 Subtract. Bring down 7.

Now divide x into $-2x$.

$$\begin{array}{r} 2x^2 + 3x - 2 \\ x - 3 \overline{) 2x^3 - 3x^2 - 11x + 7} \\ \underline{2x^3 - 6x^2} \\ 3x^2 - 11x \\ \underline{3x^2 - 9x} \\ -2x + 7 \\ \underline{-2x + 6} \\ 1 \end{array}$$

$\frac{-2x}{x} = -2$
 $-2(x - 3) = -2x + 6$
 Subtract. Remainder is 1.

The quotient is $2x^2 + 3x - 2$ and the remainder is 1. Polynomial division is also checked by multiplying the divisor and quotient and then adding the remainder.

$$\begin{aligned} (x - 3)(2x^2 + 3x - 2) + 1 &= x(2x^2 + 3x - 2) - 3(2x^2 + 3x - 2) + 1 \\ &= 2x^3 + 3x^2 - 2x - 6x^2 - 9x + 6 + 1 \\ &= 2x^3 - 3x^2 - 11x + 7 \end{aligned}$$

Now Try Exercise 9 ◀

Algebra Review

To review multiplication of polynomials, see Chapter R (page R-16).

A division problem, such as $\frac{175}{3}$, is typically given in the form $\frac{(\text{Dividend})}{(\text{Divisor})}$. If we divide each term in the equation

$$(\text{Dividend}) = (\text{Divisor})(\text{Quotient}) + (\text{Remainder})$$

by (Divisor), we obtain the equation

$$\frac{(\text{Dividend})}{(\text{Divisor})} = (\text{Quotient}) + \frac{(\text{Remainder})}{(\text{Divisor})}$$

For example, because 175 divided by 3 equals 58 remainder 1, we can use this equation to justify writing $\frac{175}{3} = 58 + \frac{1}{3}$, or $58\frac{1}{3}$. We can use the results from Example 2 to write

$$\frac{2x^3 - 3x^2 - 11x + 7}{x - 3} = 2x^2 + 3x - 2 + \frac{1}{x - 3}.$$

This process is applied in the next example.

EXAMPLE 3 Dividing polynomials

Divide each expression. Check your answer.

(a) $\frac{6x^2 + 5x - 10}{2x + 3}$ (b) $(5x^3 - 4x^2 + 7x - 2) \div (x^2 + 1)$

SOLUTION(a) Begin by dividing $2x$ into $6x^2$.

$$\begin{array}{r} 3x \\ 2x + 3 \overline{) 6x^2 + 5x - 10} \\ \underline{6x^2 + 9x} \\ -4x - 10 \end{array}$$

$\frac{6x^2}{2x} = 3x$
 $3x(2x + 3) = 6x^2 + 9x$
 Subtract: $5x - 9x = -4x$.
 Bring down the -10 .

In the next step, divide $2x$ into $-4x$.

$$\begin{array}{r} 3x - 2 \\ 2x + 3 \overline{) 6x^2 + 5x - 10} \\ \underline{6x^2 + 9x} \\ -4x - 10 \\ \underline{-4x - 6} \\ -4 \end{array}$$

$\frac{-4x}{2x} = -2$
 $-2(2x + 3) = -4x - 6$
 Subtract: $-10 - (-6) = -4$.

The quotient is $3x - 2$ with remainder -4 . This result can also be written as follows.

$$3x - 2 + \frac{-4}{2x + 3} \quad (\text{Quotient}) + \frac{(\text{Remainder})}{(\text{Divisor})}$$

To check this result use the equation

$$(\text{Divisor})(\text{Quotient}) + (\text{Remainder}) = (\text{Dividend}).$$

This result can be checked as follows.

$$\begin{aligned} (2x + 3)(3x - 2) + (-4) &= 6x^2 + 5x - 6 - 4 \\ &= 6x^2 + 5x - 10 \end{aligned}$$

The result checks.

(b) Begin by writing $x^2 + 1$ as $x^2 + 0x + 1$.

$$\begin{array}{r} 5x - 4 \\ x^2 + 0x + 1 \overline{) 5x^3 - 4x^2 + 7x - 2} \\ \underline{5x^3 + 0x^2 + 5x} \\ -4x^2 + 2x - 2 \\ \underline{-4x^2 + 0x - 4} \\ 2x + 2 \end{array}$$

The quotient is $5x - 4$ with remainder of $2x + 2$. This result can also be written as

$$5x - 4 + \frac{2x + 2}{x^2 + 1}$$

This result can be checked as follows.

$$\begin{aligned} (x^2 + 1)(5x - 4) + 2x + 2 &= 5x^3 - 4x^2 + 5x - 4 + 2x + 2 \\ &= 5x^3 - 4x^2 + 7x - 2 \end{aligned}$$

The result checks

This process is summarized by the following *division algorithm for polynomials*.

Division Algorithm for Polynomials

Let $f(x)$ and $d(x)$ be two polynomials, with the degree of $d(x)$ greater than zero and less than the degree of $f(x)$. Then there exist unique polynomials $q(x)$ and $r(x)$ such that

$$f(x) = d(x) \cdot q(x) + r(x),$$

$$(\text{Dividend}) = (\text{Divisor}) \cdot (\text{Quotient}) + (\text{Remainder})$$

where either $r(x) = 0$ or the degree of $r(x)$ is less than the degree of $d(x)$. The polynomial $r(x)$ is called the remainder.

Synthetic Division

A shortcut called **synthetic division** can be used to divide $x - k$ into a polynomial. For example, to divide $x - 2$ into $3x^4 - 7x^3 - 4x + 5$, we perform the following steps. The equivalent steps involving long division are shown to the right.

$\begin{array}{r rrrrr} 2 & 3 & -7 & 0 & -4 & 5 \\ & & 6 & -2 & -4 & -16 \\ \hline & 3 & -1 & -2 & -8 & -11 \end{array}$	$\begin{array}{r} 3x^3 - x^2 - 2x - 8 \\ x - 2 \overline{) 3x^4 - 7x^3 + 0x^2 - 4x + 5} \\ \underline{3x^4 - 6x^3} \\ -1x^3 + 0x^2 \\ \underline{-1x^3 + 2x^2} \\ -2x^2 - 4x \\ \underline{-2x^2 + 4x} \\ -8x + 5 \\ \underline{-8x + 16} \\ -11 \end{array}$
--------------------------------------------------------------------------------------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Notice how the red and blue numbers in the expression for long division correspond to the third row in synthetic division. The remainder is -11 , which is the last number in the third row. The degree of the quotient, $3x^3 - x^2 - 2x - 8$, is one less than the degree of $f(x)$. The quotient's coefficients are $3, -1, -2$, and -8 and are found in the third row. The steps to divide a polynomial $f(x)$ by $x - k$ using synthetic division can be summarized as follows.

1. Write k to the left and the coefficients of $f(x)$ to the right in the top row. If any power of x does *not* appear in $f(x)$, include a 0 for that term. In this example, an x^2 -term did not appear, so a 0 is included in the first row.
2. Copy the leading coefficient of $f(x)$ into the third row and multiply it by k . Write the result below the next coefficient of $f(x)$ in the second row. Add the numbers in the second column and place the result in the third row. Repeat the process. In this example, the leading coefficient is 3 and $k = 2$. Since $3 \cdot 2 = 6$, 6 is placed below -7 . Then add to obtain $-7 + 6 = -1$. Multiply -1 by 2 and repeat.
3. The last number in the third row is the remainder. If the remainder is 0, then the binomial $x - k$ is a factor of $f(x)$. The other numbers in the third row are the coefficients of the quotient, with terms written in descending powers.

EXAMPLE 4 Performing synthetic division

Use synthetic division to divide $2x^3 + 4x^2 - x + 5$ by $x + 2$.

SOLUTION

Getting Started To find the value of k , write the divisor as $x - k$. Because $x + 2$ equals $x - (-2)$, the value of k is -2 . ▶

Let $k = -2$ and perform synthetic division on the problem $\frac{2x^3 + 4x^2 - x + 5}{x + 2}$.

$$\begin{array}{r|rrrr} -2 & 2 & 4 & -1 & 5 \\ & & -4 & 0 & 2 \\ \hline & 2 & 0 & -1 & 7 \end{array}$$

The remainder is 7 and the quotient is $2x^2 + 0x - 1 = 2x^2 - 1$. This result is expressed by the equation

$$\frac{2x^3 + 4x^2 - x + 5}{x + 2} = 2x^2 - 1 + \frac{7}{x + 2}.$$

Now Try Exercise 41 ◀

An Application from Geometry In the final example, we use division to solve the problem presented in the introduction to this section.

EXAMPLE 5 Finding the length of a rectangle

If the area of a rectangle is $x^2 + 8x + 15$ and its width is $x + 3$, use division to find its length.

SOLUTION We use synthetic division to divide $x^2 + 8x + 15$ by $x + 3$. However, long division could be used.

$$\begin{array}{r|rrr} -3 & 1 & 8 & 15 \\ & & -3 & -15 \\ \hline & 1 & 5 & 0 \end{array}$$

The remainder is 0, so $x + 3$ divides evenly into $x^2 + 8x + 15$, and the length is $x + 5$.

Now Try Exercise 51 ◀

Remainder Theorem If the divisor $d(x)$ is $x - k$, then the division algorithm for polynomials simplifies to

$$f(x) = (x - k)q(x) + r,$$

where r is a constant. If we let $x = k$ in this equation, then

$$f(k) = (k - k)q(k) + r = r.$$

Thus $f(k)$ is equal to the remainder obtained in synthetic division. In Example 4, when $f(x) = 2x^3 + 4x^2 - x + 5$ is divided by $x + 2$, the remainder is 7. It follows that $f(-2) = 2(-2)^3 + 4(-2)^2 - (-2) + 5 = 7$. This result is summarized by the *remainder theorem*.

Remainder Theorem

If a polynomial $f(x)$ is divided by $x - k$, the remainder is $f(k)$.

4.3 Putting It All Together

The following table lists some important concepts related to a polynomial $f(x)$.

Concept	Explanation	Example
Division by a monomial	Be sure to divide the denominator into <i>every term</i> in the numerator.	$\frac{5a^3 - 10a^2}{5a^2} = \frac{5a^3}{5a^2} - \frac{10a^2}{5a^2} = a - 2$
Division by a polynomial	Division by a polynomial can be done in a manner similar to long division of natural numbers. See Examples 2 and 3.	When $6x^3 + 5x^2 - 8x + 4$ is divided by $2x - 1$, the quotient is $3x^2 + 4x - 2$ with remainder 2 and can be written as $\frac{6x^3 + 5x^2 - 8x + 4}{2x - 1} = 3x^2 + 4x - 2 + \frac{2}{2x - 1}.$
Division algorithm	(Dividend) = (Divisor)(Quotient) + (Remainder) This equation can be written as $\frac{(\text{Dividend})}{(\text{Divisor})} = (\text{Quotient}) + \frac{(\text{Remainder})}{(\text{Divisor})}.$	$\frac{x^3 - 1}{x + 1} = x^2 - x + 1 + \frac{-2}{x + 1}$ Dividend: $x^3 - 1$ Divisor: $x + 1$ Quotient: $x^2 - x + 1$ Remainder: -2
Synthetic division	An efficient method for dividing $x - k$ into a polynomial	Divide $2x^3 - 3x^2 + x + 2$ by $x + 1$. $\begin{array}{r rrrr} -1 & 2 & -3 & 1 & 2 \\ & & -2 & 5 & -6 \\ \hline & 2 & -5 & 6 & -4 \end{array}$ The quotient is $2x^2 - 5x + 6$, and the remainder is -4 .
Remainder theorem	If a polynomial $f(x)$ is divided by $x - k$, the remainder is $f(k)$.	If $f(x) = 3x^2 - 2x + 6$ is divided by $x - 2$, the remainder is $f(2) = 3(2)^2 - 2(2) + 6 = 14$.

4.3 Exercises

Division by Monomials

Exercises 1–8: Divide the expression.

1. $\frac{5x^4 - 15}{10x}$

2. $\frac{x^2 - 5x}{5x}$

5. $\frac{x^3 - 4}{4x^3}$

6. $\frac{2x^4 - 3x^2 + 4x - 7}{-4x}$

3. $\frac{3x^4 - 2x^2 - 1}{3x^3}$

4. $\frac{5x^3 - 10x^2 + 5x}{15x^2}$

7. $\frac{5x(3x^2 - 6x + 1)}{3x^2}$

8. $\frac{(1 - 5x^2)(x + 1) + x^2}{2x}$

Division by Polynomials

Exercises 9–14: Divide the first polynomial by the second. State the quotient and remainder.

9. $x^3 - 2x^2 - 5x + 6$ $x - 3$

10. $3x^3 - 10x^2 - 27x + 10$ $x + 2$

11. $2x^4 - 7x^3 - 5x^2 - 19x + 17$ $x + 1$

12. $x^4 - x^3 - 4x + 1$ $x - 2$

13. $3x^3 - 7x + 10$ $x - 1$

14. $x^4 - 16x^2 + 1$ $x + 4$

Exercises 15–22: Divide. Check your answer.

15. $\frac{x^4 - 3x^3 - x + 3}{x - 3}$ 16. $\frac{x^3 - 2x^2 - x + 3}{x + 1}$

17. $\frac{4x^3 - x^2 - 5x + 6}{x - 1}$ 18. $\frac{x^4 + 3x^3 - 4x + 1}{x + 2}$

19. $\frac{x^3 + 1}{x + 1}$ 20. $\frac{x^5 + 3x^4 - x - 3}{x + 3}$

21. $\frac{6x^3 + 5x^2 - 8x + 4}{2x - 1}$ 22. $\frac{12x^3 - 14x^2 + 7x - 7}{3x - 2}$

Exercises 23–30: Divide the expression.

23. $\frac{3x^4 - 7x^3 + 6x - 16}{3x - 7}$

24. $\frac{20x^4 + 6x^3 - 2x^2 + 15x - 2}{5x - 1}$

25. $\frac{5x^4 - 2x^2 + 6}{x^2 + 2}$

26. $\frac{x^3 - x^2 + 2x - 3}{x^2 + 3}$

27. $\frac{8x^3 + 10x^2 - 12x - 15}{2x^2 - 3}$

28. $\frac{3x^4 - 2x^2 - 5}{3x^2 - 5}$

29. $\frac{2x^4 - x^3 + 4x^2 + 8x + 7}{2x^2 + 3x + 2}$

30. $\frac{3x^4 + 2x^3 - x^2 + 4x - 3}{x^2 + x - 1}$

Division Algorithm

Exercises 31 and 32: Use the equation

$$(\text{Dividend}) = (\text{Divisor})(\text{Quotient}) + (\text{Remainder})$$

to complete the following.

31. $\frac{x^3 - 8x^2 + 15x - 6}{x - 2} = x^2 - 6x + 3$ implies $(x - 2)(x^2 - 6x + 3) = \underline{\quad? \quad}$.

32. $\frac{x^4 - 15}{x + 2} = x^3 - 2x^2 + 4x - 8 + \frac{1}{x + 2}$ implies $x^4 - 15 = (x + 2) \times \underline{\quad? \quad} + \underline{\quad? \quad}$.

Exercises 33–38: Use division to express the (Dividend) as (Divisor)(Quotient) + (Remainder).

33. $\frac{x^2 - 3x + 1}{x - 2}$ 34. $\frac{2x^2 - x + 2}{x + 4}$

35. $\frac{2x^3 + x^2 - 2x}{2x + 1}$ 36. $\frac{1 - x^2 + x^3}{x - 1}$

37. $\frac{x^3 - x^2 + x + 1}{x^2 + 1}$ 38. $\frac{2x^3 + x^2 - x + 4}{x^2 + x}$

Synthetic Division

Exercises 39–46: Use synthetic division to divide the first polynomial by the second.

39. $x^3 + 2x^2 - 17x - 10$ $x + 5$

40. $x^3 - 2x + 1$ $x + 4$

41. $3x^3 - 11x^2 - 20x + 3$ $x - 5$

42. $x^4 - 3x^3 - 5x^2 + 2x - 16$ $x - 3$

43. $x^4 - 3x^3 - 4x^2 + 12x$ $x - 2$

44. $x^5 + \frac{1}{4}x^4 - x^3 - \frac{1}{4}x^2 + 3x - \frac{5}{4}$ $x + \frac{1}{4}$

45. $2x^5 - x^4 - x^3 + 4x + 3$ $x + \frac{1}{2}$

46. $x^4 - \frac{1}{2}x^3 + 3x^2 - \frac{5}{2}x + \frac{9}{2}$ $x - \frac{1}{2}$

Remainder Theorem

Exercises 47–50: Use the remainder theorem to find the remainder when $f(x)$ is divided by the given $x - k$.

47. $f(x) = 5x^2 - 3x + 1$ $x - 1$

48. $f(x) = -4x^2 + 6x - 7$ $x + 4$

49. $f(x) = 4x^3 - x^2 + 4x + 2$ $x + 2$

50. $f(x) = -x^4 + 4x^3 - x + 3$ $x - 3$

Applications

51. **Area of a Rectangle** Use the figure to find the length L of the rectangle from its width and area A . Determine L when $x = 10$ feet.

52. **Area of a Rectangle** Use the figure to find the width W of the rectangle from its length and area A . Determine W when $x = 5$ inches.

**Writing about Mathematics**

53. Compare division of integers to division of polynomials. Give examples.
54. When can you use synthetic division to divide two polynomials? Give one example where synthetic division can be used and one example where it cannot be used.

4.4 Real Zeros of Polynomial Functions

- Understand the factor theorem
- Factor higher degree polynomials
- Analyze polynomials having multiple zeros
- Solve higher degree polynomial equations
- Understand the rational zeros test, Descartes' rule of signs, and the intermediate value property (optional)

**Introduction**

Some species of birds, such as robins, have two nesting periods each summer. Because the survival rate for young birds is low, bird populations can fluctuate greatly during the summer months. (Source: S. Kress, *Bird Life*.)

The graph of $f(x) = x^3 - 61x^2 + 839x + 4221$ shown in Figure 4.56 models a population of birds in a small country, where $x = 1$ corresponds to June 1, $x = 2$ to June 2, $x = 3$ to June 3, and so on.

Figure 4.56 A Summer Bird Population

If we want to determine the dates when the population was 5000, we can solve

$$x^3 - 61x^2 + 839x + 4221 = 5000, \text{ or } x^3 - 61x^2 + 839x - 779 = 0.$$

From the graph of f it appears that there were 5000 birds around June 1 ($x = 1$), June 20 ($x = 20$), and July 10 ($x = 40$). In Example 5 we find an exact symbolic solution.

Factoring Polynomials

The polynomial $f(x) = x^2 - 3x + 2$ can be factored as $f(x) = (x - 1)(x - 2)$. Note that $f(1) = 0$ and $(x - 1)$ is a factor of $f(x)$. Similarly, $f(2) = 0$ and $(x - 2)$ is a factor.

This discussion can be generalized. By the remainder theorem we know that

$$f(x) = (x - k)q(x) + r,$$

where r is the remainder. If $r = 0$, then $f(x) = (x - k)q(x)$ and $(x - k)$ is a factor of $f(x)$. Similarly, if $(x - k)$ is a factor of $f(x)$, then $r = 0$. That is,

$$f(x) = (x - k)q(x)$$

and $f(k) = (k - k)q(k) = 0 \cdot q(k) = 0$. This discussion justifies the *factor theorem*.

Factor Theorem

A polynomial $f(x)$ has a factor $x - k$ if and only if $f(k) = 0$.

NOTE If $f(-2) = 0$, then $(x - (-2))$, or $(x + 2)$, is a factor.

EXAMPLE 1 Applying the factor theorem

Use the graph in Figure 4.57 and the factor theorem to list the factors of $f(x)$.

SOLUTION Figure 4.57 shows that the zeros (or x -intercepts) of f are -2 , 1 , and 3 . Since $f(-2) = 0$, the factor theorem states that $(x + 2)$ is a factor of $f(x)$. Similarly, $f(1) = 0$ implies that $(x - 1)$ is a factor, and $f(3) = 0$ implies that $(x - 3)$ is a factor. Thus the factors of $f(x)$ are $(x + 2)$, $(x - 1)$, and $(x - 3)$.

Now Try Exercise 1

Figure 4.57

Figure 4.58

MAKING CONNECTIONS

x -Intercepts, Zeros, and Factors Let $f(x)$ be a polynomial with degree 1 or more. The following statements are *equivalent*.

1. The graph of $y = f(x)$ has x -intercept k .
2. A real zero of $f(x)$ is k . That is, $f(k) = 0$.
3. A factor of $f(x)$ is $(x - k)$.

Zeros with Multiplicity The polynomial $f(x) = x^2 + 4x + 4$ can be written as $f(x) = (x + 2)^2$. Since the factor $(x + 2)$ occurs twice in $f(x)$, the zero -2 is called a **zero of multiplicity 2**. The polynomial $g(x) = (x + 1)^3(x - 2)$ has zeros -1 and 2 with **multiplicities 3 and 1**, respectively. A graph of g is shown in Figure 4.58, where the x -intercepts coincide with the zeros of g . *Counting multiplicities*, a polynomial of degree n has at most n real zeros. For $g(x)$, the sum of the multiplicities is $3 + 1 = 4$, which equals its degree.

Complete Factored Form The concepts discussed above, together with the factor theorem, can be used to find the *complete factored form* of a polynomial. The complete factored form of a polynomial is unique.

Complete Factored Form

Suppose a polynomial

$$f(x) = a_n x^n + \cdots + a_2 x^2 + a_1 x + a_0$$

has n real zeros $c_1, c_2, c_3, \dots, c_n$, where a distinct zero is listed as many times as its multiplicity. Then $f(x)$ can be written in **complete factored form** as

$$f(x) = a_n(x - c_1)(x - c_2)(x - c_3) \cdots (x - c_n).$$

EXAMPLE 2 Finding a complete factorization

Write the complete factorization for each polynomial with the given zeros.

(a) $f(x) = 13x^2 - \frac{91}{2}x + 39$; zeros: $\frac{3}{2}$ and 2

(b) $f(x) = 7x^3 - 21x^2 - 7x + 21$; zeros: $-1, 1$, and 3

SOLUTION

(a) The leading coefficient is 13 and the zeros are $\frac{3}{2}$ and 2. By the factor theorem, $(x - \frac{3}{2})$ and $(x - 2)$ are factors. The complete factorization is

$$f(x) = 13\left(x - \frac{3}{2}\right)(x - 2).$$

(b) The leading coefficient is 7 and the zeros are $-1, 1$, and 3. The complete factorization is

$$f(x) = 7(x + 1)(x - 1)(x - 3).$$

Now Try Exercises 5 and 7

MAKING CONNECTIONS

Types of Factored Forms If the leading coefficient of a polynomial $f(x)$ is 6 and the only zeros are $\frac{1}{3}$ and $\frac{1}{2}$, then the complete factored form is $f(x) = 6\left(x - \frac{1}{3}\right)\left(x - \frac{1}{2}\right)$ and it is *unique*. Sometimes we factor 6 as $3 \cdot 2$ and distribute the 3 over the first factor and the 2 over the second factor to obtain the slightly different factored form $f(x) = (3x - 1)(2x - 1)$.

EXAMPLE 3 Factoring a polynomial graphically

Use the graph of f in Figure 4.59 to factor $f(x) = 2x^3 - 4x^2 - 10x + 12$.

SOLUTION

Getting Started To factor $f(x)$ we need to determine the leading coefficient and the zeros of f . The zeros coincide with the x -intercepts of the graph of f .

The leading coefficient is 2, and the zeros are $-2, 1$, and 3. The complete factorization is

$$f(x) = 2(x + 2)(x - 1)(x - 3).$$

Now Try Exercise 13

Figure 4.59

When factoring polynomials by hand, it is sometimes helpful to use the techniques of division discussed in Section 4.3.

EXAMPLE 4 Factoring a polynomial symbolically

The polynomial $f(x) = 2x^3 - 2x^2 - 34x - 30$ has a zero of -1 . Express $f(x)$ in complete factored form.

SOLUTION If -1 is a zero, then by the factor theorem $(x + 1)$ is a factor. To factor $f(x)$, divide $x + 1$ into $2x^3 - 2x^2 - 34x - 30$ by using synthetic division.

$$\begin{array}{r|rrrr} -1 & 2 & -2 & -34 & -30 \\ & & -2 & 4 & 30 \\ \hline & 2 & -4 & -30 & 0 \end{array}$$

The remainder is 0 , so $x + 1$ divides evenly into the dividend. By the division algorithm,

$$2x^3 - 2x^2 - 34x - 30 = (x + 1)(2x^2 - 4x - 30).$$

The quotient $2x^2 - 4x - 30$ can be factored further.

$$\begin{aligned} 2x^2 - 4x - 30 &= 2(x^2 - 2x - 15) \\ &= 2(x + 3)(x - 5) \end{aligned}$$

The complete factored form is $f(x) = 2(x + 1)(x + 3)(x - 5)$. **Now Try Exercise 31** ◀

An Application In the next example, we factor $g(x) = x^3 - 61x^2 + 839x - 779$, which was presented earlier, and then use the complete factorization to determine the days when the bird population was 5000.

EXAMPLE 5 Factoring a polynomial

Factor $g(x) = x^3 - 61x^2 + 839x - 779$. Use the zeros of $g(x)$ to determine when the bird population was 5000.

SOLUTION From Figure 4.56, repeated in the margin, it appears that the bird population was 5000 when $x = 1$. If we substitute $x = 1$ in this polynomial, the result is 0 .

$$g(1) = 1^3 - 61(1)^2 + 839(1) - 779 = 0$$

By the factor theorem, $(x - 1)$ is a factor of $g(x)$. We can use synthetic division to divide $x^3 - 61x^2 + 839x - 779$ by $x - 1$.

$$\begin{array}{r|rrrr} 1 & 1 & -61 & 839 & -779 \\ & & 1 & -60 & 779 \\ \hline & 1 & -60 & 779 & 0 \end{array}$$

The remainder is 0 .

By the division algorithm,

$$x^3 - 61x^2 + 839x - 779 = (x - 1)(x^2 - 60x + 779).$$

Since it is not obvious how to factor $x^2 - 60x + 779$, we can use the quadratic formula to find its zeros.

$$\begin{aligned} x &= \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \\ &= \frac{-(-60) \pm \sqrt{(-60)^2 - 4(1)(779)}}{2(1)} \\ &= \frac{60 \pm 22}{2} \\ &= 41 \text{ or } 19 \end{aligned}$$

Algebra Review

To review factoring trinomials, see Chapter R (page R-23).

The zeros of $g(x) = x^3 - 61x^2 + 839x - 779$ are 1, 19, and 41, and its leading coefficient is 1. The complete factorization is $g(x) = (x - 1)(x - 19)(x - 41)$. The bird population equals 5000 on June 1 ($x = 1$), June 19 ($x = 19$), and July 11 ($x = 41$).

Now Try Exercise 113 ◀

Graphs and Multiple Zeros

The polynomial $f(x) = 0.02(x + 3)^3(x - 3)^2$ has zeros -3 and 3 with multiplicities **3** and **2**, respectively. At the zero of even multiplicity the graph does not cross the x -axis, whereas the graph does cross the x -axis at the zero of odd multiplicity. See Figure 4.60.

Figure 4.60

Figure 4.61

The graph of $g(x) = 0.03(x + 5)(x - 2)^3$ is shown in Figure 4.61. The zeros of g are -5 and 2 with multiplicities of 1 and 3, respectively. Since both zeros have odd multiplicity, the graph crosses the x -axis at -5 and 2 . Notice that the zero 2 has a higher multiplicity and the graph levels off more near $x = 2$ than it does near $x = -5$. The higher the multiplicity of a zero, the more the graph of a polynomial levels off near the zero.

Figure 4.62

EXAMPLE 4 Finding multiplicities graphically

Figure 4.62 shows the graph of a sixth-degree polynomial $f(x)$ with leading coefficient 1. All zeros are integers. Write $f(x)$ in complete factored form.

SOLUTION The x -intercepts or zeros of f are -2 , 0 , and 4 . Since the graph crosses the x -axis at -2 and 4 , these zeros have odd multiplicity. The graph of f levels off more at $x = 4$ than at $x = -2$, so 4 has a higher multiplicity than -2 . At $x = 0$ the graph of f does not cross the x -axis. Thus 0 has even multiplicity. If -2 has multiplicity 1, 0 has multiplicity 2, and 4 has multiplicity 3, then the sum of the multiplicities is given by $1 + 2 + 3 = 6$, which equals the degree of $f(x)$. List the zeros as -2 , 0 , 0 , 4 , 4 , and 4 . The leading coefficient is 1, so the complete factorization of $f(x)$ is

$$f(x) = 1(x + 2)(x - 0)(x - 0)(x - 4)(x - 4)(x - 4), \text{ or}$$

$$f(x) = x^2(x + 2)(x - 4)^3.$$

Now Try Exercise 47 ◀

An Application: “Will It Float?” Multiple zeros sometimes have physical significance. The next example shows how a multiple zero represents the boundary between an object’s floating and sinking.

EXAMPLE 7 Interpreting a multiple zero

The polynomial $f(x) = \frac{\pi}{3}x^3 - 5\pi x^2 + \frac{500\pi d}{3}$ can be used to find the depth that a ball, 10 centimeters in diameter, sinks in water. The constant d is the density of the ball, where the density of water is 1. The smallest *positive* zero of $f(x)$ equals the depth that the sphere sinks. Approximate this depth for each material and interpret the results.

- (a) A wood ball with $d = 0.8$
- (b) A solid aluminum sphere with $d = 2.7$
- (c) A water balloon with $d = 1$

SOLUTION

- (a) Let $d = 0.8$ and graph $Y_1 = (\pi/3)X^3 - 5\pi X^2 + 500\pi(0.8)/3$. In Figure 4.63 the smallest positive zero is near 7.13. This means that the 10-centimeter wood ball sinks about 7.13 centimeters into the water.
- (b) Let $d = 2.7$ and graph $Y_2 = (\pi/3)X^3 - 5\pi X^2 + 500\pi(2.7)/3$. In Figure 4.64 there is no positive zero. The aluminum sphere is more dense than water and sinks.
- (c) Let $d = 1$ and graph $Y_3 = (\pi/3)X^3 - 5\pi X^2 + 500\pi/3$. In Figure 4.65 y_3 has one positive zero of 10 with multiplicity 2. The water balloon has the same density as water and “floats” even with the surface. The value of $d = 1$ represents the boundary between sinking and floating. If the ball floats, $f(x)$ has two positive zeros; if it sinks, $f(x)$ has no positive zeros. With the water balloon there is one positive zero with multiplicity 2 that represents a transition between floating and sinking.

CLASS DISCUSSION

Make a conjecture about the depth that a ball with a 10-centimeter diameter will sink in water if $d = 0.5$. Test your conjecture graphically.

Now Try Exercise 111

MAKING CONNECTIONS

Zeros and Multiplicity If a zero of a polynomial $f(x)$ has odd multiplicity, then its graph crosses the x -axis at the zero. If a zero has even multiplicity, then its graph intersects, but does not cross, the x -axis at the zero. The higher the multiplicity of a zero, the more the graph levels off at the zero. These concepts are illustrated in the following figures.

Rational Zeros (Optional)

If a polynomial has a rational zero, it can be found by using the *rational zero test*.

Rational Zero Test

Let $f(x) = a_n x^n + \cdots + a_2 x^2 + a_1 x + a_0$, where $a_n \neq 0$, represent a polynomial function f with integer coefficients. If $\frac{p}{q}$ is a rational number written in lowest terms and if $\frac{p}{q}$ is a zero of f , then p is a factor of the constant term a_0 and q is a factor of the leading coefficient a_n .

The following example illustrates how to find rational zeros by using this test.

EXAMPLE 8 Finding rational zeros of a polynomial

Find all rational zeros of $f(x) = 6x^3 - 5x^2 - 7x + 4$ and factor $f(x)$.

SOLUTION If $\frac{p}{q}$ is a rational zero in lowest terms, then p is a factor of the constant term 4 and q is a factor of the leading coefficient 6. The possible values for p and q are as follows.

$$\begin{array}{l} p: \quad \pm 1, \quad \pm 2, \quad \pm 4 \\ q: \quad \pm 1, \quad \pm 2, \quad \pm 3, \quad \pm 6 \end{array}$$

As a result, any rational zero of $f(x)$ in the form $\frac{p}{q}$ must occur in the list

$$\pm \frac{1}{6}, \quad \pm \frac{1}{3}, \quad \pm \frac{1}{2}, \quad \pm \frac{2}{3}, \quad \pm \frac{1}{1}, \quad \pm \frac{4}{3}, \quad \pm \frac{2}{1}, \quad \text{or} \quad \pm \frac{4}{1}.$$

Evaluate $f(x)$ at each value in the list. See Table 4.3.

Table 4.3

x	$f(x)$	x	$f(x)$	x	$f(x)$	x	$f(x)$
$\frac{1}{6}$	$\frac{49}{18}$	$\frac{1}{2}$	0	1	-2	2	18
$-\frac{1}{6}$	5	$-\frac{1}{2}$	$\frac{11}{2}$	1	0	-2	-50
$\frac{1}{3}$	$\frac{4}{3}$	$\frac{2}{3}$	$-\frac{10}{9}$	$\frac{4}{3}$	0	4	280
$-\frac{1}{3}$	$\frac{50}{9}$	$-\frac{2}{3}$	$\frac{14}{3}$	$-\frac{4}{3}$	$-\frac{88}{9}$	-4	-432

From Table 4.3 there are three rational zeros: -1 , $\frac{1}{2}$, and $\frac{4}{3}$. Since a third-degree polynomial has at most three zeros, the complete factored form of $f(x)$ is

$$f(x) = 6(x + 1)\left(x - \frac{1}{2}\right)\left(x - \frac{4}{3}\right),$$

which can also be written as $f(x) = (x + 1)(2x - 1)(3x - 4)$. **Now Try Exercise 57** ◀

NOTE Although $f(x)$ in Example 8 had only rational zeros, it is important to realize that many polynomials have irrational zeros. Irrational zeros cannot be found using the rational zero test.

Descartes' Rule of Signs (Optional)

Descartes' rule of signs helps to determine the numbers of positive and negative real zeros of a polynomial function.

Descartes' Rule of Signs

Let $P(x)$ define a polynomial function with real coefficients and a nonzero constant term, with terms in descending powers of x .

- (a) The number of positive real zeros either equals the number of variations in sign occurring in the coefficients of $P(x)$ or is less than the number of variations by a positive even integer.
- (b) The number of negative real zeros either equals the number of variations in sign occurring in the coefficients of $P(-x)$ or is less than the number of variations by a positive even integer.

A *variation in sign* is a change from positive to negative or negative to positive in successive terms of the polynomial when written in descending powers of the variable. Missing terms (those with 0 coefficients) can be ignored.

EXAMPLE 3 Applying Descartes' rule of signs

Determine the possible numbers of positive real zeros and negative real zeros of $P(x) = x^4 - 6x^3 + 8x^2 + 2x - 1$.

SOLUTION We first consider the possible number of positive zeros by observing that $P(x)$ has three variations in sign.

$$\begin{array}{ccccccc} +x^4 & - & 6x^3 & + & 8x^2 & + & 2x - 1 \\ & \nearrow & \searrow & \nearrow & \searrow & \nearrow & \searrow \\ & 1 & & 2 & & & 3 \end{array}$$

Thus by Descartes' rule of signs, $P(x)$ has either 3 or $3 - 2 = 1$ positive real zeros.

For negative zeros, consider the variations in sign for $P(-x)$.

$$\begin{aligned} P(-x) &= (-x)^4 - 6(-x)^3 + 8(-x)^2 + 2(-x) - 1 \\ &= x^4 + 6x^3 + 8x^2 - 2x - 1 \end{aligned}$$

Since there is only one variation in sign, $P(x)$ has only one negative real zero.

Now Try Exercise 65 ◀

Polynomial Equations

In Section 3.2, factoring was used to solve quadratic equations. Factoring also can be used to solve polynomial equations with degree greater than 2.

EXAMPLE 10 Solving a cubic equation

Solve $x^3 + 3x^2 - 4x = 0$ symbolically. Support your answer graphically and numerically.

[-5, 5, 1] by [-15, 15, 5]

Figure 4.66

X	Y1
-4	0
-3	12
-2	12
-1	6
0	0
1	0
2	12

$Y1 = X^3 + 3X^2 - 4X$

Figure 4.67

SOLUTION**Symbolic Solution**

$$x^3 + 3x^2 - 4x = 0 \quad \text{Given equation}$$

$$x(x^2 + 3x - 4) = 0 \quad \text{Factor out } x.$$

$$x(x + 4)(x - 1) = 0 \quad \text{Factor the quadratic expression.}$$

$$x = 0, \quad x + 4 = 0, \quad \text{or} \quad x - 1 = 0 \quad \text{Zero-product property}$$

$$x = 0, -4, \text{ or } 1 \quad \text{Solve.}$$

Graphical Solution Graph $Y_1 = X^3 + 3X^2 - 4X$ as in Figure 4.66. The x -intercepts are -4 , 0 , and 1 , which correspond to the solutions.

Numerical Solution Table $Y_1 = X^3 + 3X^2 - 4X$ as in Figure 4.67. The zeros of Y_1 occur at $x = -4$, 0 , and 1 .

Now Try Exercise 71 ◀

EXAMPLE 11 Solving a polynomial equation

Find all real solutions to each equation symbolically.

(a) $4x^4 - 5x^2 - 9 = 0$ (b) $2x^3 + 12 = 3x^2 + 8x$

SOLUTION

(a) The expression $4x^4 - 5x^2 - 9$ can be factored in a manner similar to the way quadratic expressions are factored.

$$4x^4 - 5x^2 - 9 = 0 \quad \text{Given equation}$$

$$(4x^2 - 9)(x^2 + 1) = 0 \quad \text{Factor.}$$

$$4x^2 - 9 = 0 \quad \text{or} \quad x^2 + 1 = 0 \quad \text{Zero-product property}$$

$$4x^2 = 9 \quad \text{or} \quad x^2 = -1 \quad \text{Add 9 or subtract 1.}$$

$$x^2 = \frac{9}{4} \quad \text{or} \quad x^2 = -1 \quad \text{Divide by 4.}$$

$$x = \pm \frac{3}{2} \quad \text{or} \quad x^2 = -1 \quad \text{Square root property}$$

The equation $x^2 = -1$ has no *real* solutions. The solutions are $-\frac{3}{2}$ and $\frac{3}{2}$.

(b) First transpose each term on the right side of the equation to the left side of the equation. Then use *grouping* to factor the polynomial.

$$2x^3 + 12 = 3x^2 + 8x \quad \text{Given equation}$$

$$2x^3 - 3x^2 - 8x + 12 = 0 \quad \text{Rewrite the equation.}$$

$$(2x^3 - 3x^2) + (-8x + 12) = 0 \quad \text{Associative property}$$

$$x^2(2x - 3) - 4(2x - 3) = 0 \quad \text{Factor.}$$

$$(x^2 - 4)(2x - 3) = 0 \quad \text{Factor out } 2x - 3.$$

$$x^2 - 4 = 0 \quad \text{or} \quad 2x - 3 = 0 \quad \text{Zero-product property}$$

$$x = \pm 2 \quad \text{or} \quad x = \frac{3}{2} \quad \text{Solve each equation.}$$

The solutions are -2 , $\frac{3}{2}$, and 2 .

Now Try Exercises 79 and 89 ◀

Algebra Review

To review factoring by grouping, see Chapter R (page R-21).

Some types of polynomial equations cannot be solved easily by factoring. The next example illustrates how we can obtain an approximate solution graphically.

EXAMPLE 12 Finding a solution graphically

Solve the equation $\frac{1}{2}x^3 - 2x - 4 = 0$ graphically. Round to the nearest hundredth.

SOLUTION A graph of $Y_1 = .5X^3 - 2X - 4$ is shown in Figure 4.68. Since there is only one x -intercept, the equation has one real solution: $x \approx 2.65$.

Calculator Help

To find a zero of a function, see Appendix A (page AP-9).

$[-9, 9, 1]$ by $[-6, 6, 1]$

Figure 4.68

Now Try Exercise 97 ◀

Intermediate Value Property (Optional)

In Example 12, we approximated a solution to $\frac{1}{2}x^3 - 2x - 4 = 0$ to be 2.65. How do we know for sure that there is indeed such a solution? The *intermediate value property* helps answer this question.

Intermediate Value Property

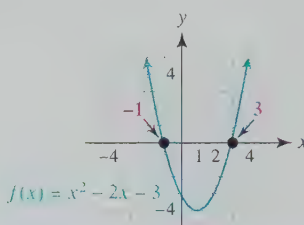

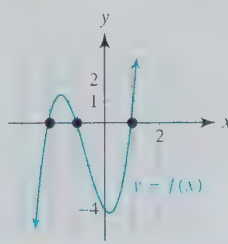

Let (x_1, y_1) and (x_2, y_2) , with $y_1 \neq y_2$ and $x_1 < x_2$, be two points on the graph of a continuous function f . Then, on the interval $x_1 \leq x \leq x_2$, f assumes every value between y_1 and y_2 at least once.

From Example 12, let $f(x) = \frac{1}{2}x^3 - 2x - 4$. Because $f(0) = -4$ and $f(3) = 3.5$, the points $(0, -4)$ and $(3, 3.5)$ lie on the graph of f in Figure 4.68. By the intermediate value property, $f(x) = 0$ for at least one x -value, because 0 is between -4 and 3.5 . Although we have not found the exact x -value, we know that a real zero of f does exist. Loosely speaking, the intermediate value property says that if $y_1 < 0$ and $y_2 > 0$, then we cannot draw a continuous graph of f without crossing the x -axis. The only way not to cross the x -axis would be to pick up the pencil, but this would create a discontinuous graph.

Applications There are many examples of the intermediate value property. Physical motion is usually considered to be continuous. Suppose at one time a car is traveling at 20 miles per hour and at another time it is traveling at 40 miles per hour. It is logical to assume that the car traveled 30 miles per hour at least once between these times. In fact, by the intermediate value property, the car must have assumed all speeds between 20 and 40 miles per hour at least once. Similarly, if a jet airliner takes off and flies at an altitude of 30,000 feet, then by the intermediate value property we may conclude that the airliner assumed all altitudes between ground level and 30,000 feet at least once.

4.4 Putting It All Together

The following table summarizes important topics about real zeros of polynomial functions.

Concept	Explanation	Examples
Factor theorem	$(x - k)$ is a factor of $f(x)$ if and only if $f(k) = 0$.	$f(x) = x^2 + 3x - 4$ and $f(1) = 0$ implies that $(x - 1)$ is a factor of $f(x)$. That is, $f(x) = (x - 1)(x + 4)$.
x -intercepts, zeros, and factors	The following are <i>equivalent</i> : <ol style="list-style-type: none"> The graph of f has x-intercept k. A real zero of f is k. That is, $f(k) = 0$. A factor of f is $(x - k)$. 	Let $f(x) = x^2 - 2x - 3$. See the graph below. <ol style="list-style-type: none"> The graph of f has x-intercepts -1 and 3. $f(-1) = 0$ and $f(3) = 0$ $f(x) = (x + 1)(x - 3)$ 
Complete factored form	$f(x) = a_n(x - c_1) \cdots (x - c_n)$, where the c_k are zeros of f , with a distinct zero listed as many times as its multiplicity. This form is unique.	$f(x) = 3(x - 5)(x + 3)(x + 3)$ $= 3(x - 5)(x + 3)^2$ $a_n = 3, c_1 = 5, c_2 = -3, c_3 = -3$
Real zero with odd multiplicity	The graph of $y = f(x)$ crosses the x -axis at a real zero of odd multiplicity.	$f(x) = (x + 1)^3(x - 3)$ Both zeros, -1 and 3 , have odd multiplicity.
Real zero with even multiplicity	The graph of $y = f(x)$ intersects but does not cross the x -axis at a real zero of even multiplicity.	$f(x) = (x + 1)^2(x - 3)^4$ Both zeros, -1 and 3 , have even multiplicity.
Factoring a polynomial graphically (only real zeros)	Graph $y = f(x)$ and locate all the zeros or x -intercepts. If the leading coefficient is a and the zeros are c_1, c_2 , and c_3 , then $f(x) = a(x - c_1)(x - c_2)(x - c_3)$.	$f(x) = 2x^3 + 4x^2 - 2x - 4$ has zeros $-2, -1$, and 1 and leading coefficient 2 . Thus $f(x) = 2(x + 2)(x + 1)(x - 1)$. 

continued from previous page

4.4 Exercises

Factoring Polynomials

Exercises 1–4: Use the graph and the factor theorem to list the factors of $f(x)$.

10. $f(x) = 3x^4 - 8x^3 - 67x^2 + 112x + 240$;
zeros: $-4, -\frac{4}{3}, 3$, and 5

11. Let $f(x)$ be a quadratic polynomial with leading coefficient 7. Suppose that $f(-3) = 0$ and $f(2) = 0$. Write the complete factored form of $f(x)$.

12. Let $g(x)$ be a cubic polynomial with leading coefficient -4 . Suppose that $g(-2) = 0$, $g(1) = 0$, and $g(4) = 0$. Write the complete factored form of $g(x)$.

Exercises 13 and 14: Use the graph to factor $f(x)$.

13. $f(x) = -2x^3 + 2x$

14. $f(x) = \frac{1}{4}x^4 - \frac{3}{2}x^3 + \frac{3}{4}x^2 + \frac{13}{2}x - 6$

Exercises 5–12: Use the given zeros to write the complete factored form of $f(x)$.

5. $f(x) = 2x^2 - 25x + 77$; zeros: $\frac{11}{2}$ and 7

6. $f(x) = 6x^2 + 21x - 90$; zeros: -6 and $\frac{5}{2}$

7. $f(x) = x^3 - 2x^2 - 5x + 6$; zeros: -2 , 1 , and 3

8. $f(x) = x^3 + 6x^2 + 11x + 6$; zeros: -3 , -2 , and -1

9. $f(x) = -2x^3 + 3x^2 + 59x - 30$; zeros: -5 , $\frac{1}{2}$, and 6

Exercises 15–18: The graph of a polynomial $f(x)$ with leading coefficient ± 1 and integer zeros is shown in the figure. Write its complete factored form.

15.

16.

17.

18.

19. Let $f(x)$ be a cubic polynomial with zeros -1 , 2 , and 3 . If the graph of f passes through the point $(0, 3)$, write the complete factored form of $f(x)$.

20. Let $g(x)$ be a quartic polynomial with zeros -2 , -1 , 1 , and 2 . If the graph of g passes through the point $(0, 8)$, write the complete factored form of $g(x)$.

Exercises 21–24: The graph of a polynomial $f(x)$ with integer zeros is shown in the figure. Write its complete factored form. Note that the leading coefficient of $f(x)$ is not ± 1 .

21.

22.

23.

24.

Exercises 25–30: Use graphing to factor $f(x)$.

25. $f(x) = 10x^2 + 17x - 6$

26. $f(x) = 2x^3 + 7x^2 + 2x - 3$

27. $f(x) = -3x^3 - 3x^2 + 18x$

28. $f(x) = \frac{1}{2}x^3 + \frac{5}{2}x^2 + x - 4$

29. $f(x) = x^4 + \frac{5}{2}x^3 - 3x^2 - \frac{9}{2}x$

30. $f(x) = 10x^4 + 7x^3 - 27x^2 + 2x + 8$

Exercises 31–36: (Refer to Example 4.) Write the complete factored form of the polynomial $f(x)$, given that k is a zero.

31. $f(x) = x^3 - 9x^2 + 23x - 15$ $k = 1$

32. $f(x) = 2x^3 + x^2 - 11x - 10$ $k = -2$

33. $f(x) = -4x^3 - x^2 + 51x - 36$ $k = -4$

34. $f(x) = 3x^3 - 11x^2 - 35x + 75$ $k = 5$

35. $f(x) = 2x^4 - x^3 - 13x^2 - 6x$ $k = -2$

36. $f(x) = 35x^4 + 48x^3 - 41x^2 + 6x$ $k = \frac{3}{7}$

Factor Theorem

Exercises 37–40: Use the factor theorem to decide if $x - k$ is a factor of $f(x)$ for the given k .

37. $f(x) = x^3 - 6x^2 + 11x - 6$ $k = 2$

38. $f(x) = x^3 + x^2 - 14x - 24$ $k = -3$

39. $f(x) = x^4 - 2x^3 - 13x^2 - 10x$ $k = 3$

40. $f(x) = 2x^4 - 11x^3 + 9x^2 + 14x$ $k = \frac{1}{2}$

Graphs and Multiple Zeros

Exercises 41 and 42: The graph of a polynomial $f(x)$ is shown in the figure. Estimate the zeros and state whether their multiplicities are odd or even. State the minimum degree of $f(x)$.

41.

42.

Exercises 43–46: Write a polynomial $f(x)$ in complete factored form that satisfies the conditions. Let the leading coefficient be 1.

43. Degree 3; zeros: -1 with multiplicity 2, and 6 with multiplicity 1

44. Degree 4; zeros: 5 and 7 , both with multiplicity 2

45. Degree 4; zeros: 2 with multiplicity 3, and 6 with multiplicity 1

46. Degree 5; zeros: -2 with multiplicity 2, and 4 with multiplicity 3

Exercises 47–52: The graph of either a cubic, quartic, or quintic polynomial $f(x)$ with integer zeros is shown. Write the complete factored form of $f(x)$. (Hint: In Exercises 51 and 52 the leading coefficient is not ± 1 .)

51.

52.

Exercises 53–56: Complete the following.

- Find the x - and y -intercepts.
- Determine the multiplicity of each zero of f .
- Sketch a graph of $y = f(x)$ by hand.

53. $f(x) = 2(x + 2)(x + 1)^2$

54. $f(x) = -(x + 1)(x - 1)(x - 2)$

55. $f(x) = x^2(x + 2)(x - 2)$

56. $f(x) = -\frac{1}{2}(x + 2)^2(x - 1)^3$

Rational Zeros

Exercises 57–64: (Refer to Example 8.)

- Use the rational zero test to find any rational zeros of the polynomial $f(x)$.
- Write the complete factored form of $f(x)$.

57. $f(x) = 2x^3 + 3x^2 - 8x + 3$

58. $f(x) = x^3 - 7x + 6$

59. $f(x) = 2x^4 + x^3 - 8x^2 - x + 6$

60. $f(x) = 2x^4 + x^3 - 19x^2 - 9x + 9$

61. $f(x) = 3x^3 - 16x^2 + 17x - 4$

62. $f(x) = x^3 + 2x^2 - 3x - 6$

63. $f(x) = x^3 - x^2 - 7x + 7$

64. $f(x) = 2x^3 - 5x^2 - 4x + 10$

Descartes' Rule of Signs

Exercises 65–70: Use Descartes' rule of signs to determine the possible number of positive and negative real zeros for each function. Then, use a graph to determine the actual numbers of positive and negative real zeros.

65. $P(x) = 2x^3 - 4x^2 + 2x + 7$

66. $P(x) = x^3 + 2x^2 + x - 10$

67. $P(x) = 5x^4 + 3x^2 + 2x - 9$

68. $P(x) = 3x^4 + 2x^3 - 8x^2 - 10x - 1$

69. $P(x) = x^5 + 3x^4 - x^3 + 2x + 3$

70. $P(x) = 2x^5 - x^4 + x^3 - x^2 + x + 5$

Polynomial Equations*Exercises 71–76: Solve the equation*

(a) symbolically,

(b) graphically, and

(c) numerically.

71. $x^3 + x^2 - 6x = 0$

72. $2x^2 - 8x + 6 = 0$

73. $x^4 - 1 = 0$

74. $x^4 - 5x^2 + 4 = 0$

75. $-x^3 + 4x = 0$

76. $6 - 4x - 2x^2 = 0$

Exercises 77–96: Solve the equation.

77. $x^3 - 25x = 0$

78. $x^4 - x^3 - 6x^2 = 0$

79. $x^4 - x^2 = 2x^2 + 4$

80. $x^4 + 5 = 6x^2$

81. $x^3 - 3x^2 - 18x = 0$

82. $x^4 - x^2 = 0$

83. $2x^3 = 4x^2 - 2x$

84. $x^3 = x$

85. $12x^3 = 17x^2 + 5x$

86. $3x^3 + 3x = 10x^2$

87. $9x^4 + 4 = 13x^2$

88. $4x^4 + 7x^2 - 2 = 0$

89. $4x^3 + 4x^2 - 3x - 3 = 0$

90. $9x^3 + 27x^2 - 2x - 6 = 0$

91. $2x^3 + 4 = x(x + 8)$

92. $3x^3 + 18 = x(2x + 27)$

93. $8x^4 = 30x^2 - 27$

94. $4x^4 - 21x^2 + 20 = 0$

95. $x^6 - 19x^3 = 216$

96. $x^6 = 7x^3 + 8$

 *Exercises 97–102: (Refer to Example 12.) Solve the equation graphically. Round your answers to the nearest hundredth.*

97. $x^3 - 1.1x^2 - 5.9x + 0.7 = 0$

98. $x^3 + x^2 - 18x + 13 = 0$

99. $-0.7x^3 - 2x^2 + 4x + 2.5 = 0$

100. $3x^3 - 46x^2 + 180x - 99 = 0$

101. $2x^4 - 1.5x^3 + 13 = 24x^2 + 10x$

102. $-x^4 + 2x^3 + 20x^2 = 22x + 41$

Intermediate Value Property*Exercises 103–106: Use the intermediate value property to show that $f(x) = 0$ for some x on the given interval.*

103. $f(x) = x^2 - 5$, $2 \leq x \leq 3$ (Hint: Evaluate $f(2)$ and $f(3)$ and then apply the intermediate value property.)

104. $f(x) = x^3 - x - 1$, $1 \leq x \leq 2$

105. $f(x) = 2x^3 - 1$, $0 \leq x \leq 1$

106. $f(x) = 4x^2 - x - 1$, $-1 \leq x \leq 0$

107. Let $f(x) = x^5 - x^2 + 4$. Evaluate $f(1)$ and $f(2)$. Is there a real number k such that $f(k) = 20$? Explain your answer.

108. Sketch a graph of a function f that passes through the points $(-2, 3)$ and $(1, -2)$ but never assumes a value of 0. What must be true about the graph of f ?

Applications

109. **Winter Temperature** The temperature T in degrees Fahrenheit on a cold night x hours past midnight can be approximated by $T(x) = x^3 - 6x^2 + 8x$, where $0 \leq x \leq 4$. Determine when the temperature was 0°F .

110. **Geometry** A rectangular box has sides with lengths x , $x + 1$, and $x + 2$. If the volume of the box is 504 cubic inches, find the dimensions of the box.

 111. **Floating Ball** (Refer to Example 7.) If a ball has a 20-centimeter diameter, then

$$f(x) = \frac{\pi}{3}x^3 - 10\pi x^2 + \frac{4000\pi d}{3}$$

determines the depth that it sinks in water. Find the depth that this size ball sinks when $d = 0.6$.

 112. **Floating Ball** (Refer to Example 7.) Determine the depth that a pine ball with a 10-centimeter diameter sinks in water, if $d = 0.55$.

113. **Bird Populations** (Refer to Example 5.) A bird population can be modeled by

$$f(x) = x^3 - 66x^2 + 1052x + 1652,$$

where $x = 1$ corresponds to June 1, $x = 2$ to June 2, and so on. Find the days when f estimates that there were 3500 birds.

114. **Insect Population** An insect population P in thousands per acre x days past May 31 is approximated by $P(x) = 2x^3 - 18x^2 + 46x$, where $0 \leq x \leq 6$. Determine the dates when the insect population equaled 30 thousand per acre.

115. **Modeling Temperature** Complete the following.

- Approximate the complete factored form of $f(x) = -0.184x^3 + 1.45x^2 + 10.7x - 27.9$.
- The cubic polynomial $f(x)$ models monthly average temperature at Trout Lake, Canada, in degrees Fahrenheit, where $x = 1$ corresponds to January and $x = 12$ represents December. Interpret the zeros of f .

116. **Average High Temperatures** The monthly average high temperatures in degrees Fahrenheit at Daytona Beach can be modeled by

$$f(x) = 0.0151x^4 - 0.438x^3 + 3.60x^2 - 6.49x + 72.5,$$

where $x = 1$ corresponds to January and $x = 12$ represents December.

- Find the average high temperature during March and July.
- Graph f in $[0.5, 12.5, 1]$ by $[60, 100, 10]$. Interpret the graph.
- Estimate graphically and numerically when the average high temperature is 80°F .

Polynomial Regression

117. **Water Pollution** In one study, freshwater mussels were used to monitor copper discharge into a river from an electroplating works. Copper in high doses can be lethal to aquatic life. The table lists copper concentrations in mussels after 45 days at various distances downstream from the plant. The concentration C is measured in micrograms of copper per gram of mussel x kilometers downstream.

x	5	21	37	53	59
C	20	13	9	6	5

Source: R. Foster and J. Bates, "Use of mussels to monitor point source industrial discharges."

- Describe the relationship between x and C .
- Use regression to find a cubic polynomial function $f(x)$ that models the data.
- Graph C and the data.
- Concentrations above 10 are lethal to mussels. Locate this region in the river.

118. **Dog Years** There is a saying that every year of a dog's life is equal to 7 years for a human. A more accurate approximation is given by the graph of f . Given a dog's age x , where $x \geq 1$, $f(x)$ models the equivalent age in human years. According to the Bureau of the Census, middle age for people begins at age 45. (Source: J. Brearley and A. Nicholas, *This Is the Bichon Frise*.)

- Use the graph of f to estimate the equivalent age for dogs.
- Estimate $f(x)$ at $x = 2, 6, 10, 14$, and 18 .
- Use regression and the points you estimated to find a quartic polynomial function f that models the data points.
- Use $f(x)$ to solve part (a) either graphically or numerically.

Writing about Mathematics

119. Suppose that $f(x)$ is a quintic polynomial with distinct real zeros. Assuming you have access to technology,

explain how to factor $f(x)$ approximately. Have you used the factor theorem? Explain.

120. Explain how to determine graphically whether a zero of a polynomial is a multiple zero. Sketch examples.

EXTENDED AND DISCOVERY EXERCISES

Exercises 1–6: Boundedness Theorem The boundedness theorem shows how the bottom row of a synthetic division is used to place upper and lower bounds on possible real zeros of a polynomial function.

Boundedness Theorem

Let $P(x)$ define a polynomial function of degree $n \geq 1$ with real coefficients and with a positive leading coefficient. If $P(x)$ is divided synthetically by $x - c$ and

- if $c > 0$ and all numbers in the bottom row of the synthetic division are nonnegative, then $P(x)$ has no zero greater than c ;
- if $c < 0$ and the numbers in the bottom row of the synthetic division alternate in sign (with 0 considered positive or negative, as needed), then $P(x)$ has no zero less than c .

Use the boundedness theorem to show that the real zeros of each polynomial function satisfy the given conditions.

- $P(x) = x^4 - x^3 + 3x^2 - 8x + 8$;
no real zero greater than 2
- $P(x) = 2x^5 - x^4 + 2x^3 - 2x^2 + 4x - 4$;
no real zero greater than 1
- $P(x) = x^4 + x^3 - x^2 + 3$;
no real zero less than -2
- $P(x) = x^5 + 2x^3 - 2x^2 + 5x + 5$;
no real zero less than -1
- $P(x) = 3x^4 + 2x^3 - 4x^2 + x - 1$;
no real zero greater than 1
- $P(x) = 3x^4 + 2x^3 - 4x^2 + x - 1$;
no real zero less than -2

CHECKING BASIC CONCEPTS FOR SECTIONS 4.3 AND 4.4

1. Simplify the expression $\frac{5x^4 - 10x^3 + 5x^2}{5x^2}$.

2. Divide the expression.

(a) $\frac{x^3 - x^2 + 4x - 4}{x - 1}$

(b) $\frac{2x^3 - 3x^2 + 4x + 4}{2x + 1}$

(c) $\frac{x^4 - 3x^3 + 6x^2 - 13x + 9}{x^2 + 4}$

3. Use the graph of the cubic polynomial $f(x)$ in the next column to determine its complete factored form. State the multiplicity of each zero. Assume that all zeros are integers and that the leading coefficient is *not* ± 1 .

4. Solve $x^3 - 2x^2 - 15x = 0$.

5. Determine graphically the zeros of

$$f(x) = x^4 - x^3 - 18x^2 + 16x + 32.$$

Write $f(x)$ in complete factored form.

4.5 The Fundamental Theorem of Algebra

- Apply the fundamental theorem of algebra
- Factor polynomials having complex zeros
- Solve polynomial equations having complex solutions

Introduction

In Section 3.2 the quadratic formula was used to solve $ax^2 + bx + c = 0$. Are there similar formulas for higher degree polynomial equations? One of the most spectacular mathematical achievements during the sixteenth century was the discovery of formulas for solving cubic and quartic equations. This was accomplished by the Italian mathematicians Tartaglia, Cardano, Fior, del Ferro, and Ferrari between 1515 and 1545. These formulas are quite complicated and typically used only in computer software. Another spectacular result came from Carl Friedrich Gauss in 1797. He proved that all polynomials can be completely factored by using complex numbers. This result is called the *fundamental theorem of algebra*. Between 1750 and 1780 both Euler and Lagrange failed at finding symbolic solutions to the quintic equation $ax^5 + bx^4 + cx^3 + dx^2 + ex + k = 0$. Later, in about 1805, the Italian physician Ruffini proved that finding formulas for quintic or higher degree equations was impossible. His results make it necessary for us to rely on numerical and graphical methods. (Source: H. Eves, *An Introduction to the History of Mathematics*.)

Fundamental Theorem of Algebra

One of the most brilliant mathematicians of all time, Carl Friedrich Gauss proved the fundamental theorem of algebra as part of his doctoral thesis at age 20. Although his theorem and proof were completed in 1797, they are still valid today.

Fundamental Theorem of Algebra

A polynomial $f(x)$ of degree n , with $n \geq 1$, has at least one complex zero.

The fundamental theorem of algebra guarantees that *every polynomial has a complete factorization*, if we are allowed to use complex numbers. (A complex number can be written as $a + bi$. If $b = 0$, then the complex number $a + bi$ is also a real number.)

If $f(x)$ is a polynomial of degree 1 or higher, then by the fundamental theorem of algebra there is a zero c_1 such that $f(c_1) = 0$. By the factor theorem, $(x - c_1)$ is a factor of $f(x)$ and $f(x) = (x - c_1)q_1(x)$ for some polynomial $q_1(x)$. If $q_1(x)$ has positive degree, then by the fundamental theorem of algebra there exists a zero c_2 of $q_1(x)$. By the factor theorem, $q_1(x)$ can be written as $q_1(x) = (x - c_2)q_2(x)$. Then

$$f(x) = (x - c_1)q_1(x) = (x - c_1)(x - c_2)q_2(x).$$

If $f(x)$ has degree n , this process can be continued until $f(x)$ is written in the complete factored form

$$f(x) = a_n(x - c_1)(x - c_2) \cdots (x - c_n),$$

where a_n is the leading coefficient and the c_k are complex zeros of $f(x)$. If each c_k is distinct, then $f(x)$ has n zeros. However, in general the c_k may not be distinct since multiple zeros are possible.

Number of Zeros Theorem

A polynomial of degree n has at most n distinct zeros.

EXAMPLE 1 Classifying zeros

All zeros for the given polynomials are distinct. Use Figures 4.69–4.71 to determine graphically the number of real zeros and the number of imaginary zeros.

- (a) $f(x) = 3x^3 - 3x^2 - 3x - 5$ (b) $g(x) = 2x^2 + x + 1$
 (c) $h(x) = -x^4 + 4x^2 + 4$

Figure 4.69

Figure 4.70

Figure 4.71

SOLUTION

Getting Started Each (distinct) real zero corresponds to an x -intercept. Imaginary zeros do *not* correspond to x -intercepts, but their number can be determined after the number of real zeros is known. ►

- (a) The graph of $f(x)$ in Figure 4.69 crosses the x -axis once so there is one real zero. Since f is degree 3 and all zeros are distinct, there are two imaginary zeros.
 (b) The graph of $g(x)$ in Figure 4.70 never crosses the x -axis. Since g is degree 2, there are no real zeros and two imaginary zeros.
 (c) The graph of $h(x)$ is shown in Figure 4.71. Since h is degree 4, there are two real zeros and the remaining two zeros are imaginary. **Now Try Exercises 1, 3, and 5** ◀

EXAMPLE 2 Constructing a polynomial with prescribed zeros

Represent a polynomial $f(x)$ of degree 4 with leading coefficient 2 and zeros -3 , 5 , i , and $-i$ in (a) complete factored form and (b) expanded form.

SOLUTION

- (a) Let $a_n = 2$, $c_1 = -3$, $c_2 = 5$, $c_3 = i$, and $c_4 = -i$. Then

$$f(x) = 2(x + 3)(x - 5)(x - i)(x + i).$$

- (b) To expand this expression for $f(x)$, perform the following steps.

$$\begin{aligned} 2(x + 3)(x - 5)(x - i)(x + i) &= 2(x + 3)(x - 5)(x^2 + 1) \\ &= 2(x + 3)(x^3 - 5x^2 + x - 5) \\ &= 2(x^4 - 2x^3 - 14x^2 - 2x - 15) \\ &= 2x^4 - 4x^3 - 28x^2 - 4x - 30 \end{aligned}$$

Thus $f(x) = 2x^4 - 4x^3 - 28x^2 - 4x - 30$.

Now Try Exercise 13 ◀

EXAMPLE 3 Factoring a cubic polynomial with imaginary zeros

Determine the complete factored form for $f(x) = x^3 + 2x^2 + 4x + 8$.

SOLUTION We can use factoring by grouping to determine the complete factored form.

$$\begin{aligned} x^3 + 2x^2 + 4x + 8 &= (x^3 + 2x^2) + (4x + 8) && \text{Associative property} \\ &= x^2(x + 2) + 4(x + 2) && \text{Distributive property} \\ &= (x^2 + 4)(x + 2) && \text{Factor out } x + 2. \end{aligned}$$

Algebra Review

To review factoring by grouping, see Chapter R (page R-21).

To factor $x^2 + 4$, first find its zeros.

$$\begin{aligned} x^2 + 4 &= 0 \\ x^2 &= -4 \\ x &= \pm\sqrt{-4} \\ x &= \pm 2i \end{aligned}$$

The zeros of $f(x)$ are -2 , $2i$, and $-2i$. Its complete factored form is

$$f(x) = (x + 2)(x - 2i)(x + 2i). \quad \text{Now Try Exercise 29} \blacktriangleleft$$

Conjugate Zeros Notice that in Example 3 both $2i$ and $-2i$ were zeros of $f(x)$. The numbers $2i$ and $-2i$ are conjugates. This result can be generalized.

Conjugate Zeros Theorem

If a polynomial $f(x)$ has only real coefficients and if $a + bi$ is a zero of $f(x)$, then the conjugate $a - bi$ is also a zero of $f(x)$.

EXAMPLE 4 Constructing a polynomial with prescribed zeros

Find a cubic polynomial $f(x)$ with real coefficients, leading coefficient 2, and zeros 3 and $5i$. Express f in (a) complete factored form and (b) expanded form.

SOLUTION

(a) Since $f(x)$ has real coefficients, it must also have a third zero of $-5i$, the conjugate of $5i$. Let $c_1 = 3$, $c_2 = 5i$, $c_3 = -5i$, and $a_n = 2$. The complete factored form is

$$f(x) = 2(x - 3)(x - 5i)(x + 5i).$$

(b) To expand $f(x)$, perform the following steps.

$$\begin{aligned} 2(x - 3)(x - 5i)(x + 5i) &= 2(x - 3)(x^2 + 25) \\ &= 2(x^3 - 3x^2 + 25x - 75) \\ &= 2x^3 - 6x^2 + 50x - 150 \end{aligned}$$

Now Try Exercise 15 \blacktriangleleft

EXAMPLE 5 Finding imaginary zeros of a polynomial

Find the zeros of $f(x) = x^4 + x^3 + 2x^2 + x + 1$, given that one zero is $-i$.

SOLUTION By the conjugate zeros theorem, it follows that i must also be a zero of $f(x)$. Therefore $(x - i)$ and $(x + i)$ are factors of $f(x)$. Because $(x - i)(x + i) = x^2 + 1$, we can use long division to find another quadratic factor of $f(x)$.

$$\begin{array}{r}
 x^2 + x + 1 \\
 x^2 + 0x + 1 \overline{) x^4 + x^3 + 2x^2 + x + 1} \\
 \underline{x^4 + 0x^3 + x^2} \\
 x^3 + x^2 + x \\
 \underline{x^3 + 0x^2 + x} \\
 x^2 + 0x + 1 \\
 \underline{x^2 + 0x + 1} \\
 0
 \end{array}$$

The quotient is $x^2 + x + 1$ with remainder 0. By the division algorithm,

$$x^4 + x^3 + 2x^2 + x + 1 = (x^2 + 1)(x^2 + x + 1).$$

We can use the quadratic formula to find the zeros of $x^2 + x + 1$.

$$\begin{aligned}
 x &= \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \\
 &= \frac{-1 \pm \sqrt{1^2 - 4(1)(1)}}{2(1)} \\
 &= -\frac{1}{2} \pm i\frac{\sqrt{3}}{2}
 \end{aligned}$$

The four zeros of $f(x)$ are $\pm i$ and $-\frac{1}{2} \pm i\frac{\sqrt{3}}{2}$.

Now Try Exercise 21

Polynomial Equations with Complex Solutions

Every polynomial equation of degree n can be written in the form

$$a_n x^n + \cdots + a_2 x^2 + a_1 x + a_0 = 0.$$

If we let $f(x) = a_n x^n + \cdots + a_2 x^2 + a_1 x + a_0$ and write $f(x)$ in complete factored form as

$$f(x) = a_n(x - c_1)(x - c_2) \cdots (x - c_n),$$

then the solutions to the polynomial equation are the zeros c_1, c_2, \dots, c_n of $f(x)$. Solving cubic and quartic polynomial equations with this technique is illustrated in the next two examples.

EXAMPLE 6 Solving a polynomial equation

Solve $x^3 = 3x^2 - 7x + 21$.

SOLUTION Write the equation as $f(x) = 0$, where $f(x) = x^3 - 3x^2 + 7x - 21$. Although we could use factoring by grouping, as is done in Example 3, we use graphing instead to find one real zero of $f(x)$. Figure 4.72 shows that 3 is a zero of $f(x)$. By the factor theorem, $x - 3$ is a factor of $f(x)$. Using synthetic division, we divide $x - 3$ into $f(x)$.

$$\begin{array}{r|rrrrr}
 3 & 1 & -3 & 7 & -21 & \\
 & & 3 & 0 & 21 & \\
 \hline
 & 1 & 0 & 7 & 0 &
 \end{array}$$

$[-5, 5, 1]$ by $[-30, 30, 10]$

Figure 4.72

Thus $x^3 - 3x^2 + 7x - 21 = (x - 3)(x^2 + 7)$, and we can solve as follows.

$$x^3 - 3x^2 + 7x - 21 = 0 \quad f(x) = 0$$

$$(x - 3)(x^2 + 7) = 0 \quad \text{Factor.}$$

$$x - 3 = 0 \quad \text{or} \quad x^2 + 7 = 0 \quad \text{Zero-product property}$$

$$x = 3 \quad \text{or} \quad x^2 = -7 \quad \text{Solve.}$$

$$x = 3 \quad \text{or} \quad x = \pm i\sqrt{7} \quad \text{Property of } i$$

The solutions are 3 and $\pm i\sqrt{7}$.

Now Try Exercise 33

EXAMPLE 7 Solving a polynomial equation

Solve $x^4 + x^2 = x^3$.

SOLUTION Write the equation as $f(x) = 0$, where $f(x) = x^4 - x^3 + x^2$.

$$x^4 - x^3 + x^2 = 0 \quad f(x) = 0$$

$$x^2(x^2 - x + 1) = 0 \quad \text{Factor out } x^2.$$

$$x^2 = 0 \quad \text{or} \quad x^2 - x + 1 = 0 \quad \text{Zero-product property}$$

The only solution to $x^2 = 0$ is 0. To solve $x^2 - x + 1 = 0$, use the quadratic formula, as in Example 5. The solutions are 0 and $\frac{1}{2} \pm i\frac{\sqrt{3}}{2}$.

The graphs of $Y_1 = X^4 + X^2$ and $Y_2 = X^3$ are shown in Figure 4.73. Notice that they appear to intersect only at the origin. This indicates that the only real solution is 0.

Now Try Exercise 37

$[-3, 3, 1]$ by $[-2, 2, 1]$

Figure 4.73

4.5 Putting It All Together

Some of the important topics in this section are summarized in the following table.

Concept	Explanation	Comments and Examples
Number of zeros theorem	A polynomial of degree n has at most n distinct zeros. These zeros can be real or imaginary numbers.	The cubic polynomial, $ax^3 + bx^2 + cx + d,$ has at most 3 distinct zeros.
Fundamental theorem of algebra	A polynomial of degree n , with $n \geq 1$, has at least one complex zero.	This theorem guarantees that we can always factor a polynomial $f(x)$ into complete factored form: $f(x) = a_n(x - c_1) \cdots (x - c_n),$ where the c_k are complex numbers.
Conjugate zeros theorem	If a polynomial has <i>real</i> coefficients and $a + bi$ is a zero, then $a - bi$ is also a zero.	Since $\frac{1}{2} + \frac{1}{2}i$ is a zero of $2x^2 - 2x + 1$, it follows that $\frac{1}{2} - \frac{1}{2}i$ is also a zero.

4.5 Exercises

Zeros of Polynomials

Exercises 1–8: The graph and degree of a polynomial with real coefficients $f(x)$ are given. Determine the number of real zeros and the number of imaginary zeros. Assume that all zeros of $f(x)$ are distinct.

1. Degree 2

2. Degree 2

3. Degree 3

4. Degree 3

5. Degree 4

6. Degree 4

7. Degree 5

8. Degree 5

Exercises 9–18: Let a_n be the leading coefficient.

- (a) Find the complete factored form of a polynomial with real coefficients $f(x)$ that satisfies the conditions.
 (b) Express $f(x)$ in expanded form.

9. Degree 2; $a_n = 1$; zeros $6i$ and $-6i$
10. Degree 3; $a_n = 5$; zeros 2 , i , and $-i$
11. Degree 3; $a_n = -1$; zeros -1 , $2i$, and $-2i$
12. Degree 4; $a_n = 3$; zeros -2 , 4 , i , and $-i$
13. Degree 4; $a_n = 10$; zeros 1 , -1 , $3i$, and $-3i$
14. Degree 2; $a_n = -5$; zeros $1 + i$ and $1 - i$
15. Degree 4; $a_n = \frac{1}{2}$; zeros $-i$ and $2i$
16. Degree 3; $a_n = -\frac{3}{4}$; zeros $-3i$ and $\frac{2}{5}$
17. Degree 3; $a_n = -2$; zeros $1 - i$ and 3
18. Degree 4; $a_n = 7$; zeros $2i$ and $3i$

Exercises 19–22: (Refer to Example 5.) Find the zeros of $f(x)$, given that one zero is k .

19. $f(x) = 3x^3 - 5x^2 + 75x - 125$ $k = \frac{5}{3}$
20. $f(x) = x^4 + 2x^3 + 8x^2 + 8x + 16$ $k = 2i$
21. $f(x) = 2x^4 - x^3 + 19x^2 - 9x + 9$ $k = -3i$
22. $f(x) = 7x^3 + 5x^2 + 12x - 4$ $k = \frac{2}{7}$

Exercises 23–30: Complete the following.

- (a) Find all zeros of $f(x)$.
 (b) Write the complete factored form of $f(x)$.

23. $f(x) = x^2 + 25$
24. $f(x) = x^2 + 11$
25. $f(x) = 3x^3 + 3x$
26. $f(x) = 2x^3 + 10x$
27. $f(x) = x^4 + 5x^2 + 4$
28. $f(x) = x^4 + 4x^2$
29. $f(x) = x^3 + 2x^2 + 16x + 32$
30. $f(x) = x^4 + 2x^3 + x^2 + 8x - 12$

Exercises 31–42: Solve the polynomial equation.

31. $x^3 + x = 0$
32. $2x^3 - x + 1 = 0$
33. $x^3 = 2x^2 - 7x + 14$
34. $x^2 + x + 2 = x^3$

35. $x^4 + 5x^2 = 0$

36. $x^4 - 2x^3 + x^2 - 2x = 0$

45. $I = 1 + 2i$

$Z = 3 - 4i$

37. $x^4 = x^3 - 4x^2$

38. $x^5 + 9x^3 = x^4 + 9x^2$

46. $I = \frac{1}{2} + \frac{1}{4}i$

$Z = 8 - 9i$

39. $x^4 + x^3 = 16 - 8x - 6x^2$

47. $Z = 22 - 5i$

$V = 27 + 17i$

40. $x^4 + 2x^2 = x^3$

41. $3x^3 + 4x^2 + 6 = x$

48. $Z = 10 + 5i$

$V = 10 + 8i$

42. $2x^3 + 5x^2 + x + 12 = 0$

Applications

Exercises 43–48: Electricity Complex numbers are used in the study of electrical circuits. Impedance Z (or the opposition to the flow of electricity), voltage V , and current I can all be represented by complex numbers. They are related by the equation $Z = \frac{V}{I}$. Find the value of the missing variable.

43. $V = 50 + 98i$ $I = 8 + 5i$

44. $V = 30 + 60i$ $I = 8 + 5i$

Writing about Mathematics

50. Give an example of a polynomial function that has only imaginary zeros and a polynomial function that has only real zeros. Explain how to determine graphically if a function has only imaginary zeros.

4.6 Rational Functions and Models

- Identify a rational function and state its domain
- Identify asymptotes
- Interpret asymptotes
- Graph a rational function by using transformations
- Graph a rational function by hand (optional)

Introduction

Rational functions are nonlinear functions that frequently occur in applications. For example, rational functions are used to design curves for railroad tracks, determine stopping distances on hills, and calculate the average number of people waiting in a line.

Rational Functions

A rational number can be expressed as a ratio $\frac{p}{q}$, where p and q are integers with $q \neq 0$. A rational function is defined similarly by using the concept of a polynomial.

Rational Function

A function f represented by $f(x) = \frac{p(x)}{q(x)}$, where $p(x)$ and $q(x)$ are polynomials and $q(x) \neq 0$, is a **rational function**.

The domain of a rational function includes all real numbers *except* the zeros of the denominator $q(x)$. The graph of a rational function is continuous except at x -values where $q(x) = 0$.

Algebra Review

To review rational expressions, see Chapter R (page R-30).

EXAMPLE 1 Identifying rational functions

Determine if the function is rational and state its domain.

(a) $f(x) = \frac{2x - 1}{x^2 + 1}$ (b) $g(x) = \frac{1}{\sqrt{x}}$ (c) $h(x) = \frac{x^3 - 2x^2 + 1}{x^2 - 3x + 2}$

SOLUTION

- (a) Both the numerator, $2x - 1$, and the denominator, $x^2 + 1$, are polynomials, so f is a rational function. The domain of f includes all real numbers because $x^2 + 1 \neq 0$ for any real number x .
- (b) \sqrt{x} is not a polynomial, so g is not a rational function. The domain is $\{x | x > 0\}$.
- (c) Both the numerator and the denominator are polynomials, so h is a rational function. Because

$$x^2 - 3x + 2 = (x - 1)(x - 2) = 0$$

when $x = 1$ or $x = 2$, the domain of h is $\{x | x \neq 1, x \neq 2\}$.

Now Try Exercises 1, 7, and 9

CLASS DISCUSSION

Is an integer a rational number? Is a polynomial function a rational function?

**Vertical Asymptotes**

A rational function given by $f(x) = \frac{p(x)}{q(x)}$ is undefined whenever $q(x) = 0$. If $q(k) = 0$ for some k , then a *vertical asymptote* of the graph of f may occur at $x = k$. Near a vertical asymptote, the y -values on the graph of f become very large (unbounded) in absolute value. Vertical asymptotes can have meaning in many types of applications.

An Application If cars leave a parking garage randomly and stop to pay the parking attendant on the way out, then the average length of the line depends on two factors: the average traffic rate at which cars are exiting the ramp and the average rate at which the parking attendant can wait on cars. For instance, if the average traffic rate is three cars per minute and the parking attendant can serve four cars per minute, then at times a line may form if cars arrive in a *random* manner. The **traffic intensity** x is the ratio of the average traffic rate to the average working rate of the attendant. In this example, $x = \frac{3}{4}$. (Source: F. Mannering and W. Kilareski, *Principles of Highway Engineering and Traffic Control*.)

EXAMPLE 2 Estimating the length of parking garage lines

If the traffic intensity is x , then the average number of cars waiting in line to exit a parking garage can be estimated by $N(x) = \frac{x^2}{2 - 2x}$, where $0 \leq x < 1$.

- (a) Evaluate $N(0.5)$ and $N(0.9)$. Interpret the results.
- (b) Use the graph of $y = N(x)$ in Figure 4.74 to explain what happens to the length of the line as the traffic intensity x increases to 1 from the left (denoted $x \rightarrow 1^-$).

SOLUTION

- (a) $N(0.5) = \frac{0.5^2}{2 - 2(0.5)} = 0.25$ and $N(0.9) = \frac{0.9^2}{2 - 2(0.9)} = 4.05$. This means that if the traffic intensity is 0.5, there is little waiting in line. As the traffic intensity increases to 0.9, the average line has more than four cars.

Figure 4.74 Parking Garage Lines

- (b) As the traffic intensity x approaches 1 from the left in Figure 4.74 (repeated in the margin), the graph of f increases rapidly without bound. Numerical support is given in Table 4.4. With a traffic intensity slightly less than 1, the attendant has difficulty keeping up. If cars occasionally arrive in groups, long lines will form. At $x = 1$ the denominator, $2 - 2x$, equals 0 and $N(x)$ is undefined.

Table 4.4 Traffic Intensity Approaching 1

x	0.94	0.95	0.96	0.97	0.98	0.99	1
$\frac{x^2}{2 - 2x}$	7.36	9.03	11.52	15.68	24.01	49.01	—

Now Try Exercise 93 ◀

Formal Definition In Figure 4.74 (repeated in the margin), the red dashed vertical line $x = 1$ is a *vertical asymptote* of the graph of N . A graph of a different rational function f is shown in Figure 4.75. The $f(x)$ -values *decrease without bound* as x approaches 2 from the left. This is denoted $f(x) \rightarrow -\infty$ as $x \rightarrow 2^-$. Similarly, the $f(x)$ -values *increase without bound* as x approaches 2 from the right. This is expressed as $f(x) \rightarrow \infty$ as $x \rightarrow 2^+$. The red dashed line $x = 2$ is a vertical asymptote of the graph of f .

Figure 4.75

NOTE A vertical asymptote is not part of the graph of a rational function; rather, it is an aid that is used to sketch and to better understand the graph of a rational function.

Vertical Asymptote

The line $x = k$ is a **vertical asymptote** of the graph of f if $f(x) \rightarrow \infty$ or $f(x) \rightarrow -\infty$ as x approaches k from either the left or the right.

If $x = k$ is a vertical asymptote of the graph of f , then k is not in the domain of f . Furthermore, the graph of a rational function f does *not* cross a vertical asymptote.

Horizontal Asymptotes

If the absolute value of x becomes large in the formula $f(x)$ for a rational function, then the graph of f may level off and begin to approximate a horizontal line. This horizontal line is called a *horizontal asymptote*. Horizontal asymptotes can have meaning in many types of applications.

An Application The graph of f in Figure 4.76 is an example of a von Bertalanffy growth curve. It models the length in millimeters of a small fish after x weeks. After several weeks the length of the fish begins to level off near 25 millimeters. Thus $y = 25$ is a

Figure 4.76 Size of a Small Fish

horizontal asymptote of the graph of f . This is denoted by $f(x) \rightarrow 25$ as $x \rightarrow \infty$. (Source: D. Brown and P. Rothery, *Models in Biology*.)

In real-life applications, time does not actually approach infinity. For example, a fish does not live forever. However, the asymptote $y = 25$ does tend to model the length of the fish as it becomes older.

Formal Definition The graph of $f(x) = \frac{x^2}{x^2 + 1}$ is shown in Figure 4.77. The red dashed horizontal line is a horizontal asymptote of the graph of f and indicates that $f(x) \rightarrow 1$ as $x \rightarrow \infty$ or $x \rightarrow -\infty$. For example, $f(10) \approx 0.99$, $f(100) \approx 0.9999$, and $f(1000) \approx 0.999999$.

Figure 4.77

Horizontal Asymptote

The line $y = b$ is a **horizontal asymptote** of the graph of f if $f(x) \rightarrow b$ as x approaches either ∞ or $-\infty$.

NOTE Like a vertical asymptote, a horizontal asymptote is *not* part of the graph of a rational function; rather, it is an aid that is used to sketch and to better understand the graph of a rational function. However, unlike in the case of vertical asymptotes, it is *possible* for the graph of a rational function to *cross* a horizontal asymptote. See Examples 4(c) and 10.

Identifying Asymptotes

Asymptotes can be found visually from a graph and symbolically from a formula. The next two examples discuss these techniques.

EXAMPLE 1 Determining horizontal and vertical asymptotes visually

Use the graph of each rational function to determine any vertical or horizontal asymptotes.

Figure 4.78

Figure 4.79

Figure 4.80

SOLUTION In Figure 4.78, $x = -5$ is a vertical asymptote and $y = 5$ is a horizontal asymptote. In Figure 4.79, $x = \pm 1$ are vertical asymptotes and $y = 1$ is a horizontal asymptote. In Figure 4.80, there are no vertical asymptotes. The x -axis ($y = 0$) is a horizontal asymptote.

Now Try Exercises 13, 15, and 17 ◀

The following technique can be used for rational functions to find vertical and horizontal asymptotes symbolically.

Finding Vertical and Horizontal Asymptotes

Let f be a rational function given by $f(x) = \frac{p(x)}{q(x)}$ written in *lowest terms*.

Vertical Asymptote

To find a vertical asymptote, set the denominator, $q(x)$, equal to 0 and solve. If k is a zero of $q(x)$, then $x = k$ is a vertical asymptote. *Caution:* If k is a zero of both $q(x)$ and $p(x)$, then $f(x)$ is *not* written in lowest terms, and $x - k$ is a common factor.

Horizontal Asymptote

- If the degree of the numerator is less than the degree of the denominator, then $y = 0$ (the x -axis) is a horizontal asymptote.
- If the degree of the numerator equals the degree of the denominator, then $y = \frac{a}{b}$ is a horizontal asymptote, where a is the leading coefficient of the numerator and b is the leading coefficient of the denominator.
- If the degree of the numerator is greater than the degree of the denominator, then there are no horizontal asymptotes.

EXAMPLE 1 Finding asymptotes

For each rational function, determine any horizontal or vertical asymptotes.

- $f(x) = \frac{6x - 1}{3x + 3}$
- $g(x) = \frac{x + 1}{x^2 - 4}$
- $h(x) = \frac{x^2 - 1}{x + 1}$

SOLUTION

- The degrees of the numerator and the denominator are both 1. Since the ratio of the leading coefficients is $\frac{6}{3} = 2$, the graph of f has a horizontal asymptote of $y = 2$. This is supported numerically in Figures 4.81 and 4.82, where the y -values approach 2 as the x -values increase or decrease. (That is, $y \rightarrow 2$ as $x \rightarrow \infty$ and $y \rightarrow 2$ as $x \rightarrow -\infty$.)

When $x = -1$, the denominator, $3x + 3$, equals 0 and the numerator, $6x - 1$, does not equal 0. Thus $x = -1$ is a vertical asymptote. A graph of f is shown in Figure 4.83. Note that it is *not* necessary to graph the function to determine the asymptotes.

- The degree of the numerator is one less than the degree of the denominator, so the x -axis, or $y = 0$, is a horizontal asymptote. When $x = \pm 2$, the denominator, $x^2 - 4$, equals 0 and the numerator, $x + 1$, does not equal 0. Thus $x = \pm 2$ are vertical asymptotes. See Figure 4.84. Note that the graph crosses the horizontal asymptote $y = 0$.

Algebra Review

To review simplifying rational expressions, see Chapter R (page R-30).

Figure 4.85

- (c) The degree of the numerator is greater than the degree of the denominator, so there are no horizontal asymptotes. When $x = -1$, both numerator and denominator equal 0, so the expression is *not* in lowest terms. We can simplify $h(x)$ as follows.

$$h(x) = \frac{x^2 - 1}{x + 1} = \frac{(x + 1)(x - 1)}{x + 1} = x - 1, \quad x \neq -1$$

The graph of $h(x)$ is the line $y = x - 1$ with the point $(-1, -2)$ missing. There are no vertical asymptotes. See Figure 4.85.

Now Try Exercises 21, 23, and 31

Slant, or Oblique, Asymptotes A third type of asymptote, which is neither vertical nor horizontal, occurs when the numerator of a rational function has degree *one more* than the degree of the denominator. For example, let $f(x) = \frac{x^2 + 2}{x - 1}$. If $x - 1$ is divided into $x^2 + 2$, the quotient is $x + 1$ with remainder 3. Thus

$$f(x) = x + 1 + \frac{3}{x - 1}$$

is an equivalent representation of f . For large values of $|x|$, the ratio $\frac{3}{x - 1}$ approaches 0 and the graph of f approaches $y = x + 1$. The line $y = x + 1$ is called a **slant asymptote**, or **oblique asymptote**, of the graph of f . A graph of f with vertical asymptote $x = 1$ and slant asymptote $y = x + 1$ is shown in Figure 4.86.

Figure 4.86

MAKING CONNECTIONS

Division Algorithm and Asymptotes Suppose that the division algorithm is used to write a rational function f in the form

$$f(x) = (\text{Quotient}) + \frac{(\text{Remainder})}{(\text{Divisor})}.$$

1. If the quotient equals a constant k , then $y = k$ is a horizontal asymptote.

Example: $f(x) = \frac{2x - 1}{x - 1} = 2 + \frac{1}{x - 1}$, so $y = 2$ is a horizontal asymptote.

2. If the quotient equals $ax + b$ with $a \neq 0$ (linear), then $y = ax + b$ is a slant asymptote.

Example: $f(x) = \frac{x^2 + 2}{x - 1} = x + 1 + \frac{3}{x - 1}$, so $y = x + 1$ is a slant asymptote.

Graphs and Transformations of Rational Functions

Graphs of rational functions can vary greatly in complexity. We begin by graphing $y = \frac{1}{x}$ and then use transformations to graph other rational functions.

EXAMPLE 5 Analyzing the graph of $y = \frac{1}{x}$

Sketch a graph of $y = \frac{1}{x}$ and identify any asymptotes.

SOLUTION Note that when $x = 0$, the denominator is 0 but the numerator is not. Thus $x = 0$ (the y -axis) is a vertical asymptote. Also, the degree of the numerator is less than the degree of the denominator, so $y = 0$ (the x -axis) is a horizontal asymptote. Table 4.5 on the next page lists points that lie on the graph of $y = \frac{1}{x}$. These points and the graph are shown in Figure 4.87 on the next page.

Table 4.5

x	$y = \frac{1}{x}$
-2	$-\frac{1}{2}$
-1	-1
$-\frac{1}{2}$	-2
0	—
$\frac{1}{2}$	2
1	1
2	$\frac{1}{2}$

Figure 4.87

Now Try Exercise 41 ◀

Figure 4.88

Transformations Transformations of graphs can be used to graph some types of rational functions by hand. For example, we can graph $g(x) = \frac{1}{x-1} + 2$ by translating the graph of $f(x) = \frac{1}{x}$ right 1 unit and upward 2 units. That is, $g(x)$ can be written in terms of $f(x)$ by using the formula $g(x) = f(x-1) + 2$. Because the graph of f in Figure 4.87 has vertical asymptote $x = 0$ and horizontal asymptote $y = 0$, the graph of g in Figure 4.88 has vertical asymptote $x = 1$ and horizontal asymptote $y = 2$.

NOTE If we are given function g in the form $g(x) = \frac{2x-1}{x-1}$, then we can use the division algorithm to divide $x-1$ into $2x-1$ and obtain quotient 2 with remainder 1.

$$\begin{array}{r} 2 \\ x-1 \overline{) 2x-1} \\ \underline{2x-2} \\ 1 \end{array} \quad \frac{2x-1}{x-1} = \frac{2(x-1)+1}{x-1} = 2 + \frac{1}{x-1}$$

Thus $g(x) = 2 + \frac{1}{x-1}$, and we can graph g as in Figure 4.88.

EXAMPLE 10 Using transformations to graph a rational function

Use the graph of $f(x) = \frac{1}{x^2}$ to sketch a graph of $g(x) = -\frac{1}{(x+2)^2}$. Include all asymptotes in your graph. Write $g(x)$ in terms of $f(x)$.

SOLUTION The graph of $y = \frac{1}{x^2}$ shown in Figure 4.89 has vertical asymptote $x = 0$ and horizontal asymptote $y = 0$. The graph of $g(x) = -\frac{1}{(x+2)^2}$ is a translation of the graph of $f(x) = \frac{1}{x^2}$ left 2 units and then a reflection across the x -axis. The vertical asymptote for $y = g(x)$ is $x = -2$ and the horizontal asymptote is $y = 0$, as shown in Figure 4.90. We can write $g(x)$ in terms of $f(x)$ as $g(x) = -f(x+2)$.

Figure 4.89

Figure 4.90

Now Try Exercise 51 ◀

Calculator Help

To set dot mode, see Appendix A (page AP-8). To set a decimal window, see Appendix A (page AP-13).

Graphing with Technology Although many graphing calculators have difficulty accurately showing some features of the graph of a rational function, they can be helpful when they are used in conjunction with symbolic techniques.

NOTE Calculators often graph in connected or dot mode. (See Example 7.) If connected mode is used to graph a rational function, it may appear as though the calculator is graphing vertical asymptotes automatically. However, in most instances the calculator is connecting points inappropriately. Sometimes rational functions can be graphed in connected mode using a *decimal* or *friendly* viewing rectangle.

EXAMPLE 7 Analyzing a rational function with technology

Let $f(x) = \frac{2x^2 + 1}{x^2 - 4}$.

- Use a calculator to graph f . Find the domain of f .
- Identify any vertical or horizontal asymptotes.
- Sketch a graph of f that includes the asymptotes.

SOLUTION

- A calculator graph of f using dot mode is shown in Figure 4.91. The function is undefined when $x^2 - 4 = 0$, or when $x = \pm 2$. The domain of function f is given by $D = \{x \mid x \neq 2, x \neq -2\}$.
- When $x = \pm 2$, the denominator, $x^2 - 4$, equals 0 and the numerator, $2x^2 + 1$, does not equal 0. Therefore $x = \pm 2$ are vertical asymptotes. The degree of the numerator equals the degree of the denominator, and the ratio of the leading coefficients is $\frac{2}{1} = 2$. A horizontal asymptote of the graph of f is $y = 2$.
- A second graph of f and its asymptotes is shown in Figure 4.92.

$[-6, 6, 1]$ by $[-6, 6, 1]$

Figure 4.91 Dot Mode

Figure 4.92

Now Try Exercise 57 ◀

Graphs with “Holes” If $f(x) = \frac{p(x)}{q(x)}$, then it is possible that, for some number k , both $p(k) = 0$ and $q(k) = 0$. In this case, the graph of f may *not* have a vertical asymptote at $x = k$; rather, it may have a “hole” at $x = k$. See the next example and Figure 4.85.

EXAMPLE 8 Graphing a rational function having a “hole”

Graph $f(x) = \frac{2x^2 - 5x + 2}{x^2 - 3x + 2}$ by hand.

SOLUTION First factor the numerator and the denominator.

$$\frac{2x^2 - 5x + 2}{x^2 - 3x + 2} = \frac{(2x - 1)(x - 2)}{(x - 1)(x - 2)} = \frac{2x - 1}{x - 1}, \quad x \neq 2$$

Figure 4.93

After factoring, it is apparent that both the numerator and the denominator equal 0 when $x = 2$. Therefore we simplify the rational expression to lowest terms and restrict the domain to $x \neq 2$.

From our previous work, long division can be used to show that $f(x) = \frac{2x-1}{x-1}$ is equivalent to $f(x) = 2 + \frac{1}{x-1}$. Thus the graph of f is similar to Figure 4.88 except that the point $(2, 3)$ is missing and an open circle appears in its place. See Figure 4.93.

Now Try Exercise 69 ◀

Graphing Rational Functions by Hand (Optional)

To graph a rational function by hand, we sometimes need to solve a rational equation of the form $\frac{a}{b} = \frac{c}{d}$. One way to solve this equation is to **cross multiply** and obtain $ad = bc$, provided b and d are nonzero. Consider the following example.

$\frac{2x - 1}{3x + 2} = \frac{5}{4}$	Given equation
$4(2x - 1) = 5(3x + 2)$	Cross multiply
$8x - 4 = 15x + 10$	Simplify.
$-7x = 14$	Subtract $15x$; add 4.
$x = -2$	Divide by -7 . The answer checks.

The following guidelines can be used to graph a rational function by hand.

Graphing a Rational Function

Let $f(x) = \frac{p(x)}{q(x)}$ define a rational function in *lowest* terms. To sketch its graph, follow these steps:

- STEP 1: Find all vertical asymptotes.
- STEP 2: Find all horizontal or oblique asymptotes.
- STEP 3: Find the y -intercept, if possible, by evaluating $f(0)$.
- STEP 4: Find the x -intercepts, if any, by solving $f(x) = 0$. (These will be the zeros of the numerator $p(x)$.)
- STEP 5: Determine whether the graph will intersect its nonvertical asymptote $y = b$ by solving $f(x) = b$, where b is the y -value of the horizontal asymptote, or by solving $f(x) = mx + b$, where $y = mx + b$ is the equation of the oblique asymptote.
- STEP 6: Plot selected points as necessary. Choose an x -value in each interval of the domain determined by the vertical asymptotes and x -intercepts.
- STEP 7: Complete the sketch.

EXAMPLE 1 Graphing a rational function by hand

Graph $f(x) = \frac{2x + 1}{x - 3}$.

SOLUTION

Getting Started As you go through Steps 1 through 7, be sure to sketch all asymptotes first and then plot some key points. Finally, sketch the entire graph. ▶

STEP 1: The vertical asymptote has equation $x = 3$.

STEP 2: The horizontal asymptote has equation $y = 2$.

STEP 3: $f(0) = -\frac{1}{3}$, so the y -intercept is $-\frac{1}{3}$.

STEP 4: Solve $f(x) = 0$ to find any x -intercepts.

$$\frac{2x + 1}{x - 3} = 0$$

$$2x + 1 = 0$$

$$x = -\frac{1}{2}$$

If a fraction equals 0, its numerator must be 0.

The x -intercept is $-\frac{1}{2}$.

STEP 5: The graph does not intersect its horizontal asymptote, since $f(x) = 2$ has no solution. (Verify this.)

STEPS 6 AND 7: The points $(-4, 1)$, $(1, -\frac{3}{2})$, and $(6, \frac{13}{3})$ are on the graph and can be used to complete the sketch, shown in Figure 4.94.

Now Try Exercise 87 ◀

Figure 4.94

EXAMPLE 10 Graphing a function that intersects its horizontal asymptote

$$\text{Graph } f(x) = \frac{3x^2 - 3x - 6}{x^2 + 8x + 16}.$$

SOLUTION

STEP 1: To find the vertical asymptote(s), solve $x^2 + 8x + 16 = 0$.

$$x^2 + 8x + 16 = 0$$

$$(x + 4)^2 = 0$$

$$x = -4$$

Since the numerator is not 0 when $x = -4$, the only vertical asymptote has equation $x = -4$.

STEP 2: Because the degrees of the numerator and denominator both equal 2, the ratio of the leading coefficients can be used to find the horizontal asymptote.

$$y = \frac{3}{1}, \quad \begin{array}{l} \leftarrow \text{Leading coefficient of numerator} \\ \leftarrow \text{Leading coefficient of denominator} \end{array}$$

or $y = 3$.

STEP 3: The y -intercept is $f(0) = -\frac{3}{8}$.

STEP 4: To find the x -intercept(s), if any, solve $f(x) = 0$.

$$\frac{3x^2 - 3x - 6}{x^2 + 8x + 16} = 0$$

$$3x^2 - 3x - 6 = 0$$

$$x^2 - x - 2 = 0$$

$$(x - 2)(x + 1) = 0$$

$$x = 2 \quad \text{or} \quad x = -1$$

Set the numerator equal to 0.

Divide by 3.

Factor.

Zero-product property

The x -intercepts are -1 and 2 .

STEP 5: Because the horizontal asymptote is $y = 3$, set $f(x) = 3$ and solve to locate the point where the graph intersects the horizontal asymptote.

Figure 4.95

$$\frac{3x^2 - 3x - 6}{x^2 + 8x + 16} = 3$$

$$3x^2 - 3x - 6 = 3x^2 + 24x + 48$$

$$-3x - 6 = 24x + 48$$

$$-27x = 54$$

$$x = -2$$

Let $3 = \frac{3}{1}$; cross multiply.

Subtract $3x^2$.

Subtract $24x$; add 6 .

Divide by -27 .

The graph intersects its horizontal asymptote at $(-2, 3)$.

STEPS 6 AND 7: Some other points that lie on the graph are $(-10, 9)$, $(-8, 13\frac{1}{8})$, and $(5, \frac{2}{3})$. These can be used to complete the graph, shown in Figure 4.95.

Now Try Exercise 91 ◀

4.6 Putting It All Together

The following table summarizes some concepts about rational functions and equations. To determine vertical and horizontal asymptotes see the box on page 312.

Concept	Explanation	Examples
Rational function	$f(x) = \frac{p(x)}{q(x)}$, where $p(x)$ and $q(x)$ are polynomials with $q(x) \neq 0$.	$f(x) = \frac{x - 1}{x^2 + 2x + 1}$ $g(x) = 1 + \frac{1}{x} \quad \left(\text{Note: } 1 + \frac{1}{x} = \frac{x + 1}{x} \right)$
Vertical asymptote	If k is a zero of the denominator, but not of the numerator, then $x = k$ is a vertical asymptote.	The graph of $f(x) = \frac{2x + 1}{x - 2}$ has vertical asymptotes at $x = 2$ because 2 is a zero of $x - 2$, but not a zero of $2x + 1$.
Horizontal asymptote	A horizontal asymptote occurs when the degree of the numerator is less than or equal to the degree of the denominator.	$f(x) = \frac{1 - 4x^2}{3x^2 - x}$ <p>Horizontal asymptote: $y = -\frac{4}{3}$</p> $g(x) = \frac{x}{4x^2 + 2x}$ <p>Horizontal asymptote: $y = 0$</p>
Graph of a rational function	The graph of a rational function is continuous, except at x -values where the denominator equals zero.	<p>The graph of $f(x) = \frac{3x^2 + 1}{x^2 - 4}$ is discontinuous at $x = \pm 2$. It has vertical asymptotes of $x = \pm 2$ and a horizontal asymptote of $y = 3$.</p>

Concept	Explanation	Examples
Basic rational equation	$\frac{a}{b} = \frac{c}{d}$ is equivalent to $ad = bc$, provided b and d are nonzero. Check your answer.	To solve the rational equation $\frac{4}{2x - 1} = 8,$ write 8 as $\frac{8}{1}$ and cross multiply. $4 = 8(2x - 1)$ $12 = 16x$ $x = \frac{3}{4}$

4.6 Exercises

Rational Functions

Exercises 1–12: Determine whether f is a rational function and state its domain.

- $f(x) = \frac{x^3 - 5x + 1}{4x - 5}$
- $f(x) = \frac{6}{x^2}$
- $f(x) = x^2 - x - 2$
- $f(x) = \frac{x^2 + 1}{\sqrt{x - 8}}$
- $f(x) = \frac{|x - 1|}{x + 1}$
- $f(x) = \frac{4}{x} + 1$
- $f(x) = \frac{3x}{x^2 + 1}$
- $f(x) = \frac{|x + 1|}{x + 1}$
- $f(x) = \frac{3 - \sqrt{x}}{x^2 + x}$
- $f(x) = \frac{x^3 - 3x + 1}{x^2 - 5}$
- $f(x) = 4 - \frac{3}{x + 1}$
- $f(x) = 5x^3 - 4x$

Asymptotes and Graphs

Exercises 13–18: Identify any horizontal or vertical asymptotes in the graph. State the domain of f .

15.

16.

17.

18.

Exercises 19 and 20: In the table, Y_1 is a rational function. Give a possible equation for a horizontal asymptote.

19.

X	Y_1
50	2.8654
100	2.9314
150	2.9539
200	2.9653
250	2.9722
300	2.9768
350	2.9801

$X = 50$

20.

X	Y_1
-10	4.8922
-20	4.9726
-30	4.9878
-40	4.9931
-50	4.9956
-60	4.9969
-70	4.9978

$X = -10$

Exercises 21–32: Find any horizontal or vertical asymptotes.

21. $f(x) = \frac{4x + 1}{2x - 6}$

22. $f(x) = \frac{x + 6}{5 - 2x}$

23. $f(x) = \frac{3}{x^2 - 5}$

24. $f(x) = \frac{3x^2}{x^2 - 9}$

25. $f(x) = \frac{x^4 + 1}{x^2 + 3x - 10}$

26. $f(x) = \frac{4x^3 - 2}{x + 2}$

27. $f(x) = \frac{x^2 + 2x + 1}{2x^2 - 3x - 5}$

28. $f(x) = \frac{6x^2 - x - 2}{2x^2 + x - 6}$

29. $f(x) = \frac{3x(x + 2)}{(x + 2)(x - 1)}$

30. $f(x) = \frac{x}{x^3 - x}$

31. $f(x) = \frac{x^2 - 9}{x + 3}$

32. $f(x) = \frac{2x^2 - 3x + 1}{2x - 1}$

Exercises 33–36: Let a be a positive constant. Match $f(x)$ with its graph (a–d) without using a calculator.

33. $f(x) = \frac{a}{x - 1}$

34. $f(x) = \frac{2x + a}{x - 1}$

35. $f(x) = \frac{x - a}{x + 2}$

36. $f(x) = \frac{-2x}{x^2 - a}$

Exercises 37–40: Write a formula $f(x)$ for a rational function so that its graph has the specified asymptotes.

37. Vertical: $x = -3$; horizontal: $y = 1$

38. Vertical: $x = 4$; horizontal: $y = -3$

39. Vertical: $x = \pm 3$; horizontal: $y = 0$

40. Vertical: $x = -2$ and $x = 4$; horizontal: $y = 5$

Graphing Rational Functions

Exercises 41–44: Graph f and identify any asymptotes.

41. $f(x) = \frac{1}{x^2}$

42. $f(x) = -\frac{1}{x}$

43. $f(x) = -\frac{1}{2x}$

44. $f(x) = \frac{2}{x^2}$

Exercises 45–54: **Transformations** Use transformations of the graph of either $f(x) = \frac{1}{x}$ or $h(x) = \frac{1}{x^2}$ to sketch a graph of $y = g(x)$ by hand. Show all asymptotes. Write $g(x)$ in terms of either $f(x)$ or $h(x)$.

45. $g(x) = \frac{1}{x - 3}$

46. $g(x) = \frac{1}{x + 2}$

47. $g(x) = \frac{1}{x} + 2$

48. $g(x) = 1 - \frac{2}{x}$

49. $g(x) = \frac{1}{x + 1} - 2$

50. $g(x) = \frac{1}{x - 2} + 1$

51. $g(x) = -\frac{2}{(x - 1)^2}$

52. $g(x) = \frac{1}{x^2} - 1$

53. $g(x) = \frac{1}{(x + 1)^2} - 2$

54. $g(x) = 1 - \frac{1}{(x - 2)^2}$

Exercises 55–62: Complete the following.

(a) Find the domain of f .

(b) Graph f in an appropriate viewing rectangle.

(c) Find any horizontal or vertical asymptotes.

(d) Sketch a graph of f that includes any asymptotes.

55. $f(x) = \frac{x + 3}{x - 2}$

56. $f(x) = \frac{6 - 2x}{x + 3}$

57. $f(x) = \frac{4x + 1}{x^2 - 4}$

58. $f(x) = \frac{0.5x^2 + 1}{x^2 - 9}$

59. $f(x) = \frac{4}{1 - 0.25x^2}$

60. $f(x) = \frac{x^2}{1 + 0.25x^2}$

61. $f(x) = \frac{x^2 - 4}{x - 2}$

62. $f(x) = \frac{4(x - 1)}{x^2 - x - 6}$

Exercises 63–72: Graph $y = f(x)$. You may want to use division, factoring, or transformations as an aid. Show all asymptotes and “holes.”

63. $f(x) = \frac{x^2 - 2x + 1}{x - 1}$

64. $f(x) = \frac{4x^2 + 4x + 1}{2x + 1}$

65. $f(x) = \frac{x+2}{x+1}$

66. $f(x) = \frac{2x+3}{x+1}$

67. $f(x) = \frac{2x^2 - 3x - 2}{x^2 - 4x + 4}$

68. $f(x) = \frac{x^2 - x - 2}{x^2 - 2x - 3}$

69. $f(x) = \frac{2x^2 + 9x + 9}{2x^2 + 7x + 6}$

70. $f(x) = \frac{x^2 - 4}{x^2 - x - 6}$

71. $f(x) = \frac{-2x^2 + 11x - 14}{x^2 - 5x + 6}$

72. $f(x) = \frac{2x^2 - 3x - 14}{x^2 - 2x - 8}$

Slant Asymptotes

Exercises 73–80: Complete the following.

(a) Find any slant or vertical asymptotes.

(b) Graph $y = f(x)$. Show all asymptotes.

73. $f(x) = \frac{x^2 + 1}{x + 1}$

74. $f(x) = \frac{2x^2 - 5x - 2}{x - 2}$

75. $f(x) = \frac{0.5x^2 - 2x + 2}{x + 2}$

76. $f(x) = \frac{0.5x^2 - 5}{x - 3}$

77. $f(x) = \frac{x^2 + 2x + 1}{x - 1}$

78. $f(x) = \frac{2x^2 + 3x + 1}{x - 2}$

79. $f(x) = \frac{4x^2}{2x - 1}$

80. $f(x) = \frac{4x^2 + x - 2}{4x - 3}$

Basic Rational Equations

Exercises 81–86: Solve the equation.

81. $\frac{4}{x+2} = -4$

82. $\frac{3}{2x+1} = -1$

83. $\frac{x+1}{x} = 2$

84. $\frac{2x}{x-3} = -4$

85. $\frac{1-x}{3x-1} = -\frac{3}{5}$

86. $\frac{3-2x}{x+2} = 12$

Graphing Rational Functions by Hand

Exercises 87–92: (Refer to Examples 9 and 10.) Graph f . Use the steps for graphing a rational function described in this section.

87. $f(x) = \frac{2x-4}{x-1}$

88. $f(x) = \frac{x+3}{2x-4}$

89. $f(x) = \frac{x^2 - 2x}{x^2 + 6x + 9}$

90. $f(x) = \frac{2x+1}{x^2 + 6x + 8}$

91. $f(x) = \frac{x^2 + 2x + 1}{x^2 - x - 6}$

92. $f(x) = \frac{3x^2 + 3x - 6}{x^2 - x - 12}$

Applications

93. **Time Spent in Line** If two parking attendants can wait on 8 vehicles per minute and vehicles are leaving the parking garage randomly at an average rate of x vehicles per minute, then the average time T in minutes spent waiting in line and paying the attendant is given by the formula $T(x) = -\frac{1}{x-8}$, where $0 \leq x < 8$. A graph of T is shown in the figure.

- (a) Evaluate $T(4)$ and $T(7.5)$. Interpret the results.
- (b) What happens to the wait as vehicles arrive at an average rate that approaches 8 cars per minute?
94. **Time Spent in Line** (Refer to Exercise 93.) If the parking attendants can wait on 5 vehicles per minute, the average time T in minutes spent waiting in line and paying the attendant becomes $T(x) = -\frac{1}{x-5}$.
- (a) What is a reasonable domain for T ?
- (b) Graph $y = T(x)$. Include any vertical asymptotes.
- (c) Explain what happens to $T(x)$ as $x \rightarrow 5^-$.
95. **Length of Lines** (Refer to Example 2.) Suppose that a parking attendant can wait on 40 cars per hour and that cars arrive randomly at a rate of x cars per hour. Then the average number of cars waiting in line can be estimated by

$$N(x) = \frac{x^2}{1600 - 40x}$$

- (a) Evaluate $N(20)$ and $N(39)$.
- (b) Explain what happens to the length of the line as x approaches 40.
- (c) Find any vertical asymptotes of the graph of N .

96. **Construction Zone** Suppose that a construction zone can allow 50 cars per hour to pass through and that cars arrive randomly at a rate of x cars per hour. Then the average number of cars waiting in line to get through the construction zone can be estimated by

$$N(x) = \frac{x^2}{2500 - 50x}.$$

- (a) Evaluate $N(20)$, $N(40)$, and $N(49)$.
- (b) Explain what happens to the length of the line as x approaches 50.
- (c) Find any vertical asymptotes of the graph of N .
97. **Interpreting an Asymptote** Suppose that an insect population in millions is modeled by $f(x) = \frac{10x + 1}{x + 1}$, where $x \geq 0$ is in months.
-  (a) Graph f in $[0, 14, 1]$ by $[0, 14, 1]$. Find the equation of the horizontal asymptote.
- (b) Determine the initial insect population.
- (c) What happens to the population over time?
- (d) Interpret the horizontal asymptote.
98. **Interpreting an Asymptote** Suppose that the population of a species of fish (in thousands) is modeled by $f(x) = \frac{x + 10}{0.5x^2 + 1}$, where $x \geq 0$ is in years.
-  (a) Graph f in $[0, 12, 1]$ by $[0, 12, 1]$. What is the horizontal asymptote?
- (b) Determine the initial population.
- (c) What happens to the population of this fish?
- (d) Interpret the horizontal asymptote.
99. **Train Curves** When curves are designed for trains, sometimes the outer rail is elevated or banked, so that a locomotive can safely negotiate the curve at a higher speed. See the figure. Suppose a circular curve is designed for 60 miles per hour. The formula $f(x) = \frac{2540}{x}$ computes the elevation y in inches of the outer track for a curve having a radius of x feet, where $y = f(x)$. (Source: L. Haefner, *Introduction to Transportation Systems*.)

- (a) Evaluate $f(400)$ and interpret the result.
- (b) Graph f in $[0, 600, 100]$ by $[0, 50, 5]$. How does the elevation change as the radius increases?
- (c) Interpret the horizontal asymptote.
- (d) Find the radius if the elevation is 12.7 inches.
100. **Probability** A container holds x balls numbered 1 through x . Only one ball has the winning number.
- (a) Find a function f that computes the probability, or likelihood, of *not* drawing the winning ball.
- (b) What is the domain of f ?
- (c) What happens to the probability of *not* drawing the winning ball as the number of balls increases?
- (d) Interpret the horizontal asymptote of the graph of f .
101. **Slippery Roads** If a car is moving at 50 miles per hour on a level highway, then its braking distance depends on the road conditions. This distance in feet can be computed by $D(x) = \frac{2500}{30x}$, where x is the coefficient of friction between the tires and the road and $0 < x \leq 1$. A smaller value of x indicates that the road is more slippery.
- (a) Identify and interpret the vertical asymptote.
- (b) Estimate the coefficient of friction associated with a braking distance of 340 feet.
102. **Concentration of a Drug** The concentration of a drug in a medical patient's bloodstream is given by the formula $f(t) = \frac{5}{t^2 + 1}$, where the input t is in hours, $t \geq 0$, and the output is in milligrams per liter.
- (a) Does the concentration of the drug increase or decrease? Explain.
- (b) The patient should not take a second dose until the concentration is below 1.5 milligrams per liter. How long should the patient wait before taking a second dose?

Writing about Mathematics

103. Let $f(x)$ be the formula for a rational function.
- (a) Explain how to find any vertical or horizontal asymptotes of the graph of f .
- (b) Discuss what a horizontal asymptote represents.
104. Discuss how to find the domain of a rational function symbolically and graphically.

EXTENDED AND DISCOVERY EXERCISES

Exercises 1–4: **Rate of Change/Difference Quotient** Find the average rate of change of f from $x_1 = 1$ to $x_2 = 3$. Then find the difference quotient of f .

1. $f(x) = \frac{1}{x}$

2. $f(x) = \frac{1}{x^2}$

3. $f(x) = \frac{3}{2x}$

4. $f(x) = \frac{1}{5-x}$

CHECKING BASIC CONCEPTS FOR SECTIONS 4.5 AND 4.6

- Find a quadratic polynomial $f(x)$ with zeros $\pm 4i$ and leading coefficient 3. Write $f(x)$ in complete factored form and expanded form.
- Sketch a graph of a quartic function (degree 4) with a negative leading coefficient, two real zeros, and two imaginary zeros.
- Write $x^3 - x^2 + 4x - 4$ in complete factored form.
- Solve each equation.
 - $2x^3 + 45 = 5x^2 - 18x$
 - $x^4 + 5x^2 = 36$
- Let $f(x) = \frac{1}{x-1} + 2$.
 - Find the domain of f .
 - Identify any vertical or horizontal asymptotes.
 - Sketch a graph of f that includes all asymptotes.
- Find any vertical or horizontal asymptotes for the graph of $f(x) = \frac{4x^2}{x^2 - 4}$. State the domain of f .
- Sketch a graph of each rational function f . Include all asymptotes and any “holes” in your graph.
 - $f(x) = \frac{3x-1}{2x-2}$
 - $f(x) = \frac{1}{(x+1)^2}$
 - $f(x) = \frac{x+2}{x^2-4}$
 - $f(x) = \frac{x^2+1}{x^2-1}$

4.7 More Equations and Inequalities

- Solve rational equations
- Solve variation problems
- Solve polynomial inequalities
- Solve rational inequalities

Introduction

Waiting in line has become part of almost everyone's life. When people arrive randomly at a line, rational functions can be used to estimate the average number of people standing in line. For example, if an attendant at a ticket booth can wait on 30 customers per hour and if customers arrive at an average rate of x per hour, then the average number of customers waiting in line is computed by

$$f(x) = \frac{x^2}{900 - 30x},$$

where $0 \leq x < 30$. Thus $f(28) \approx 13$ indicates that if customers arrive, on average, at 28 per hour, then the average number of people in line is 13. If a line length of 8 customers or fewer is acceptable, then we can use $f(x)$ to estimate customer arrival rates x that one attendant can accommodate by solving the *rational inequality*

$$\frac{x^2}{900 - 30x} \leq 8.$$

(See Example 8.) Rational inequalities are discussed in this section along with other types of inequalities and equations. (Source: N. Garber and L. Hoel, *Traffic and Highway Engineering*.)

Rational Equations

If $f(x)$ represents a rational function, then an equation that can be written in the form $f(x) = k$ for some constant k is a **rational equation**. Examples of rational equations include

$$\frac{x^2 - 1}{x^2 + x + 3} = 0, \quad \frac{-3x}{x^3 + x} = \frac{3}{2}, \quad \text{and} \quad \frac{2}{x - 1} + \frac{1}{x} = -2.$$

An Application The rational expression given by $D(x) = \frac{2500}{30(0.3 + x)}$ calculates the stopping distance for a car traveling downhill at 50 miles per hour, where x is the **grade**, or slope, of the hill with $x < 0$. The solution to the rational equation $\frac{2500}{30(0.3 + x)} = 220$ gives the slope of a hill when the stopping distance equals 220 feet. (See Exercise 83.)

Rational equations can be solved symbolically, graphically, and numerically.

EXAMPLE 1 Solving a rational equation

Solve $\frac{4x}{x - 1} = 6$ symbolically, graphically, and numerically.

SOLUTION

Getting Started The equation $\frac{a}{b} = \frac{c}{d}$ with $b \neq 0$ and $d \neq 0$ is equivalent to $ad = bc$. In this example, you can think of 6 as the ratio $\frac{6}{1}$. This technique is sometimes called *cross multiplying*. ▶

Symbolic Solution	$\frac{4x}{x - 1} = 6$	Given equation
	$4x = 6(x - 1)$	Cross multiply: $\frac{a}{b} = \frac{c}{d}$ implies $ad = bc$.
	$4x = 6x - 6$	Distributive property
	$-2x = -6$	Subtract $6x$.
	$x = 3$	Divide by -2 . (Check this answer.)

Graphical Solution Graph $Y_1 = 4X/(X - 1)$ and $Y_2 = 6$. Their graphs intersect at (3, 6), so the solution is 3. See Figure 4.96.

[-9.4, 9.4, 1] by [-9.4, 9.4, 1]

Numerical Solution In Figure 4.97, $y_1 = y_2$ when $x = 3$.

Now Try Exercise 1 ◀

Algebra Review

To review clearing fractions, see Chapter R (page R-35).

A common approach to solving rational equations symbolically is to multiply each side of the equation by a common denominator. This technique, which clears fractions from an equation, is used in Examples 2 and 3.

EXAMPLE 2 Solving a rational equation

Solve $\frac{6}{x^2} - \frac{5}{x} = 1$ symbolically.

SOLUTION The least common denominator for x^2 and x is x^2 . Multiply each side of the equation by x^2 .

$$\frac{6}{x^2} - \frac{5}{x} = 1$$

Given equation

$$\frac{6}{x^2} \cdot x^2 - \frac{5}{x} \cdot x^2 = 1 \cdot x^2$$

Multiply each term by x^2 .

$$6 - 5x = x^2$$

Simplify.

$$0 = x^2 + 5x - 6$$

Add $5x$ and subtract 6 .

$$0 = (x + 6)(x - 1)$$

Factor.

$$x + 6 = 0 \quad \text{or} \quad x - 1 = 0$$

Zero-product property

$$x = -6 \quad \text{or} \quad x = 1$$

Solve.

Check to verify that each answer is correct.

Now Try Exercise 17 ◀

The next example illustrates the importance of checking possible solutions.

EXAMPLE 3 Solving a rational equation

Solve $\frac{1}{x+3} + \frac{1}{x-3} = \frac{6}{x^2-9}$ symbolically. Check the result.

SOLUTION The least common denominator is $(x+3)(x-3)$, or x^2-9 .

$$\frac{1}{x+3} + \frac{1}{x-3} = \frac{6}{x^2-9}$$

Given equation

$$\frac{(x+3)(x-3)}{x+3} + \frac{(x+3)(x-3)}{x-3} = \frac{6(x+3)(x-3)}{x^2-9}$$

Multiply by $(x+3)(x-3)$.

$$(x-3) + (x+3) = 6$$

Simplify.

$$2x = 6$$

Combine terms.

$$x = 3$$

Divide by 2.

When 3 is substituted for x , two expressions in the *given* equation are undefined. There are no solutions. (The value 3 is called an **extraneous solution** because it does not satisfy the given equation.)

Now Try Exercise 21 ◀

An Application Rational equations are used in real-world applications such as the construction problem in the next example. Steps for solving application problems (see page 122) have been used to structure the solution.

EXAMPLE 4 Designing a box

A box with rectangular sides and a top is being designed to hold 324 cubic inches and to have a surface area of 342 square inches. If the length of the box is four times the height, find possible dimensions of the box.

Algebra Review

To review finding a least common denominator, see Chapter R (page R-32).

SOLUTION

STEP 1: We are asked to find the dimensions of a box. If x is the height of the box and y is the width, then the length of the box is $4x$, or four times the height.

x : Height of the box y : Width of the box $4x$: Length of the box

Figure 4.98

STEP 2: To relate these variables to an equation, sketch a box as illustrated in Figure 4.98. The volume V of the box is height times width times length.

$$V = xy(4x) = 4x^2y$$

The surface area A of this box is determined by finding the area of the 6 rectangular sides: left and right sides, front and back, and top and bottom.

$$\begin{aligned} A &= 2(4x \cdot x) + 2(x \cdot y) + 2(4x \cdot y) \\ &= 8x^2 + 10xy \end{aligned}$$

If we solve $V = 4x^2y$ for y and let $V = 324$, we obtain

$$y = \frac{V}{4x^2} = \frac{324}{4x^2} = \frac{81}{x^2}.$$

Substituting $y = \frac{81}{x^2}$ in the formula for A eliminates the y variable.

$$\begin{aligned} A &= 8x^2 + 10xy && \text{Area formula} \\ &= 8x^2 + 10x \cdot \frac{81}{x^2} && \text{Let } y = \frac{81}{x^2}. \\ &= 8x^2 + \frac{810}{x} && \text{Simplify.} \end{aligned}$$

Since the surface area is $A = 342$ square inches, the height x can be determined by solving the rational equation

$$8x^2 + \frac{810}{x} = 342.$$

STEP 3: Figures 4.99 and 4.100 show the graphs of $Y_1 = 8X^2 + 810/X$ and $Y_2 = 342$. There are two positive solutions: $x = 3$ and $x = 4.5$.

Figure 4.99

Figure 4.100

Calculator Help

To find a point of intersection, see Appendix A (page AP-8).

NOTE This equation can be written as $8x^3 - 342x + 810 = 0$, and the rational zeros test or factoring could be used to find the solutions, 3 and $\frac{9}{2}$.

If the height is $x = 3$ inches, then the length is $4 \cdot 3 = 12$ inches and the width is $y = \frac{81}{3^2} = 9$ inches. (Note that $y = \frac{81}{x^2}$.) If the height is 4.5 inches, then

the length is $4 \cdot 4.5 = 18$ inches and the width is $y = \frac{81}{4.5^2} = 4$ inches. Thus the dimensions of the box in inches can be either $3 \times 9 \times 12$ or $4.5 \times 4 \times 18$.

STEP 4: We can check our results directly. If the dimensions are $3 \times 9 \times 12$, then

$$V = 3 \cdot 9 \cdot 12 = 324 \quad \text{and}$$

$$S = 2(3 \cdot 9) + 2(3 \cdot 12) + 2(9 \cdot 12) = 342.$$

If the dimensions are $4.5 \times 4 \times 18$, then

$$V = 4.5 \cdot 4 \cdot 18 = 324 \quad \text{and}$$

$$S = 2(4.5 \cdot 4) + 2(4.5 \cdot 18) + 2(4 \cdot 18) = 342.$$

In both cases our results check.

Now Try Exercise 79 ◀

Variation

Direct Variation as the n th Power In Section 2.2 direct variation was discussed. Sometimes a quantity y varies directly as a *power* of a variable. For example, the area A of a circle varies directly as the second power of the radius r . That is, $A = \pi r^2$.

Direct Variation as the n th Power

Let x and y denote two quantities and n be a positive number. Then y is **directly proportional to the n th power** of x , or y **varies directly as the n th power** of x , if there exists a nonzero number k such that

$$y = kx^n.$$

The number k is called the *constant of variation* or the *constant of proportionality*. In the formula $A = \pi r^2$, the constant of variation is π .

EXAMPLE 5 Modeling a pendulum

The time T required for a pendulum to swing back and forth once is called its *period*. The length L of a pendulum is directly proportional to the square of T . See Figure 4.101. A 2-foot pendulum has a 1.57-second period.

- Find the constant of proportionality k .
- Predict T for a pendulum having a length of 5 feet.

SOLUTION

- Because L is directly proportional to the square of T , we can write $L = kT^2$. If $L = 2$, then $T = 1.57$. Thus $k = \frac{L}{T^2} = \frac{2}{1.57^2} \approx 0.81$ and $L = 0.81T^2$.
- If $L = 5$, then $5 = 0.81T^2$. It follows that $T = \sqrt{5/0.81} \approx 2.48$ seconds.

Now Try Exercise 107 ◀

Figure 4.101

Inverse Variation as the n th Power When two quantities vary inversely, an increase in one quantity results in a decrease in the second quantity. For example, it takes 4 hours to travel 100 miles at 25 miles per hour and 2 hours to travel 100 miles at 50 miles per hour. Greater speed results in less travel time. If s represents the average speed of a car and t is the time to travel 100 miles, then $s \cdot t = 100$, or $t = \frac{100}{s}$. Doubling the speed cuts the time in half; tripling the speed reduces the time by one-third. The quantities t and s are said to *vary inversely*. The constant of variation is 100.

Inverse Variation as the n th Power

Let x and y denote two quantities and n be a positive number. Then y is **inversely proportional to the n th power of x** , or y **varies inversely as the n th power of x** , if there exists a nonzero number k such that

$$y = \frac{k}{x^n}.$$

If $y = \frac{k}{x}$, then y is **inversely proportional to x** or y **varies inversely as x** .

NOTE To review steps for solving variation problems see the box on page 105.

Inverse variation occurs in measuring the intensity of light. If we increase our distance from a lightbulb, the intensity of the light decreases. Intensity I is inversely proportional to the second power of the distance d . The equation $I = \frac{k}{d^2}$ models this phenomenon.

EXAMPLE Modeling the intensity of light

At a distance of 3 meters, a 100-watt bulb produces an intensity of 0.88 watt per square meter. (Source: R. Weidner and R. Sells, *Elementary Classical Physics*, Volume 2.)

- Find the constant of proportionality k .
- Determine the intensity at a distance of 2 meters.

SOLUTION

- Substitute $d = 3$ and $I = 0.88$ in the equation $I = \frac{k}{d^2}$. Solve for k .

$$0.88 = \frac{k}{3^2}, \quad \text{or} \quad k = 7.92$$

- Let $I = \frac{7.92}{d^2}$ and $d = 2$. Then $I = \frac{7.92}{2^2} = 1.98$. The intensity at 2 meters is 1.98 watts per square meter.

Now Try Exercise 111 ◀

Polynomial Inequalities

Graphical Solutions In Section 3.4 a strategy for solving quadratic inequalities was presented. This strategy involves first finding boundary numbers (x -values) where equality holds. Once the boundary numbers are known, a graph or a table of test values can be used to determine the intervals where inequality holds. This strategy can be applied to other types of inequalities.

For example, consider the inequality $p(x) > 0$, where $p(x) = -x^4 + 5x^2 - 4$. The graph of p is shown in Figure 4.102. The boundary numbers are -2 , -1 , 1 , and 2 and are shown in the graph and on the number line above it. The solution set to the inequality $p(x) > 0$ can be written in interval notation as $(-2, -1) \cup (1, 2)$ and corresponds to where the graph is above the x -axis. (The symbol \cup means union and indicates that x can be in either interval.) The intervals $(-2, -1)$ and $(1, 2)$ are shaded green on the x -axis in Figure 4.103 and on the number line above it.

Similarly, the solution set to the inequality $p(x) < 0$ is $(-\infty, -2) \cup (-1, 1) \cup (2, \infty)$ and corresponds to where the graph of $y = p(x)$ is below the x -axis. These intervals are shaded red on the x -axis in Figure 4.104 and on the number line above it.

Algebra Review

To review interval notation, see Section 1.5.

Figure 4.102

Figure 4.103

Figure 4.104

MAKING CONNECTIONS

Visualization and Inequalities A precise graph of p is not necessary to solve the polynomial inequality $p(x) > 0$ or $p(x) < 0$. Once the x -intercepts have been determined, we can use our knowledge about graphs of quartic polynomials (see Section 4.2) to visualize the M-shaped graph of p shown in Figure 4.102. We need to make only a rough sketch and then determine where the graph of p is above the x -axis and where it is below the x -axis.

Symbolic Solutions Polynomial inequalities can also be solved symbolically. For example, to solve the inequality $-x^4 + 5x^2 - 4 > 0$, begin by finding the boundary numbers.

$$-x^4 + 5x^2 - 4 = 0 \quad \text{Replace } > \text{ with } =.$$

$$x^4 - 5x^2 + 4 = 0 \quad \text{Multiply by } -1.$$

$$(x^2 - 4)(x^2 - 1) = 0 \quad \text{Factor.}$$

$$x^2 - 4 = 0 \quad \text{or} \quad x^2 - 1 = 0 \quad \text{Zero-product property}$$

$$x = \pm 2 \quad \text{or} \quad x = \pm 1 \quad \text{Square root property}$$

The boundary numbers -2 , -1 , 1 , and 2 separate the number line into five intervals:

$$(-\infty, -2), (-2, -1), (-1, 1), (1, 2), \text{ and } (2, \infty),$$

as illustrated in Figure 4.105.

The polynomial $p(x) = -x^4 + 5x^2 - 4$ is either always positive or always negative on each of these intervals. To determine which is the case, we can choose one test value (x -value) from each interval and substitute this test value in $p(x)$. From Table 4.6 on the next page we see that the test value $x = -1.5$ results in

$$p(-1.5) = -(-1.5)^4 + 5(-1.5)^2 - 4 = 2.1875 > 0.$$

Figure 4.106 on the next page, which was created by a graphing calculator, is similar to Table 4.6. Since $x = -1.5$ is in the interval $(-2, -1)$, it follows that $p(x)$ is positive on this interval. The sign of $p(x)$ on the other intervals is determined similarly. Thus the solution set to $p(x) = -x^4 + 5x^2 - 4 > 0$ is $(-2, -1) \cup (1, 2)$, which is consistent with the graphical solution in Figure 4.103.

Figure 4.105

X	Y
-3	-40
-1.5	2.1875
0	-4
1.5	2.1875
3	-40

$Y_1 = -X^4 + 5X^2 - 4$

Figure 4.106

Table 4.6

Interval	Test Value x	$-x^4 + 5x^2 - 4$	Positive or Negative?
$(-\infty, -2)$	-3	-40	Negative
$(-2, -1)$	-1.5	2.1875	Positive
$(-1, 1)$	0	-4	Negative
$(1, 2)$	1.5	2.1875	Positive
$(2, \infty)$	3	-40	Negative

These symbolic and graphical procedures can be summarized verbally as follows.

Solving Polynomial Inequalities

- STEP 1:** If necessary, write the inequality as $p(x) < 0$, where $p(x)$ is a polynomial and the inequality symbol $<$ may be replaced by $>$, \leq , or \geq .
- STEP 2:** Solve $p(x) = 0$. The solutions are called boundary numbers.
- STEP 3:** Use the boundary numbers to separate the number line into disjoint intervals. On each interval, $p(x)$ is either always positive or always negative.
- STEP 4:** To solve the inequality, either make a table of test values for $p(x)$ or use a graph of $y = p(x)$. For example, the solution set for $p(x) < 0$ corresponds to intervals where test values result in negative outputs or to intervals where the graph of $y = p(x)$ is below the x -axis.

EXAMPLE 7 Solving a polynomial inequality

Solve $x^3 \geq 2x^2 + 3x$ symbolically and graphically.

SOLUTION

Symbolic Solution

STEP 1: Begin by writing the inequality as $x^3 - 2x^2 - 3x \geq 0$.

STEP 2: Replace the \geq symbol with an equals sign and solve the resulting equation.

$$x^3 - 2x^2 - 3x = 0 \quad \text{Replace } \geq \text{ with } =.$$

$$x(x^2 - 2x - 3) = 0 \quad \text{Factor out } x.$$

$$x(x + 1)(x - 3) = 0 \quad \text{Factor the trinomial.}$$

$$x = 0 \quad \text{or} \quad x = -1 \quad \text{or} \quad x = 3 \quad \text{Zero-product property}$$

The boundary numbers are -1 , 0 , and 3 .

STEP 3: The boundary numbers separate the number line into four disjoint intervals:

$$(-\infty, -1), (-1, 0), (0, 3), \text{ and } (3, \infty),$$

as illustrated in Figure 4.107.

STEP 4: In Table 4.7 the expression $x^3 - 2x^2 - 3x$ is evaluated at a test value from each interval. The solution set is $[-1, 0] \cup [3, \infty)$. In Figure 4.108 a graphing calculator has been used to evaluate the same test values. (Note: The boundary numbers are included in the solution set because the inequality involves \geq rather than $>$.)

Algebra Review

To review factoring, see Chapter R, (page R-20).

Figure 4.107

X	Y ₁
-2	-10
-1.5	-8.875
-1	-4
0	0
1	-2
2	-10

Y₁ = $X^3 - 2X^2 - 3X$

Figure 4.108

[-5, 5, 1] by [-7, 7, 1]

Figure 4.109

Table 4.7

Interval	Test Value x	$x^3 - 2x^2 - 3x$	Positive or Negative?
$(-\infty, -1)$	-2	-10	Negative
$(-1, 0)$	-0.5	0.875	Positive
$(0, 3)$	1	-4	Negative
$(3, \infty)$	4	20	Positive

Graphical Solution Graph $Y_1 = X^3 - 2X^2 - 3X$, as shown in Figure 4.109. The zeros or x -intercepts are located at -1 , 0 , and 3 . The graph of y_1 is positive (or above the x -axis) for $-1 < x < 0$ or $3 < x < \infty$. If we include the boundary numbers, this result agrees with the symbolic solution.

Now Try Exercise 43

MAKING CONNECTIONS

Functions, Equations, and Inequalities The three concepts are related. For example,

$$f(x) = ax^3 + bx^2 + cx + d \quad \text{Cubic function}$$

$$ax^3 + bx^2 + cx + d = 0 \quad \text{Cubic equation}$$

$$ax^3 + bx^2 + cx + d < 0 \quad \text{Cubic inequality}$$

where $a \neq 0$. These concepts also apply to higher degree polynomials and to rational expressions.

Rational Inequalities

An Application In the introduction we looked at how a rational inequality can be used to estimate the number of people standing in line at a ticket booth. In the next example, this inequality is solved graphically.

EXAMPLE 8 Modeling customers in a line

A ticket booth attendant can wait on 30 customers per hour. To keep the time waiting in line reasonable, the line length should not exceed 8 customers on average. Solve the inequality $\frac{x^2}{900 - 30x} \leq 8$ to determine the rates x at which customers can arrive before a second attendant is needed. Note that the x -values are limited to $0 \leq x < 30$.

SOLUTION Graph $Y_1 = X^2/(900 - 30X)$ and $Y_2 = 8$ for $0 \leq x \leq 30$, as shown in Figure 4.110. The only point of intersection on this interval is near $(26.97, 8)$. The graph of y_1 is below the graph of y_2 for x -values to the left of this point. We conclude that if the arrival rate is about 27 customers per hour or less, then the line length does not exceed 8 customers on average. If the arrival rate is more than 27 customers per hour, a second ticket booth attendant is needed.

Now Try Exercise 85

[0, 30, 5] by [0, 10, 2]

Figure 4.110

Graphical and Symbolic Solutions To solve rational inequalities, we can use the same basic techniques that we used to solve polynomial inequalities, with one important modification: boundary numbers also occur at x -values where the denominator of any rational expression in the inequality equals 0. The following steps can be used to solve a rational inequality.

Solving Rational Inequalities

- STEP 1:** If necessary, write the inequality in the form $\frac{p(x)}{q(x)} > 0$, where $p(x)$ and $q(x)$ are polynomials. Note that $>$ may be replaced by $<$, \leq , or \geq .
- STEP 2:** Solve $p(x) = 0$ and $q(x) = 0$. The solutions are boundary numbers.
- STEP 3:** Use the boundary numbers to separate the number line into disjoint intervals. On each interval, $\frac{p(x)}{q(x)}$ is either always positive or always negative.
- STEP 4:** Use a table of test values or a graph to solve the inequality in Step 1.

EXAMPLE 9 Solving a rational inequality

Solve $\frac{2-x}{2x} > 0$ symbolically. Support your answer graphically.

SOLUTION

Symbolic Solution The inequality is written in the form $\frac{p(x)}{q(x)} > 0$, so Step 1 is unnecessary.

STEP 2: Set the numerator and the denominator equal to 0 and solve.

Numerator	Denominator
$2 - x = 0$	$2x = 0$
$x = 2$	$x = 0$

STEP 3: The boundary numbers are 0 and 2, which separate the number line into three disjoint intervals: $(-\infty, 0)$, $(0, 2)$, and $(2, \infty)$.

STEP 4: Table 4.8 shows that the expression is positive between the two boundary numbers or when $0 < x < 2$. In interval notation the solution set is $(0, 2)$.

Table 4.8

Interval	Test Value x	$(2 - x)/(2x)$	Positive or Negative?
$(-\infty, 0)$	-1	-1.5	Negative
$(0, 2)$	1	0.5	Positive
$(2, \infty)$	4	-0.25	Negative

Graphical Solution Graph $Y_1 = (2 - X)/(2X)$, as shown in Figure 4.111. The graph has a vertical asymptote at $x = 0$ and an x -intercept at $x = 2$. Between these boundary numbers the graph of y_1 is positive (or above the x -axis). The solution set is $(0, 2)$. This agrees with our symbolic solution.

Now Try Exercise 59 ◀

$[-4.7, 4.7, 1]$ by $[-3.1, 3.1, 1]$

Figure 4.111

EXAMPLE 10 Solving a rational inequality symbolically

Solve $\frac{1}{x} \leq \frac{2}{x+1}$.

SOLUTION

STEP 1: Begin by writing the inequality in the form $\frac{p(x)}{q(x)} \leq 0$.

$$\frac{1}{x} - \frac{2}{x+1} \leq 0 \quad \text{Subtract } \frac{2}{x+1} \text{ from both sides.}$$

Algebra Review

To review subtraction of rational expressions, see Chapter R (page R-34).

$$\frac{1}{x} \cdot \frac{(x+1)}{(x+1)} - \frac{2}{x+1} \cdot \frac{x}{x} \leq 0 \quad \text{Common denominator is } x(x+1).$$

$$\frac{x+1}{x(x+1)} - \frac{2x}{x(x+1)} \leq 0 \quad \text{Multiply.}$$

$$\frac{1-x}{x(x+1)} \leq 0 \quad \begin{array}{l} \text{Subtract numerators:} \\ x+1-2x = 1-x. \end{array}$$

STEP 2: Find the zeros of the numerator and the denominator.

<i>Numerator</i>	<i>Denominator</i>
$1 - x = 0$	$x(x + 1) = 0$
$x = 1$	$x = 0 \quad \text{or} \quad x = -1$

STEP 3: The boundary numbers are -1 , 0 , and 1 , which separate the number line into four disjoint intervals: $(-\infty, -1)$, $(-1, 0)$, $(0, 1)$, and $(1, \infty)$.

STEP 4: Table 4.9 can be used to solve the inequality $\frac{1-x}{x(x+1)} \leq 0$. The solution set is $(-1, 0) \cup [1, \infty)$. (Note: The boundary numbers -1 and 0 are not included in the solution set because the given inequality is undefined when $x = -1$ or $x = 0$.)

Table 4.9

Interval	Test Value x	$(1-x)/(x(x+1))$	Positive or Negative?
$(-\infty, -1)$	-2	1.5	Positive
$(-1, 0)$	-0.5	-6	Negative
$(0, 1)$	0.5	$0.\bar{6}$	Positive
$(1, \infty)$	2	$-0.1\bar{6}$	Negative

Now Try Exercise 75 ◀

Multiplying an Inequality by a Variable When solving a rational inequality, it is essential *not* to multiply or divide each side of the inequality by the LCD (least common denominator) if the LCD contains a *variable*. This technique often leads to an incorrect solution set.

For example, if each side of the rational inequality

$$\frac{1}{x} < 2$$

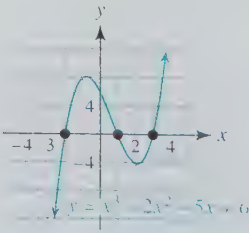

is multiplied by x to clear fractions, the inequality becomes

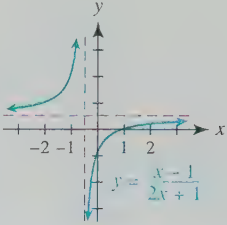

$$1 < 2x \text{ or } x > \frac{1}{2}.$$

However, this solution set is clearly incomplete because $x = -1$ is also a solution to the given inequality. In general, the variable x can be either negative or positive. If $x < 0$, the inequality symbol should be reversed, whereas if $x > 0$, the inequality symbol should not be reversed. Because we have no way of knowing ahead of time which is the case, this technique of multiplying by a variable should be *avoided*.

4.7 Putting It All Together

The following table outlines basic concepts for this section.

Concept	Description
Rational equation	<p>Can be written as $f(x) = k$, where f is a rational function. To solve a rational equation, first clear fractions by multiplying each side by the LCD. <i>Check your answers.</i></p> <p>Example: Solve $\frac{1}{x} + \frac{1}{x+2} = \frac{1}{x(x+2)}$.</p> <p>Multiply each side of the equation by the LCD: $x(x+2)$.</p> $\frac{x(x+2)}{x} + \frac{x(x+2)}{x+2} = \frac{x(x+2)}{x(x+2)}$ $(x+2) + x = 1$ $x = -\frac{1}{2} \quad \text{It checks.}$
Variation	<p>y varies directly as the nth power of x: $y = kx^n$.</p> <p>Example: Let y vary directly as the cube (third power) of x. If the constant of variation is 5, then $y = 5x^3$.</p> <p>y varies inversely as the nth power of x: $y = \frac{k}{x^n}$.</p> <p>Example: Let y vary inversely as the square (second power) of x. If the constant of variation is 3, then $y = \frac{3}{x^2}$.</p>
Polynomial inequality	<p>Can be written as $p(x) < 0$, where $p(x)$ is a polynomial and $<$ may be replaced by $>$, \leq, or \geq.</p> <p>Examples: $x^3 - x \leq 0$, $2x^4 - 3x^2 \geq 5x + 1$</p>
Solving a polynomial inequality	<p>Follow the steps for solving a polynomial inequality presented on page 330. Either graphical or symbolic methods can be used.</p> <p>Example: A graph of $y = x^3 - 2x^2 - 5x + 6$ is shown. The boundary numbers are -2, 1, and 3. The solution set to $x^3 - 2x^2 - 5x + 6 > 0$ is $(-2, 1) \cup (3, \infty)$.</p> 

Concept	Description
Rational inequality	<p>Can be written as $\frac{p(x)}{q(x)} < 0$, where $p(x)$ and $q(x) \neq 0$ are polynomials and $<$ may be replaced by $>$, \leq, or \geq.</p> <p>Examples: $\frac{x-3}{x+2} \geq 0$, $2x - \frac{2}{x^2-1} > 5$</p>
Solving a rational inequality	<p>Follow the steps for solving a rational inequality presented on page 332. Either graphical or symbolic methods can be used.</p> <p>Example: A graph of $y = \frac{x-1}{2x+1}$ is shown. Boundary numbers occur where either the numerator or denominator equals zero: $x = 1$ or $x = -\frac{1}{2}$. The solution set to $\frac{x-1}{2x+1} < 0$ is $(-\frac{1}{2}, 1)$.</p>

Rational Equations

Exercises 1–6: Solve the rational equation

(a) symbolically,

 (b) graphically, and

(c) numerically.

1. $\frac{2x}{x+2} = 6$

2. $\frac{3x}{2x-1} = 3$

3. $2 - \frac{5}{x} + \frac{2}{x^2} = 0$

4. $\frac{1}{x^2} + \frac{1}{x} = 2$

5. $\frac{1}{x+1} + \frac{1}{x-1} = \frac{1}{x^2-1}$

6. $\frac{4}{x-2} = \frac{3}{x-1}$

Exercises 7–28: Find all real solutions. Check your results.

7. $\frac{x+1}{x-5} = 0$

8. $\frac{x-2}{x+3} = 1$

9. $\frac{6(1-2x)}{x-5} = 4$

10. $\frac{2}{5(2x+5)} + 3 = -1$

11. $\frac{1}{x+2} + \frac{1}{x} = 1$

12. $\frac{2x}{x-1} = 5 + \frac{2}{x-1}$

13. $\frac{1}{x} - \frac{2}{x^2} = 5$

14. $\frac{1}{x^2-2} = \frac{1}{x}$

15. $\frac{x^3-4x}{x^2+1} = 0$

$$16. \frac{1}{x+2} + \frac{1}{x+3} = \frac{2}{x^2 + 5x + 6}$$

$$17. \frac{35}{x^2} = \frac{4}{x} + 15$$

$$18. 6 - \frac{35}{x} + \frac{36}{x^2} = 0$$

$$19. \frac{x+5}{x+2} = \frac{x-4}{x-10}$$

$$20. \frac{x-1}{x+1} = \frac{x+3}{x-4}$$

$$21. \frac{1}{x-2} - \frac{2}{x-3} = \frac{-1}{x^2 - 5x + 6}$$

$$22. \frac{1}{x-1} + \frac{3}{x+1} = \frac{4}{x^2 - 1}$$

$$23. \frac{2}{x-1} + 1 = \frac{4}{x^2 - 1}$$

$$24. \frac{1}{x} + 2 = \frac{1}{x^2 + x}$$

$$25. \frac{1}{x+2} = \frac{4}{4-x^2} - 1$$

$$26. \frac{1}{x-3} + 1 = \frac{6}{x^2 - 9}$$

$$27. \frac{1}{x-1} + \frac{1}{x+1} = \frac{2}{x^2 - 1}$$

$$28. \frac{1}{2x+1} + \frac{1}{2x-1} = \frac{2}{4x^2 - 1}$$

Graphical Solutions to Inequalities

Exercises 29–34: Solve the equation and inequalities.

(a) $f(x) = 0$

(b) $f(x) > 0$

(c) $f(x) < 0$

Exercises 35–40: Complete the following.

(a) Identify where $f(x)$ is undefined or $f(x) = 0$.

(b) Solve $f(x) > 0$.

(c) Solve $f(x) < 0$.

Polynomial Inequalities

Exercises 41–46: Solve the polynomial inequality

(a) symbolically and (b) graphically.

41. $x^3 - x > 0$

42. $8x^3 < 27$

43. $x^3 + x^2 \geq 2x$

44. $2x^3 \leq 3x^2 + 5x$

45. $x^4 - 13x^2 + 36 < 0$ 46. $4x^4 - 5x^2 - 9 \geq 0$

Exercises 47–52: Solve the polynomial inequality.

47. $7x^4 > 14x^2$ 48. $3x^4 - 4x^2 < 7$

49. $(x - 1)(x - 2)(x + 2) \geq 0$

50. $-(x + 1)^2(x - 2) \geq 0$ 51. $2x^4 + 2x^3 \leq 12x^2$

52. $x^3 + 6x^2 + 9x > 0$

 Exercises 53–56: Solve the polynomial inequality graphically.

53. $x^3 - 7x^2 + 14x \leq 8$ 54. $2x^3 + 3x^2 - 3x < 2$

55. $3x^4 - 7x^3 - 2x^2 + 8x > 0$

56. $x^4 - 5x^3 \leq 5x^2 + 45x + 36$

Rational Inequalities

Exercises 57–62: Solve the rational inequality

(a) symbolically and (b) graphically.

57. $\frac{1}{x} < 0$ 58. $\frac{1}{x^2} > 0$

59. $\frac{4}{x + 3} \geq 0$ 60. $\frac{x - 1}{x + 1} < 0$

61. $\frac{5}{x^2 - 4} < 0$ 62. $\frac{x}{x^2 - 1} \geq 0$

Exercises 63–76: Solve the rational inequality.

63. $\frac{(x + 1)^2}{x - 2} \leq 0$ 64. $\frac{2x}{(x - 2)^2} > 0$

65. $\frac{3 - 2x}{1 + x} < 0$ 66. $\frac{x + 1}{4 - 2x} \geq 1$

67. $\frac{(x + 1)(x - 2)}{(x + 3)} < 0$ 68. $\frac{x(x - 3)}{x + 2} \geq 0$

69. $\frac{2x - 5}{x^2 - 1} \geq 0$ 70. $\frac{5 - x}{x^2 - x - 2} < 0$

71. $\frac{1}{x - 3} \leq \frac{5}{x - 3}$ 72. $\frac{3}{2 - x} > \frac{x}{2 + x}$

73. $2 - \frac{5}{x} + \frac{2}{x^2} \geq 0$ 74. $\frac{1}{x - 1} + \frac{1}{x + 1} > \frac{3}{4}$

75. $\frac{1}{x} \leq \frac{2}{x + 2}$ 76. $\frac{1}{x + 1} < \frac{1}{x} + 1$

Applications

77. **Time Spent in Line** Suppose the average number of vehicles arriving at the main gate of an amusement park is equal to 10 per minute, while the average number of vehicles being admitted through the gate per minute is equal to x . Then the average waiting time in minutes for each vehicle at the gate can be computed by $f(x) = \frac{x - 5}{x^2 - 10x}$, where $x > 10$. (Source: F. Mannering.)

- (a) Estimate the admittance rate x that results in an average wait of 15 seconds.
- (b) If one attendant can serve 5 vehicles per minute, how many attendants are needed to keep the average wait to 15 seconds or less?

78. **Length of Lines** (Refer to Example 2 in Section 4.6.) Determine the traffic intensity x when the average number of vehicles in line equals 3.

79. **Construction** Find possible dimensions for a box with a volume of 196 cubic inches, a surface area of 280 square inches, and a length that is twice the width.

80. **Minimizing Surface Area** An aluminum can is being designed to hold a volume of 100π cubic centimeters.

Geometry Review To review formulas for cylinders, see Chapter R (page R-4).

- (a) Find a formula for the volume V in terms of r and h .
- (b) Write a formula for a function S that calculates the outside surface area of the can in terms of only r . Evaluate $S(2)$ and interpret the result.
-  (c) Find the dimensions that result in the least amount of aluminum being used in its construction.

81. **Minimizing Cost** A cardboard box with no top and a square base is being constructed and must have a volume of 108 cubic inches. Let x be the length of a side of its base in inches.

- (a) Write a formula $A(x)$ that calculates the outside surface area in square feet of the box.
- (b) If cardboard costs \$0.10 per square foot, write a formula $C(x)$ that gives the cost in dollars of the cardboard in the box.
-  (c) Find the dimensions of the box that would minimize the cost of the cardboard.

82. **Cost-Benefit** A cost-benefit function C computes the cost in millions of dollars of implementing a city recycling project when x percent of the citizens participate, where $C(x) = \frac{1.2x}{100 - x}$.

 (a) Graph C in $[0, 100, 10]$ by $[0, 10, 1]$. Interpret the graph as x approaches 100.

- (b) If 75% participation is expected, determine the cost for the city.
- (c) The city plans to spend \$5 million on this recycling project. Estimate the percentage of participation that can be expected.

83. **Braking Distance** The grade x of a hill is a measure of its steepness. For example, if a road rises 10 feet for every 100 feet of horizontal distance, then it has an uphill grade of $x = \frac{10}{100}$, or 10%. See the figure. Grades are typically kept quite small—usually less than 10%. The braking distance D for a car traveling at 50 miles per hour on a wet uphill grade is given by the formula $D(x) = \frac{2500}{30(0.3 + x)}$. (Source: L. Haefner.)

- (a) Evaluate $D(0.05)$ and interpret the result.
- (b) Describe what happens to the braking distance as the hill becomes steeper. Does this agree with your driving experience?
- (c) Estimate the grade associated with a braking distance of 220 feet.
84. **Braking Distance** (Refer to Exercise 83.) If a car is traveling 50 miles per hour downhill, then the car's braking distance on a wet pavement is given by

$$D(x) = \frac{2500}{30(0.3 + x)},$$

where $x < 0$ for a downhill grade.

- (a) Evaluate $D(-0.1)$ and interpret the result.
- (b) What happens to the braking distance as the downhill grade becomes steeper? Does this agree with your driving experience?

- (c) The graph of D has a vertical asymptote at $x = -0.3$. Give the physical significance of this asymptote.

- (d) Estimate the grade associated with a braking distance of 350 feet.

85. **Waiting in Line** (Refer to Example 8.) A parking garage attendant can wait on 40 cars per hour. If cars arrive randomly at a rate of x cars per hour, then the average line length is given by

$$f(x) = \frac{x^2}{1600 - 40x},$$

where the x -values are limited to $0 \leq x < 40$.

- (a) Solve the inequality $f(x) \leq 8$.
- (b) Interpret your answer from part (a).
86. **Time Spent in Line** If a parking garage attendant can wait on 3 vehicles per minute and vehicles are leaving the ramp at x vehicles per minute, then the average wait in minutes for a car trying to exit is given by the formula $f(x) = \frac{1}{3 - x}$.
- (a) Solve the three-part inequality $5 \leq \frac{1}{3 - x} \leq 10$.
- (b) Interpret your result from part (a).

87. **Slippery Roads** The coefficient of friction x measures the friction between the tires of a car and the road, where $0 < x \leq 1$. A smaller value of x indicates that the road is more slippery. If a car is traveling at 60 miles per hour, then the braking distance D in feet is given by the formula $D(x) = \frac{120}{x}$.
- (a) What happens to the braking distance as the coefficient of friction becomes smaller?

- (b) Find values for the coefficient of friction x that correspond to a braking distance of 400 feet or more.

-  88. **Average Temperature** The monthly average high temperature in degrees Fahrenheit at Daytona Beach, Florida, can be approximated by

$$f(x) = 0.0145x^4 - 0.426x^3 + 3.53x^2 - 6.22x + 72,$$

where $x = 1$ corresponds to January, $x = 2$ to February, and so on. Estimate graphically when the monthly average high temperature is 75°F or more.

89. **Geometry** A cubical box is being manufactured to hold 213 cubic inches. If this measurement can vary between 212.8 cubic inches and 213.2 cubic inches inclusive, by how much can the length x of a side of the cube vary?

90. **Construction** A cylindrical aluminum can is being manufactured so that its height h is 8 centimeters more than its radius r . Estimate values for the radius (to the nearest hundredth) that result in the can having a volume between 1000 and 1500 cubic centimeters inclusive.

Variation

Exercises 91–94: Find the constant of proportionality k .

91. $y = \frac{k}{x}$, and $y = 2$ when $x = 3$
92. $y = \frac{k}{x^2}$, and $y = \frac{1}{4}$ when $x = 8$
93. $y = kx^3$, and $y = 64$ when $x = 2$
94. $y = kx^{3/2}$, and $y = 96$ when $x = 16$

Exercises 95–98: Solve the variation problem.

95. Suppose T varies directly as the $\frac{3}{2}$ power of x . When $x = 4$, $T = 20$. Find T when $x = 16$.
96. Suppose y varies directly as the second power of x . When $x = 3$, $y = 10.8$. Find y when $x = 1.5$.
97. Let y be inversely proportional to x . When $x = 6$, $y = 5$. Find y when $x = 15$.
98. Let z be inversely proportional to the third power of t . When $t = 5$, $z = 0.08$. Find z when $t = 2$.

Exercises 99–102: Assume that the constant of proportionality is positive.

99. Let y be inversely proportional to x . If x doubles, what happens to y ?
100. Let y vary inversely as the second power of x . If x doubles, what happens to y ?
101. Suppose y varies directly as the third power of x . If x triples, what happens to y ?
102. Suppose y is directly proportional to the second power of x . If x is halved, what happens to y ?

Exercises 103 and 104: The data satisfy the equation $y = kx^n$, where n is a positive integer. Determine k and n .

103.

x	2	3	4	5
y	2	4.5	8	12.5

104.

x	3	5	7	9
y	32.4	150	411.6	874.8

Exercises 105 and 106: The data in the table satisfy the equation $y = \frac{k}{x^n}$, where n is a positive integer. Determine k and n .

105.

x	2	3	4	5
y	1.5	1	0.75	0.6

106.

x	2	4	6	8
y	9	2.25	1	0.5625

107. **Allometric Growth** The weight y of a fiddler crab is directly proportional to the 1.25 power of the weight x of its claws. A crab with a body weight of 1.9 grams has claws weighing 1.1 grams. Estimate the weight of a fiddler crab with claws weighing 0.75 gram. (Source: D. Brown.)
108. **Gravity** The weight of an object varies inversely as the second power of the distance from the center of Earth. The radius of Earth is approximately 4000 miles. If a person weighs 160 pounds on Earth's surface, what would this individual weigh 8000 miles above the surface of Earth?
109. **Hubble Telescope** The brightness, or intensity, of starlight varies inversely as the square of its distance from Earth. The Hubble Telescope can see stars whose intensities are $\frac{1}{50}$ that of the faintest star now seen by ground-based telescopes. Determine how much farther the Hubble Telescope can see into space than ground-based telescopes. (Source: National Aeronautics and Space Administration.)
110. **Volume** The volume V of a cylinder with a fixed height is directly proportional to the square of its radius r . If a cylinder with a radius of 10 inches has a volume of 200 cubic inches, what is the volume of a cylinder with the same height and a radius of 5 inches?
111. **Electrical Resistance** The electrical resistance R of a wire varies inversely as the square of its diameter d . If a 25-foot wire with a diameter of 2 millimeters has a resistance of 0.5 ohm, find the resistance of a wire having the same length and a diameter of 3 millimeters.
112. **Strength of a Beam** The strength of a rectangular wood beam varies directly as the square of the depth of its cross section. If a beam with a depth of 3.5 inches can support 1000 pounds, how much weight can the same type of beam hold if its depth is 12 inches?

Exercises 113 and 114: Violin String The frequency F of a vibrating string is directly proportional to the square root of the tension T on the string and inversely proportional to the length L of the string.

113. If both the tension and the length are doubled, what happens to F ?

114. Give two ways to double the frequency F .

Writing about Mathematics

115. Describe the steps to graphically solve a polynomial inequality in the form $p(x) > 0$.

116. Describe the steps to symbolically solve a rational inequality in the form $f(x) > 0$.

4.8 Radical Equations and Power Functions

- Learn properties of rational exponents
- Learn radical notation
- Solve equations involving radical expressions
- Understand properties and graphs of power functions
- Use power functions to model data
- Solve equations involving rational exponents
- Use power regression to model data (optional)

Introduction

Johannes Kepler (1571–1630) was the first to recognize that the orbits of planets are elliptical, rather than circular. He also found that a power function models the relationship between a planet's distance from the sun and its period of revolution. Table 4.10 lists the average distance x from the sun and the time y in years for several planets to orbit the sun. The distance x has been normalized so that Earth is one unit away from the sun. For example, Jupiter is 5.2 times farther from the sun than Earth and requires 11.9 years to orbit the sun.

Table 4.10

Planet	Mercury	Venus	Earth	Mars	Jupiter	Saturn
x (distance)	0.387	0.723	1.00	1.52	5.20	9.54
y (period)	0.241	0.615	1.00	1.88	11.9	29.5

Source: C. Ronan, *The Natural History of the Universe*.

A scatterplot of the data in Table 4.10 is shown in Figure 4.112. To model these data, we might try a polynomial, such as $f(x) = x$ or $g(x) = x^2$. Figure 4.113 shows that $f(x) = x$ increases too slowly and $g(x) = x^2$ increases too fast. To model these data, a new type of function is required. That is, we need a function in the form $h(x) = x^b$, where $1 < b < 2$. Polynomials allow the exponent b to be only a nonnegative integer, whereas power functions allow b to be any real number. See Figure 4.114.

Figure 4.112 Orbital Data

Figure 4.113 Polynomial Model

Figure 4.114 Power Model

In this section we consider power functions, and in Example 8 we use a power function to model Kepler's data. Because power functions often use rational numbers as exponents, we begin by reviewing properties of exponents and radical notation.

Rational Exponents and Radical Notation

The following properties can be used to simplify expressions with rational exponents.

Algebra Review

To review integer exponents, see Chapter R (page R-7). To review radical notation and rational exponents, see Chapter R (page R-41).

Properties of Rational Exponents

Let m and n be positive integers with $\frac{m}{n}$ in lowest terms and $n \geq 2$. Let r and p be rational numbers. Assume that b is a nonzero real number and that each expression is a real number.

Property	Example
1. $b^{m/n} = (b^m)^{1/n} = (b^{1/n})^m$	$4^{3/2} = (4^3)^{1/2} = (4^{1/2})^3 = 2^3 = 8$
2. $b^{m/n} = \sqrt[n]{b^m} = (\sqrt[n]{b})^m$	$8^{2/3} = \sqrt[3]{8^2} = (\sqrt[3]{8})^2 = 2^2 = 4$
3. $(b^r)^p = b^{rp}$	$(2^{3/2})^4 = 2^6 = 64$
4. $b^{-r} = \frac{1}{b^r}$	$4^{-1/2} = \frac{1}{4^{1/2}} = \frac{1}{2}$
5. $b^r b^p = b^{r+p}$	$3^{5/2} \cdot 3^{3/2} = 3^{(5/2)+(3/2)} = 3^4 = 81$
6. $\frac{b^r}{b^p} = b^{r-p}$	$\frac{5^{5/4}}{5^{3/4}} = 5^{(5/4)-(3/4)} = 5^{1/2}$

EXAMPLE 1 Applying properties of exponents

Simplify each expression by hand.

(a) $16^{3/4}$ (b) $\frac{4^{1/3}}{4^{5/6}}$ (c) $27^{-2/3} \cdot 27^{1/3}$ (d) $(5^{3/4})^{2/3}$ (e) $(-125)^{-4/3}$

SOLUTION

(a) $16^{3/4} = (\sqrt[4]{16})^3 = (2)^3 = 8$

(b) $\frac{4^{1/3}}{4^{5/6}} = 4^{(1/3)-(5/6)} = 4^{-1/2} = \frac{1}{\sqrt{4}} = \frac{1}{2}$

(c) $27^{-2/3} \cdot 27^{1/3} = 27^{(-2/3)+(1/3)} = 27^{-1/3} = \frac{1}{\sqrt[3]{27}} = \frac{1}{3}$

(d) $(5^{3/4})^{2/3} = 5^{(3/4)(2/3)} = 5^{1/2}$ or $\sqrt{5}$

(e) $(-125)^{-4/3} = \frac{1}{(\sqrt[3]{-125})^4} = \frac{1}{(-5)^4} = \frac{1}{625}$

$$b^{m/n} = \sqrt[n]{b^m} = (\sqrt[n]{b})^m$$

$$\frac{b^r}{b^p} = b^{r-p}$$

$$(b^r)^p = b^{rp}$$

$$b^{-r} = \frac{1}{b^r}$$

Now Try Exercises 1, 7, 9, 11, and 13

EXAMPLE 2 Writing radicals with rational exponents

Use positive rational exponents to write each expression.

(a) \sqrt{x} (b) $\sqrt[3]{x^2}$ (c) $(\sqrt[4]{z})^{-5}$ (d) $\sqrt{\sqrt[3]{y} \cdot \sqrt[4]{y}}$

SOLUTION

(a) $\sqrt{x} = x^{1/2}$ (b) $\sqrt[3]{x^2} = (x^2)^{1/3} = x^{2/3}$

(c) $(\sqrt[4]{z})^{-5} = (z^{1/4})^{-5} = z^{-5/4} = \frac{1}{z^{5/4}}$

(d) $\sqrt{\sqrt[3]{y} \cdot \sqrt[4]{y}} = (y^{1/3} \cdot y^{1/4})^{1/2} = (y^{(1/3)+(1/4)})^{1/2} = (y^{7/12})^{1/2} = y^{7/24}$

Now Try Exercises 19, 21, 23, and 27 ◀

Equations Involving Radicals

In solving equations that contain square roots, it is common to square each side of an equation and then check the results. This is done in the next example.

EXAMPLE 3 Solving an equation containing a square root

Solve $x = \sqrt{15 - 2x}$. Check your answers.

SOLUTION Begin by squaring each side of the equation.

$$x = \sqrt{15 - 2x} \quad \text{Given equation}$$

$$x^2 = (\sqrt{15 - 2x})^2 \quad \text{Square each side.}$$

$$x^2 = 15 - 2x \quad \text{Simplify.}$$

$$x^2 + 2x - 15 = 0 \quad \text{Add } 2x \text{ and subtract } 15.$$

$$(x + 5)(x - 3) = 0 \quad \text{Factor.}$$

$$x = -5 \quad \text{or} \quad x = 3 \quad \text{Solve.}$$

Check: Now substitute these values in the given equation $x = \sqrt{15 - 2x}$.

$$5 \neq \sqrt{15 - 2(-5)} = 5, \quad 3 = \sqrt{15 - 2(3)}$$

Thus 3 is the only solution. This result is supported graphically in Figure 4.115, where $Y_1 = X$ and $Y_2 = \sqrt{15 - 2X}$. Notice that *no* point of intersection occurs when $x = -5$.

Now Try Exercise 37 ◀

[-9, 9, 1] by [-6, 6, 1]

Figure 4.115

The value -5 in Example 3 is called an **extraneous solution** because it does not satisfy the given equation. It is important to check results whenever *squaring* has been used to solve an equation.

NOTE If each side of an equation is raised to the same positive integer power, then any solutions to the given equation are *among* the solutions to the new equation. That is, the solutions to the equation $a = b$ are *among* the solutions to $a^n = b^n$. For this reason, we must check our answers.

In the next example, we cube each side of an equation that contains a cube root.

EXAMPLE 4 Solving an equation containing a cube root

Solve $\sqrt[3]{2x + 5} - 2 = 1$.

SOLUTION Start by adding 2 to each side. Then cube each side.

$$\sqrt[3]{2x + 5} = 3 \quad \text{Add 2 to each side.}$$

$$(\sqrt[3]{2x + 5})^3 = 3^3 \quad \text{Cube each side.}$$

$$2x + 5 = 27 \quad \text{Simplify.}$$

$$2x = 22 \quad \text{Subtract 5 from each side.}$$

$$x = 11 \quad \text{Divide by 2.}$$

The only solution is 11. The answer checks.

Now Try Exercise 45 ◀

Squaring Twice In the next example, we need to square twice to solve a radical equation.

EXAMPLE 3 Squaring twice

Solve $\sqrt{2x + 3} - \sqrt{x + 1} = 1$.

SOLUTION

Getting Started When an equation contains two square root expressions, we frequently need to square twice. Start by isolating the more complicated radical and then square each side. ▶

$\sqrt{2x + 3} - \sqrt{x + 1} = 1$	Given equation
$\sqrt{2x + 3} = 1 + \sqrt{x + 1}$	Isolate $\sqrt{2x + 3}$.
$(\sqrt{2x + 3})^2 = (1 + \sqrt{x + 1})^2$	Square each side.
$2x + 3 = 1 + 2\sqrt{x + 1} + x + 1$	Simplify.
$x + 1 = 2\sqrt{x + 1}$	Isolate the remaining radical.
$(x + 1)^2 = (2\sqrt{x + 1})^2$	Square each side again.
$x^2 + 2x + 1 = 4(x + 1)$	Simplify.
$x^2 + 2x + 1 = 4x + 4$	Distributive property
$x^2 - 2x - 3 = 0$	Subtract $4x + 4$.
$(x - 3)(x + 1) = 0$	Factor.
$x - 3 = 0 \quad \text{or} \quad x + 1 = 0$	Zero-product property
$x = 3 \quad \text{or} \quad x = -1$	Solve each equation.

Checking reveals that both -1 and 3 are solutions to the given equation.

Now Try Exercise 43 ◀

Power Functions and Models

Functions with rational exponents are often used to model physical characteristics of living organisms. For example, larger birds tend to have bigger wings. There is a relationship between a bird's weight and its wing size. (See Example 7.) This area of study in biology, in which the relative sizes of different characteristics of an organism are modeled, is called *allometry*.

Power functions often have rational exponents, and a special type of power function is a root function. These functions are defined as follows.

Power Function

A function f given by $f(x) = x^b$, where b is a constant, is a **power function**. If $b = \frac{1}{n}$ for some integer $n \geq 2$, then f is a **root function** given by $f(x) = x^{1/n}$, or equivalently, $f(x) = \sqrt[n]{x}$.

Examples of power functions include

$$f_1(x) = x^2, \quad f_2(x) = x^{3/4}, \quad f_3(x) = x^{0.4}, \quad \text{and} \quad f_4(x) = \sqrt[3]{x^2}.$$

Domains of Power Functions Suppose a positive rational number $\frac{p}{q}$ is written in lowest terms. Then the domain of $f(x) = x^{p/q}$ is all real numbers whenever q is odd and all nonnegative real numbers whenever q is even. (If b is a positive irrational number, the domain of $f(x) = x^b$ is all nonnegative real numbers.) For example, the domain of $f(x) = x^{1/3}$ ($f(x) = \sqrt[3]{x}$) is all real numbers, whereas the domain of $g(x) = x^{1/2}$ ($g(x) = \sqrt{x}$) is all nonnegative numbers.

Graphs of three common power functions are shown in Figures 4.116–4.118.

Figure 4.116 Square Root

Figure 4.117 Cube Root

Figure 4.118 Cube Root Square

EXAMPLE 6 Graphing power functions

Graph $f(x) = x^b$, where $b = 0.3, 1$, and 1.7 , for $x \geq 0$. Discuss the effect that b has on the graph of f for $x \geq 1$.

SOLUTION The graphs of $y = x^{0.3}$, $y = x^1$, and $y = x^{1.7}$ are shown in Figure 4.119. For $x \geq 1$, larger values of b cause the graph of f to increase faster. Note that each graph passes through the point $(1, 1)$. Why?

Now Try Exercises 53 and 54

NOTE Graphs of power functions with negative exponents are investigated in the Extended and Discovery Exercises for this section.

Modeling In the next two examples, we use power functions to determine weights of birds based on wing size and to describe planetary motion.

EXAMPLE 7 Modeling wing size of a bird

Heavier birds have larger wings with more surface area than do lighter birds. For some species of birds, this relationship can be modeled by $S(w) = 0.2w^{2/3}$, where w is the weight of the bird in kilograms, with $0.1 \leq w \leq 5$, and S is the surface area of the wings in square meters. (Source: C. Pennycuik, *Newton Rules Biology*.)

- Approximate $S(0.5)$ and interpret the result.
- What weight corresponds to a surface area of 0.25 square meter?

SOLUTION

- $S(0.5) = 0.2(0.5)^{2/3} \approx 0.126$. The wings of a bird that weighs 0.5 kilogram have a surface area of about 0.126 square meter.

- To answer this question we must solve the equation $0.2w^{2/3} = 0.25$.

$$0.2w^{2/3} = 0.25$$

$$w^{2/3} = \frac{0.25}{0.2} \quad \text{Divide by 0.2.}$$

$$(w^{2/3})^3 = \left(\frac{0.25}{0.2}\right)^3 \quad \text{Cube each side.}$$

Figure 4.119 $f(x) = x^b, x \geq 0$

$$w^2 = \left(\frac{0.25}{0.2} \right)^3 \quad \text{Simplify.}$$

$$w = \pm \sqrt{\left(\frac{0.25}{0.2} \right)^3} \quad \text{Square root property}$$

$$w \approx \pm 1.4 \quad \text{Approximate.}$$

Since w must be positive, the wings of a 1.4-kilogram bird have a surface area of about 0.25 square meter.

Now Try Exercise 85 ◀

EXAMPLE Modeling the period of planetary orbits

Use the data in Table 4.10 on page 340 to complete the following.

- Make a scatterplot of the data. Graphically estimate a value for b so that $f(x) = x^b$ models the data.
- Numerically check the accuracy of f .
- The average distances of Uranus, Neptune, and Pluto (no longer a planet) from the sun are 19.2, 30.1, and 39.5, respectively. Use f to estimate their periods of revolution. Compare these estimates to the actual values of 84.0, 164.8, and 248.5 years.

SOLUTION

- Graph the data and $y = x^b$ for different values of b . From the graphs of $y = x^{1.4}$, $y = x^{1.5}$, and $y = x^{1.6}$ in Figures 4.120–4.122, it can be seen that $b \approx 1.5$.

Calculator Help

To make a scatterplot, see Appendix A (page AP-3). To make a table like Figure 4.123, see Appendix A (page AP-10).

[0, 10, 1] by [0, 30, 10]

Figure 4.120

[0, 10, 1] by [0, 30, 10]

Figure 4.121

[0, 10, 1] by [0, 30, 10]

Figure 4.122

- Let $f(x) = x^{1.5}$ and table $Y_1 = X^{1.5}$. The values shown in Figure 4.123 model the data in Table 4.10 remarkably well.

X	Y ₁
.387	.24075
.723	.61476
1	1
1.52	1.874
5.2	11.858
9.54	29.466

Figure 4.123

X	Y ₁
19.2	84.13
30.1	165.14
39.5	248.25
X =	

Figure 4.124

- To approximate the number of years required for Uranus, Neptune, and Pluto to orbit the sun, evaluate $f(x) = x^{1.5}$ at $x = 19.2$, 30.1 , and 39.5 , as shown in Figure 4.124. These values are close to the actual values.

Now Try Exercise 89 ◀

Equations Involving Rational Exponents

Equations sometimes have rational exponents. The next example demonstrates a basic technique that can be used to solve some of these types of equations.

EXAMPLE 9 Solving an equation with rational exponentsSolve $2x^{5/2} - 7 = 23$. Round to the nearest hundredth and give graphical support.**Calculator Help**When entering $X^{5/2}$, be sure to put parentheses around the fraction $5/2$.

[-5, 5, 1] by [-40, 40, 10]

Figure 4.125

SOLUTION**Symbolic Solution** Start by adding 7 to each side.

$$2x^{5/2} = 30 \quad \text{Add 7 to each side.}$$

$$x^{5/2} = 15 \quad \text{Divide by 2.}$$

$$(x^{5/2})^2 = 15^2 \quad \text{Square each side.}$$

$$x^5 = 225 \quad \text{Properties of exponents}$$

$$x = 225^{1/5} \quad \text{Take the fifth root.}$$

$$x \approx 2.95 \quad \text{Approximate.}$$

Graphical Solution Graphical support is shown in Figure 4.125, where the graphs of $Y_1 = 2X^{5/2} - 7$ and $Y_2 = 23$ intersect near $(2.95, 23)$. **Now Try Exercise 69****MAKING CONNECTIONS****Solutions to $x^n = k$ (k a constant and $n \geq 2$ an integer)** **n odd:** The real solution to $x^n = k$ is $x = \sqrt[n]{k}$, or $x = k^{1/n}$, for all k .
See Example 9. **n even:** The real solutions to $x^n = k$ are $x = \pm \sqrt[n]{k}$, or $x = \pm k^{1/n}$, for $k \geq 0$. See Example 7.

Equations that have rational exponents are sometimes reducible to quadratic form.

EXAMPLE 10 Solving an equation having negative exponentsSolve $15n^{-2} - 19n^{-1} + 6 = 0$.**SOLUTION** Two methods for solving this equation are presented.**Method 1:** Use the substitution $u = n^{-1} = \frac{1}{n}$ and $u^2 = n^{-2} = \frac{1}{n^2}$.

$$15n^{-2} - 19n^{-1} + 6 = 0 \quad \text{Given equation}$$

$$15u^2 - 19u + 6 = 0 \quad \text{Let } u = n^{-1} \text{ and } u^2 = n^{-2}.$$

$$(3u - 2)(5u - 3) = 0 \quad \text{Factor.}$$

$$u = \frac{2}{3} \quad \text{or} \quad u = \frac{3}{5} \quad \text{Zero-product property}$$

Because $u = \frac{1}{n}$, it follows that $n = \frac{1}{u}$. Thus $n = \frac{3}{2}$ or $n = \frac{5}{3}$.**Method 2:** Another way to solve this equation is to multiply each side by n^2 to clear fractions.

$$15n^{-2} - 19n^{-1} + 6 = 0 \quad \text{Given equation}$$

$$n^2(15n^{-2} - 19n^{-1} + 6) = n^2(0) \quad \text{Multiply each side by } n^2.$$

$$15n^2n^{-2} - 19n^2n^{-1} + 6n^2 = 0 \quad \text{Distributive property}$$

$$15 - 19n + 6n^2 = 0 \quad \text{Properties of exponents}$$

$$\begin{aligned}
 6n^2 - 19n + 15 &= 0 && \text{Rewrite the equation.} \\
 (2n - 3)(3n - 5) &= 0 && \text{Factor.} \\
 n = \frac{3}{2} &\quad \text{or} \quad n = \frac{5}{3} && \text{Zero-product property}
 \end{aligned}$$

Now Try Exercise 73 ◀

In the next example, we solve an equation with fractional exponents that can be written in quadratic form by using substitution.

EXAMPLE 11 Solving an equation having fractions for exponents

Solve $2x^{2/3} + 5x^{1/3} - 3 = 0$.

SOLUTION To solve this equation, use the substitution $u = x^{1/3}$.

$$\begin{aligned}
 2x^{2/3} + 5x^{1/3} - 3 &= 0 && \text{Given equation} \\
 2(x^{1/3})^2 + 5(x^{1/3}) - 3 &= 0 && \text{Properties of exponents} \\
 2u^2 + 5u - 3 &= 0 && \text{Let } u = x^{1/3}. \\
 (2u - 1)(u + 3) &= 0 && \text{Factor.} \\
 u = \frac{1}{2} &\quad \text{or} \quad u = -3 && \text{Zero-product property}
 \end{aligned}$$

Because $u = x^{1/3}$, it follows that $x = u^3$. Thus $x = \left(\frac{1}{2}\right)^3 = \frac{1}{8}$ or $x = (-3)^3 = -27$.

Now Try Exercise 77 ◀

Power Regression (Optional)

Rather than visually fit a curve to data, as was done in Example 8, we can use least-squares regression to fit the data. Least-squares regression was introduced in Section 2.1. In the next example, we apply this technique to data from biology.

EXAMPLE 12 Modeling the length of a bird's wing

Table 4.11 lists the weight W and the wingspan L for birds of a particular species.

Table 4.11 Weights and Wingspans

W (kilograms)	0.5	1.5	2.0	2.5	3.0
L (meters)	0.77	1.10	1.22	1.31	1.40

Source: C. Pennycuik.

- Use power regression to model the data with $L = aW^b$. Graph the data and the equation.
- Approximate the wingspan for a bird weighing 3.2 kilograms.

SOLUTION

- Let x be the weight W and y be the length L . See Figures 4.126–4.129 on the next page. Enter the data, and then select power regression (PwrReg), as shown in Figures 4.126 and 4.127. The results are shown in Figure 4.128. Let

$$y = 0.9674x^{0.3326} \quad \text{or} \quad L = 0.9674W^{0.3326}$$

The data and equation are graphed in Figure 4.129.

- If a bird weighs 3.2 kilograms, this model predicts the wingspan to be

$$L = 0.9674(3.2)^{0.3326} \approx 1.42 \text{ meters.}$$

Calculator Help

To find an equation of least-squares fit, see Appendix A (page AP-11).

4.8 Putting It All Together

The following table outlines important concepts in this section.

Concept	Explanation	Examples
Rational exponents	$x^{m/n} = (x^m)^{1/n}$ $= (x^{1/n})^m$	$9^{3/2} = (9^3)^{1/2} = (729)^{1/2} = 27$ $9^{3/2} = (9^{1/2})^3 = (3)^3 = 27$
Radical notation	$x^{1/2} = \sqrt{x}$ $x^{1/3} = \sqrt[3]{x}$ $x^{m/n} = \sqrt[n]{x^m}$ $= (\sqrt[n]{x})^m$	$25^{1/2} = \sqrt{25} = 5$ $27^{1/3} = \sqrt[3]{27} = 3$ $8^{2/3} = \sqrt[3]{8^2} = \sqrt[3]{64} = 4$ $4^{3/2} = \sqrt{4^3} = (\sqrt{4})^3 = (2)^3 = 8$
Solving radical equations	The solutions to $a = b$ are among the solutions to $a^n = b^n$ when n is a positive integer. Check your results.	Solve $\sqrt{2x + 3} = x$. $2x + 3 = x^2$ Square each side. $x^2 - 2x - 3 = 0$ Rewrite equation. $x = -1$ or $x = 3$ Factor and solve. Checking reveals that 3 is the only solution.
Power function	$f(x) = x^b$, where b is a constant	$f(x) = x^{5/4}$ $g(x) = x^{-3.14}$
Root function	$f(x) = x^{1/n}$, where $n \geq 2$ is an integer	$f(x) = x^{1/2}$ or $f(x) = \sqrt{x}$ $g(x) = x^{1/5}$ or $g(x) = \sqrt[5]{x}$

Several types of functions are listed in the following summary, which may be used as a reference for future work. Unless specified otherwise, each tick mark represents 1 unit.

Type of Function	Examples	Graphs
Linear function $f(x) = ax + b$	$f(x) = 0.5x - 1$ $g(x) = -3x + 2$ $h(x) = 2$	
Polynomial function $f(x) = a_nx^n + \cdots + a_2x^2 + a_1x + a_0$	$f(x) = x^2 - 1$ $g(x) = x^3 - 4x - 1$ $h(x) = -x^4 + 4x^2 - 2$	
Rational function $f(x) = \frac{p(x)}{q(x)}$, where $p(x)$ and $q(x)$ are polynomials with $q(x) \neq 0$	$f(x) = \frac{1}{x}$ $g(x) = \frac{2x - 1}{x + 2}$ $h(x) = \frac{1}{x^2 - 1}$	
Root function $f(x) = x^{1/n}$, where $n \geq 2$ is an integer	$f(x) = x^{1/2} = \sqrt{x}$ $g(x) = x^{1/3} = \sqrt[3]{x}$ $h(x) = x^{1/4} = \sqrt[4]{x}$	
Power function $f(x) = x^b$, where b is a constant	$f(x) = x^{2/3}$ $g(x) = x^{1.41}$ $h(x) = x^3$	

4.8 Exercises

Properties of Exponents

Exercises 1–18: Evaluate the expression by hand.

1. $8^{2/3}$
2. $-16^{3/2}$
3. $16^{-3/4}$
4. $25^{-3/2}$
5. $-81^{0.5}$
6. $32^{1/5}$
7. $(9^{3/4})^2$
8. $(4^{-1/2})^{-4}$
9. $\frac{8^{5/6}}{8^{1/2}}$
10. $\frac{4^{-1/2}}{4^{3/2}}$
11. $27^{5/6} \cdot 27^{-1/6}$
12. $16^{2/3} \cdot 16^{-1/6}$
13. $(-27)^{-5/3}$
14. $(-32)^{-3/5}$
15. $(0.5^{-2})^2$
16. $(2^{-2})^{-3/2}$
17. $(\frac{2}{3})^{-2}$
18. $(8^{-1/3} + 27^{-1/3})^2$

Exercises 19–28: Use positive exponents to rewrite.

19. $\sqrt{2x}$
20. $\sqrt{x+1}$
21. $\sqrt[3]{z^5}$
22. $\sqrt[5]{x^2}$
23. $(\sqrt[4]{y})^{-3}$
24. $(\sqrt[3]{y^2})^{-5}$
25. $\sqrt{x} \cdot \sqrt[3]{x}$
26. $(\sqrt[5]{z})^{-3}$
27. $\sqrt{y} \cdot \sqrt{y}$
28. $\frac{\sqrt[3]{x}}{\sqrt{x}}$

Exercises 29–32: Use radical notation to rewrite.

29. $a^{-3/4}b^{1/2}$
30. $a^{-2/3}b^{3/5}$
31. $(a^{1/2} + b^{1/2})^{1/2}$
32. $(a^{3/4} - b^{3/2})^{1/3}$

Equations Involving Radicals

Exercises 33–50: Solve the equation. Check your answers.

33. $\sqrt{x+2} = x-4$
34. $\sqrt{2x+1} = 13$
35. $\sqrt{3x+7} = 3x+5$
36. $\sqrt{1-x} = x+5$
37. $\sqrt{5x-6} = x$
38. $x-5 = \sqrt{5x-1}$
39. $\sqrt{x+5} + 1 = x$
40. $\sqrt{4-3x} = x+8$
41. $\sqrt{x+1} + 3 = \sqrt{3x+4}$
42. $\sqrt{x} = \sqrt{x-5} + 1$

$$43. \sqrt{2x} - \sqrt{x+1} = 1$$

$$44. \sqrt{2x-4} + 2 = \sqrt{3x+4}$$

$$45. \sqrt[3]{z+1} = -3 \quad 46. \sqrt[3]{z} + 5 = 4$$

$$47. \sqrt[3]{x+1} = \sqrt[3]{2x-1} \quad 48. \sqrt[3]{2x^2+1} = \sqrt[3]{1-x}$$

$$49. \sqrt[4]{x-2} + 4 = 20 \quad 50. \sqrt[4]{2x+3} = \sqrt{x+1}$$

Power Functions

Exercises 51 and 52: Evaluate $f(x)$ at the given x . Approximate each result to the nearest hundredth.

$$51. f(x) = x^{3/2} - x^{1/2}, \quad x = 50$$

$$52. f(x) = x^{5/4} - x^{-3/4}, \quad x = 7$$

Exercises 53 and 54: Match $f(x)$ with its graph. Assume that a and b are constants with $0 < a < 1 < b$.

$$53. f(x) = x^a$$

$$54. f(x) = x^b$$

Exercises 55–60: Use translations to graph f .

$$55. f(x) = \sqrt{x} + 1$$

$$56. f(x) = \sqrt[3]{x-1}$$

$$57. f(x) = x^{2/3} - 1$$

$$58. f(x) = \sqrt{x-1}$$

$$59. f(x) = \sqrt{x+2} - 1$$

$$60. f(x) = (x-1)^{2/3}$$

Equations Involving Rational Exponents

Exercises 61–82: Solve the equation. Check your answers.

$$61. x^3 = 8$$

$$62. x^4 = \frac{1}{81}$$

$$63. x^{1/4} = 3$$

$$64. x^{1/3} = \frac{1}{5}$$

$$65. x^{2/5} = 4$$

$$66. x^{2/3} = 16$$

$$67. 2(x^{1/5} - 2) = 0$$

$$68. x^{1/2} + x^{1/2} = 8$$

$$69. 4x^{3/2} + 5 = 21$$

$$70. 2x^{1/3} - 5 = 1$$

$$71. n^{-2} + 3n^{-1} + 2 = 0$$

$$72. 2n^{-2} - n^{-1} = 3$$

73. $5n^{-2} + 13n^{-1} = 28$ 74. $3n^{-2} - 19n^{-1} + 20 = 0$

75. $x^{2/3} - x^{1/3} - 6 = 0$ 76. $x^{2/3} + 9x^{1/3} + 14 = 0$

77. $6x^{2/3} - 11x^{1/3} + 4 = 0$

78. $10x^{2/3} + 29x^{1/3} + 10 = 0$

79. $x^{3/4} - x^{1/2} - x^{1/4} + 1 = 0$

80. $x^{3/4} - 2x^{1/2} - 4x^{1/4} + 8 = 0$

81. $x^{-2/3} - 2x^{-1/3} - 3 = 0$

82. $6x^{-2/3} - 13x^{-1/3} - 5 = 0$

Exercises 83 and 84: Average Rate of Change Let the distance from home in miles of a person after t hours on a straight path be given by $s(t)$. Approximate the average rate of change of s from $t_1 = \frac{1}{2}$ to $t_2 = \frac{9}{2}$ to the nearest tenth and interpret the result.

83. $s(t) = \sqrt{96t}$

84. $s(t) = 3t^{3/4}$

Applications and Models

85. Modeling Wing Size Suppose that the surface area S of a bird's wings in square feet can be modeled by $S(w) = 1.27w^{2/3}$, where w is the weight of the bird in pounds, with $1 \leq w \leq 10$. Estimate the weight of a bird with wings having a surface area of 3 square feet.

86. Modeling Wingspan The wingspan L in feet of a bird weighing W pounds is given by $L = 2.43W^{0.3326}$. Estimate the wingspan of a bird that weighs 5.2 pounds.

87. Modeling Planetary Orbits The formula $f(x) = x^{1.5}$ calculates the number of years it takes for a planet to orbit the sun if its average distance from the sun is x times that of Earth. If there were a planet located 15 times as far from the sun as Earth, how many years would it take for the planet to orbit the sun?

88. Modeling Planetary Orbits (Refer to Exercise 87.) If there were a planet that took 200 years to orbit the sun, what would be its average distance x from the sun compared to that of Earth?

89. Trout and Pollution Rainbow trout are sensitive to zinc ions in the water. High concentrations are lethal. The average survival times x in minutes for trout in various concentrations of zinc ions y in milligrams per liter (mg/L) are listed in the table.

x (min)	0.5	1	2	3
y (mg/L)	4500	1960	850	525

Source: C. Mason, *Biology of Freshwater Pollution*.

(a) These data can be modeled by $f(x) = ax^b$, where a and b are constants. Determine an appropriate value for a . (Hint: Let $f(1) = 1960$.)

(b) Estimate b .

(c) Evaluate $f(4)$ and interpret the result.

90. Lunar Orbits for Jupiter Use the data in the table to complete the following.

Moons of Jupiter	Distance (10^3 km)	Period (days)
Metis	128	0.29
Almathea	181	0.50
Thebe	222	0.67
Europa	671	3.55
Ganymede	1070	7.16
Callisto	1883	16.69

(a) Make a scatterplot of the data. Estimate a value for b so that $f(x) = 0.0002x^b$ models the data.

(b) Numerically check the accuracy of f .

(c) The moon Io is 422 thousand kilometers from Jupiter. Estimate its period and compare the estimate to the actual value of 1.77 days. Did your estimate involve interpolation or extrapolation?

91. **Fiddler Crab Size** Allometric relations often can be modeled by $f(x) = ax^b$, where a and b are constants. One study showed that for a male fiddler crab weighing over 0.75 gram, the weight of its claws can be estimated by $f(x) = 0.445x^{1.25}$. The input x is the weight of the crab in grams, and the output $f(x)$ is the weight of the claws in grams. (Sources: J. Huxley, *Problems of Relative Growth*; D. Brown and P. Rothery, *Models in Biology: Mathematics, Statistics and Computing*.)

- (a) Predict the weight of the claws of a 2-gram crab.
-  (b) Approximate graphically the weight of a crab that has 0.5-gram claws.
- (c) Solve part (b) symbolically.

92. **Weight and Height** Allometry can be applied to height-weight relationships for humans. The average weight in pounds for men and women can sometimes be estimated by $f(x) = ax^{1.7}$, where x is a person's height in inches and a is a constant determined by the sex of the individual.

- (a) If the average weight of a 68-inch-tall man is 152 pounds, approximate a . Use f to estimate the average weight of a 66-inch-tall man.
- (b) If the average weight of a 68-inch-tall woman is 137 pounds, approximate a . Use f to estimate the average weight of a 70-inch-tall woman.

 **Exercises 93 and 94: Power Regression** The table contains data that can be modeled by a function of the form $f(x) = ax^b$. Use regression to find the constants a and b to the nearest hundredth. Graph f and the data.

93.

x	2	4	6	8
$f(x)$	3.7	4.2	4.6	4.9

94.

x	3	6	9	12
$f(x)$	23.8	58.5	99.2	144

95. **Wal-Mart Employees** The table lists numbers N of Wal-Mart employees (in millions) x years after 1980.

x	7	12	17	22	27
N	0.20	0.37	0.68	1.4	2.2

Source: Wal-Mart.

-  (a) Find a power function f that models the data in the table.

- (b) Use f to predict the number of employees in the year 2012. Did your answer involve interpolation or extrapolation?

- (c) When did the number of employees first reach 1 million?

96. **DVD Rentals** The table lists numbers of titles T released for DVD rentals x years after 1995.

x	3	4	5	6	7
T	2049	4787	8723	14,321	21,260

Source: DVD Release Report.

-  (a) Find a power function f that models the data in the table.

- (b) Use f to estimate the number of titles released in 2006. Did your answer involve interpolation or extrapolation?

- (c) When did the number of releases first surpass 45,000?

-  97. **Pulse Rate and Weight** According to one model, the rate at which an animal's heart beats varies with its weight. Smaller animals tend to have faster pulses, whereas larger animals tend to have slower pulses. The table lists average pulse rates in beats per minute (bpm) for animals with various weights in pounds (lb). Use regression (or some other method) to find values for a and b so that $f(x) = ax^b$ models these data.

Weight (lb)	40	150	400	1000	2000
Pulse (bpm)	140	72	44	28	20

Source: C. Pennycuik.

98. **Pulse Rate and Weight** (Continuation of Exercise 97) Use the results in the previous exercise to calculate the pulse rates for a 60-pound dog and a 2-ton whale.

Writing about Mathematics

99. Can a function be both a polynomial function and a power function? Explain.
100. Explain the basic steps needed to solve equations that contain square roots of variables.

EXTENDED AND DISCOVERY EXERCISES

-  1. **Odd Root Functions** Graph $y = \sqrt[n]{x}$ for $n = 3, 5$, and 7. State some generalizations about a graph of an odd root function.
-  2. **Even Root Functions** Graph $y = \sqrt[n]{x}$ for $n = 2, 4$, and 6. State some generalizations about a graph of an even root function.
-  3. **Power Functions** Graph $y = x^b$ for $b = -1, -3$, and -5 . State some generalizations about a graph of a power function, where b is a negative odd integer.
-  4. **Power Functions** Graph $y = x^b$ for $b = -2, -4$, and -6 . State some generalizations about a graph of a power function, where b is a negative even integer.

Exercises 5 and 6: **Difference Quotient** Find the difference quotient of f .

5. $f(x) = \sqrt{x}$

6. $f(x) = \frac{1}{x}$

Exercises 7–10: **Negative Rational Exponents** Write the expression as one ratio without any negative exponents.

7. $\frac{x^{-2/3} + x^{1/3}}{x}$

8. $\frac{x^{1/4} - x^{-3/4}}{x}$

9. $\frac{\frac{2}{3}(x+1)x^{-1/3} - x^{2/3}}{(x+1)^2}$

10. $\frac{(x^2+1)^{1/2} - \frac{1}{2}x(x^2+1)^{-1/2}(2x)}{x^2+1}$

CHECKING BASIC CONCEPTS FOR SECTIONS 4.7 AND 4.8

- (a) $\frac{3x-1}{1-x} = 1$ (b) $3 + \frac{8}{x} = \frac{35}{x^2}$
- (c) $\frac{1}{x-1} - \frac{1}{3(x+2)} = \frac{1}{x^2+x-2}$
2. Solve $2x^3 + x^2 - 6x < 0$.
3. Solve $\frac{x^2-1}{x+2} \geq 0$.
4. Let y vary inversely as the cube of x . If $x = \frac{1}{3}$, then $y = 150$. Find y if $x = \frac{1}{2}$.
5. Simplify each expression without a calculator.
- (a) $-4^{3/2}$ (b) $(8^{-2})^{1/3}$ (c) $\sqrt[3]{27^2}$
6. Solve the equation $4x^{3/2} - 3 = 29$.
7. Solve the equation $\sqrt{5x-4} = x-2$.
8. Solve each equation.
- (a) $n^{-2} + 6n^{-1} = 16$
- (b) $2x^{2/3} + 5x^{1/3} - 12 = 0$
9. Find a and b so that $f(x) = ax^b$ models the data.

x	1	2	3	4
$f(x)$	2	2.83	3.46	4

Summary

CONCEPT

EXPLANATION AND EXAMPLES

SECTION 4.1 MORE NONLINEAR FUNCTIONS AND THEIR GRAPHS

Polynomial Function

Can be represented by $f(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0$.
The leading coefficient is $a_n \neq 0$ and the degree is n .

Example: $f(x) = -4x^3 - 2x^2 + 6x + \frac{1}{2}$; $a_n = -4$; $n = 3$

Absolute and Local Extrema

The accompanying graph has the following extrema.

Absolute maximum: none

Absolute minimum: -14.8

Local maximum: 1

Local minima: $-4.3, -14.8$

Symmetry

Even function: $f(-x) = f(x)$; the graph is symmetric with respect to the y -axis.

Odd function: $f(-x) = -f(x)$; the graph is symmetric with respect to the origin.

Examples: $f(x) = x^4 - 3x^2$

Even Function

$f(x) = x - x^3$

Odd Function

SECTION 4.2 POLYNOMIAL FUNCTIONS AND MODELS

Graphs of Polynomial Functions

Their graphs are continuous with no breaks, and their domains include all real numbers. The graph of a polynomial function of degree $n \geq 1$ has at most n x -intercepts and at most $n - 1$ turning points. For a discussion of the end behavior for graphs of polynomial functions, see page 264.

Examples: See “Putting It All Together” for Section 4.2 on pages 269–270.

Piecewise-Polynomial Functions

Example:

$$f(x) = \begin{cases} x^2 - 2 & \text{if } x < 0 \\ 1 - 2x & \text{if } x \geq 0 \end{cases}$$

$$f(-2) = (-2)^2 - 2 = 2$$

$$f(0) = 1 - 2(0) = 1$$

$$f(2) = 1 - 2(2) = -3$$

f is discontinuous at $x = 0$.

CONCEPT EXPLANATION AND EXAMPLES

SECTION 4.3 DIVISION OF POLYNOMIALS

Division Algorithm

Let $f(x)$ and $d(x)$ be two polynomials with the degree of $d(x)$ greater than zero and less than the degree of $f(x)$. Then there exist unique polynomials $q(x)$ and $r(x)$ such that

$$f(x) = d(x) \cdot q(x) + r(x),$$

where either $r(x) = 0$ or the degree of $r(x)$ is less than the degree of $d(x)$. That is,

$$(\text{Dividend}) = (\text{Divisor}) \cdot (\text{Quotient}) + (\text{Remainder}).$$

Example: $\frac{x^2 - 4x + 5}{x - 1} = x - 3 + \frac{2}{x - 1}$. That is,

$$x^2 - 4x + 5 = (x - 1)(x - 3) + 2.$$

Remainder Theorem

If a polynomial $f(x)$ is divided by $x - k$, the remainder is $f(k)$.

Example: If $x^2 - 4x + 5$ is divided by $x - 1$, the remainder is

$$f(1) = 1^2 - 4(1) + 5 = 2.$$

SECTION 4.4 REAL ZEROS OF POLYNOMIAL FUNCTIONS

Factor Theorem

A polynomial $f(x)$ has a factor $x - k$ if and only if $f(k) = 0$.

Example: $f(x) = x^2 - 3x + 2$;
 $f(1) = 0$ implies that $(x - 1)$ is a factor of $x^2 - 3x + 2$.

Complete Factored Form

$f(x) = a_n(x - c_1)(x - c_2) \cdots (x - c_n)$, where a_n is the leading coefficient of the polynomial $f(x)$ and the c_k are its zeros. This form is unique.

Example: $f(x) = -2x^3 + 8x$ has zeros of -2 , 0 , and 2 .
 $f(x) = -2(x + 2)(x - 0)(x - 2)$

Multiple Real Zeros

Odd multiplicity: Graph crosses the x -axis.

Even multiplicity: Graph touches but does not cross the x -axis.

Example: Let $f(x) = -2(x + 1)^3(x - 4)^2$; $f(x)$ has a zero of -1 with odd multiplicity 3 and a zero of 4 with even multiplicity 2.

CONCEPT AND EXPLANATION AND EXAMPLES

SECTION 4.4 REAL ZEROS OF POLYNOMIAL FUNCTIONS (CONTINUED)

Polynomial Equations

Polynomial equations can be solved symbolically, graphically, and numerically. A common symbolic technique is factoring.

Example: Solve $x^3 - 4x = 0$ symbolically and graphically.

Symbolic Solution

$$\begin{aligned}x(x^2 - 4) &= 0 \\x(x - 2)(x + 2) &= 0 \\x = 0, \quad x = 2, \quad \text{or} \quad x = -2\end{aligned}$$

Graphical Solution

The x -intercepts are -2 , 0 , and 2 .

SECTION 4.5 THE FUNDAMENTAL THEOREM OF ALGEBRA

Fundamental Theorem of Algebra

A polynomial $f(x)$ of degree $n \geq 1$ has at least one complex zero.

Explanation: With complex numbers, any polynomial can be written in complete factored form.

Examples: $x^2 + 1 = (x + i)(x - i)$
 $3x^2 - 3x - 6 = 3(x + 1)(x - 2)$

Number of Zeros Theorem

A polynomial of degree n has at most n distinct zeros.

Example: A cubic polynomial has at most 3 distinct zeros.

Polynomial Equations with Complex Solutions

Polynomial equations can have both real and imaginary solutions.

Example: Solve $x^4 - 1 = 0$.

$$\begin{aligned}(x^2 - 1)(x^2 + 1) &= 0 \\(x - 1)(x + 1)(x^2 + 1) &= 0 \\x = 1, \quad x = -1, \quad \text{or} \quad x^2 = -1 \\x &= \pm 1, \pm i\end{aligned}$$

The x -intercepts are -1 and 1 . Imaginary solutions cannot be found from a graph.

SECTION 4.6 RATIONAL FUNCTIONS AND MODELS

Rational Functions

$f(x) = \frac{p(x)}{q(x)}$, where $p(x)$ and $q(x) \neq 0$ are polynomials

Example: $f(x) = \frac{2x - 3}{x - 1}$

Horizontal asymptote: $y = 2$

Vertical asymptote: $x = 1$

To find vertical and horizontal asymptotes, see page 312.

To graph rational functions by hand, see page 316.

CONCEPT EXPLANATION AND EXAMPLES

SECTION 4.7 MORE EQUATIONS AND INEQUALITIES

Solving Rational Equations Multiply each side by the LCD. Check your results.

Example: $\frac{-24}{x-3} - 4 = x + 3$

$$-24 - 4(x-3) = (x+3)(x-3) \quad \text{Multiply by } x-3.$$

$$-24 - 4x + 12 = x^2 - 9 \quad \text{Multiply.}$$

$$0 = x^2 + 4x + 3 \quad \text{Combine terms.}$$

$$0 = (x+3)(x+1) \quad \text{Factor.}$$

$$x = -3 \quad \text{or} \quad x = -1 \quad \text{Both solutions check.}$$

Direct Variation

Let x and y denote two quantities and n be a positive number. Then y is *directly proportional to the n th power of x* , or y *varies directly as the n th power of x* , if there exists a nonzero number k such that $y = kx^n$.

Example: Because $V = \frac{4}{3}\pi r^3$, the volume of a sphere varies directly as the third power of the radius. The constant of variation is $\frac{4}{3}\pi$.

Inverse Variation

Let x and y denote two quantities and n be a positive number. Then y is *inversely proportional to the n th power of x* , or y *varies inversely as the n th power of x* , if there exists a nonzero number k such that $y = \frac{k}{x^n}$.

Example: Because $I = \frac{k}{d^2}$, the intensity of a light source varies inversely as the square of the distance from the light source.

Polynomial Inequality

Write the inequality as $p(x) > 0$, where $>$ may be replaced by \geq , $<$, or \leq . Replace the inequality sign with an equals sign, and solve this equation. The solutions are called boundary numbers. Then use a graph or table to find the solution set to the given inequality.

Example: $4x - x^3 > 0$; Boundary numbers: $-2, 0, 2$
Solution set: $(-\infty, -2) \cup (0, 2)$

Rational Inequality

As with polynomial inequalities, find the boundary numbers, including x -values where any expressions are undefined.

Example: $\frac{(x+2)(x-3)}{x} \geq 0$
Boundary numbers: $-2, 0, 3$
Solution set: $[-2, 0) \cup [3, \infty)$

CONCEPT EXPLANATION AND EXAMPLES

SECTION 4.8 RADICAL EQUATIONS AND POWER FUNCTIONS

Rational Exponents

$$x^{m/n} = \sqrt[n]{x^m} = (\sqrt[n]{x})^m$$

Example: $25^{3/2} = \sqrt{25^3} = (\sqrt{25})^3 = 5^3 = 125$

Solving Radical Equations

When an equation contains a square root, isolate the square root and then square each side. *Be sure to check your results.*

Example: $x + \sqrt{3x - 3} = 1$

$$\sqrt{3x - 3} = 1 - x$$

$$3x - 3 = (1 - x)^2$$

$$3x - 3 = 1 - 2x + x^2$$

$$0 = x^2 - 5x + 4$$

$$0 = (x - 1)(x - 4)$$

$$x = 1 \text{ or } x = 4$$

Given equation

Subtract x .

Square each side.

Check: 1 is a solution, but 4 is not.

$$1 + \sqrt{3(1) - 3} = 1 \quad 4 + \sqrt{3(4) - 3} \neq 1$$

Power Function

$f(x) = x^b$, where b is a constant

Example: $f(x) = x^{4/3}$, $g(x) = x^{1.72}$

4 Review Exercises

1. State the degree and leading coefficient of the polynomial $f(x) = 4 + x - 2x^2 - 7x^3$.

Exercises 2 and 3: Use the graph of f to estimate any

(a) local extrema and (b) absolute extrema.

2.

3.

4. Graph $f(x) = -0.25x^4 + 0.67x^3 + 9.5x^2 - 20x - 50$.

- (a) Approximate any local extrema.
(b) Approximate any absolute extrema.
(c) Determine where f is increasing or decreasing.

5. Graph $f(x) = x^4 + 2x^3 - 9x^2 - 2x + 20$. Count the local maxima, local minima, and x -intercepts.

6. Graph f . Estimate any turning points.

$$f(x) = 0.03x^5 - 0.21x^4 + 0.21x^3 + 0.57x^2 - 0.48x - 0.6$$

Exercises 7–10: Determine if f is even, odd, or neither.

7. $f(x) = 2x^6 - 5x^4 - x^2$ 8. $f(x) = -5x^3 - 18$

9. $f(x) = 7x^5 + 3x^3 - x$ 10. $f(x) = \frac{1}{1 + x^2}$

Exercises 11 and 12: The table is a complete representation of f . Decide if f is even, odd, or neither.

11.

x	-4	-2	0	2	4
$f(x)$	13	7	0	-7	-13

12.

x	-5	-3	-1	1	3	5
$f(x)$	-6	2	7	7	2	-6

Exercises 13 and 14: Sketch a graph of a polynomial function that satisfies the given conditions.

13. Cubic polynomial, two x -intercepts, and a positive leading coefficient
14. Degree 4 with a positive leading coefficient, three turning points, and one x -intercept

Exercises 15 and 16: Use the graph of the polynomial function f to complete the following.

- (a) Determine the number of turning points and estimate any x -intercepts.
- (b) State whether $a > 0$ or $a < 0$.
- (c) Determine the minimum degree of f .

Exercises 17 and 18: State the end behavior of f .

17. $f(x) = -2x^3 + 4x - 2$

18. $f(x) = 1 - 2x - x^4$

19. Find the average rate of change of $f(x) = x^3 + 1$ from $x = -2$ to $x = -1$.

20. Find the difference quotient for $g(x) = 4x^3$.

21. Let $f(x)$ be given by

$$f(x) = \begin{cases} 2x & \text{if } 0 \leq x < 2 \\ 8 - x^2 & \text{if } 2 \leq x \leq 4. \end{cases}$$

- (a) Sketch a graph of f . Is f continuous on its domain?

(b) Evaluate $f(1)$ and $f(3)$.

(c) Solve the equation $f(x) = 2$.

22. Determine the type of symmetry that the graph of $g(x) = x^5 - 4x^3$ exhibits.

Exercises 23–26: Divide the expression.

23. $\frac{14x^3 - 21x^2 - 7x}{7x}$ 24. $\frac{2x^3 - x^2 - 4x + 1}{x + 2}$

25. $\frac{4x^3 - 7x + 4}{2x + 3}$ 26. $\frac{3x^3 - 5x^2 + 13x - 18}{x^2 + 4}$

27. The polynomial given by $f(x) = \frac{1}{2}x^3 - 3x^2 + \frac{11}{2}x - 3$ has zeros 1, 2, and 3. Write its complete factored form.

28. Find the complete factored form of the polynomial $f(x) = x^4 + 2x^3 - 13x^2 - 14x + 24$ given that 1 and 3 are zeros.

29. Find the complete factored form of the polynomial $f(x) = 2x^3 + 3x^2 - 18x + 8$ graphically.

30. Write a complete factored form of a quintic (degree 5) polynomial $f(x)$ that has zeros -2 and 2 with multiplicities 2 and 3, respectively.

31. Use the graph of $y = f(x)$ to write its complete factored form. (Do not assume that the leading coefficient is ± 1 .)

32. What is the maximum number of times that a horizontal line can intersect the graph of each type of polynomial?
(a) linear (degree 1) (b) quadratic (c) cubic

Exercises 33 and 34: Use the rational zero test to determine any rational zeros of $f(x)$.

33. $f(x) = 2x^3 + x^2 - 13x + 6$

34. $f(x) = x^3 + x^2 - 11x - 11$

Exercises 35–38: Solve the equation.

35. $9x = 3x^3$ 36. $x^3 - x^2 - 6x = 0$
 37. $x^4 - 3x^2 + 2 = 0$ 38. $2x^3 + x^2 = 6x + 3$

Exercises 39 and 40: Solve the equation graphically. Round your answers to the nearest hundredth.

39. $x^3 - 3x + 1 = 0$ 40. $x^4 - 2x = 2$

Exercises 41–44: Write the expression in standard form.

41. $(2 - 2i) + (-3 + 2i)$ 42. $(-5 + 4i) - (-3 - 4i)$
 43. $(3 + 2i)^2$ 44. $\frac{3 + i}{1 + i}$

Exercises 45 and 46: Find all real and imaginary solutions.

45. $x^3 + x = 0$ 46. $x^4 + 3x^2 + 2 = 0$

47. Determine graphically the number of real zeros and the number of imaginary zeros of the polynomial function $f(x) = x^3 - 3x^2 + 3x - 9$.

48. Write a polynomial $f(x)$ in complete factored form that has degree 3, leading coefficient 4, and zeros 1, $3i$, and $-3i$. Then write $f(x)$ in expanded form.

49. Find the complete factorization of $f(x) = 2x^2 + 4$.

50. Use the graph of $f(x) = 2x^4 - x^2 - 1$ to predict the number of real zeros and the number of imaginary zeros of f . Find these zeros symbolically.

51. If a zero of f is i , find the complete factored form of $f(x) = x^4 + x^3 + 2x^2 + x + 1$.

52. State the domain of $f(x) = \frac{3x - 2}{5x + 4}$. Identify any horizontal or vertical asymptotes in the graph of f .

53. Find any horizontal or vertical asymptotes in the graph of

$$f(x) = \frac{2x^2 + x - 15}{3x^2 + 8x - 3}$$

54. Let $f(x) = \frac{2x^2}{x^2 - 4}$.

- (a) Find the domain of f .
 (b) Identify any horizontal or vertical asymptotes.
 (c) Graph f with a graphing calculator.
 (d) Sketch a graph of f that includes all asymptotes.

Exercises 55–58: Graph $y = g(x)$ by hand.

55. $g(x) = \frac{1}{x + 1} - 2$ 56. $g(x) = \frac{x}{x - 1}$
 57. $g(x) = \frac{x^2 - 1}{x^2 + 2x + 1}$ 58. $g(x) = \frac{2x - 3}{2x^2 + x - 6}$

59. Sketch a graph of a function f with vertical asymptote $x = -2$ and horizontal asymptote $y = 2$.

60. Solve the equation $\frac{3x}{x - 2} = 2$ symbolically, graphically, and numerically.

Exercises 61–66: Solve the equation. Check your results.

61. $\frac{5x + 1}{x + 3} = 3$ 62. $\frac{1}{x} - \frac{1}{x^2} + 2 = 0$
 63. $\frac{1}{x + 2} + \frac{1}{x - 2} = \frac{4}{x^2 - 4}$
 64. $x - \frac{1}{x} = 4$
 65. $\frac{x + 5}{x - 2} = \frac{x - 1}{x + 1}$ 66. $\frac{2x - 5}{3x + 1} = 5$

Exercises 67 and 68: Use the graph of f to solve each inequality.

- (a) $f(x) > 0$ (b) $f(x) < 0$

67.

68.

Exercises 69–72: Solve the inequality.

69. $x^3 + x^2 - 6x > 0$ 70. $x^4 + 4 < 5x^2$

71. $\frac{2x-1}{x+2} > 0$

72. $\frac{1}{x} + \frac{1}{x+2} \leq \frac{4}{3}$

Exercises 73–76: Evaluate the radical expression by hand.

73. $(36^{3/4})^2$

74. $(9^{-3/2})^{-2}$

75. $(2^{-3/2} \cdot 2^{1/2})^{-3}$

76. $\left(\frac{4}{9}\right)^{-3/2}$

Exercises 77–80: Write the radical expression using positive exponents.

77. $\sqrt[3]{x^4}$

78. $(\sqrt[4]{z})^{-1/2}$

79. $\sqrt[3]{y} \cdot \sqrt{y}$

80. $\sqrt{x} \cdot \sqrt[3]{x^2} \cdot \sqrt[4]{x^3}$

Exercises 81 and 82: Give the domain of the power function. Approximate $f(3)$ to the nearest hundredth.

81. $f(x) = x^{5/2}$

82. $f(x) = x^{-2/3}$

Exercises 83–96: Solve the equation. Check your results.

83. $x^5 = 1024$

84. $x^{1/3} = 4$

85. $\sqrt{x-2} = x-4$

86. $x^{3/2} = 27$

87. $2x^{1/4} + 3 = 6$

88. $\sqrt{x-2} = 14-x$

89. $\sqrt[3]{2x-3} + 1 = 4$

90. $x^{1/3} + 3x^{1/3} = -2$

91. $2n^{-2} - 5n^{-1} = 3$

92. $m^{-3} + 2m^{-2} + m^{-1} = 0$

93. $k^{2/3} - 4k^{1/3} - 5 = 0$

94. $x^{3/4} - 16x^{1/4} = 0$

95. $\sqrt{x+1} + 1 = \sqrt{2x}$

96. $\sqrt{x-2} = 5 - \sqrt{x+3}$

Applications

97. **Allometry** One of the earliest studies in allometry was performed by Bryan Robinson during the eighteenth century. He found that the pulse rate of an animal could be approximated by $f(x) = 1607x^{-0.75}$. The input x is the length of the animal in inches, and the output $f(x)$ is the approximate number of heartbeats per minute. (Source: H. Lancaster, *Quantitative Methods in Biology and Medical Sciences*.)

(a) Use f to estimate the pulse rates of a 2-foot dog and a 5.5-foot person.

(b) What length corresponds to a pulse rate of 400 beats per minute?

98. **Time Spent in Line** Suppose a parking garage attendant can wait on 4 vehicles per minute and vehicles are leaving the ramp randomly at an average rate of x vehicles

per minute. Then the average time T in minutes spent waiting in line and paying the attendant is given by

$$T(x) = \frac{1}{4-x},$$

where $0 \leq x < 4$. (Source: N. Garber and L. Hoel, *Traffic and Highway Engineering*.)

(a) Evaluate $T(2)$ and interpret the result.

(b) Graph T for $0 \leq x < 4$.

(c) What happens to the waiting time as x increases from 0 to (nearly) 4?

(d) Find x if the waiting time is 5 minutes.

99. **Modeling Ocean Temperatures** The formula

$$T(m) = -0.064m^3 + 0.56m^2 + 2.9m + 61$$

approximates the ocean temperature in degrees Fahrenheit at Naples, Florida. In this formula m is the month, with $m = 1$ corresponding to January.

(a) What is the average ocean temperature in May?

(b) Estimate the absolute maximum of T on the closed interval $[1, 12]$ and interpret the result.

100. **Minimizing Surface Area** Find possible dimensions that minimize the surface area of a box with no top that has a volume of 96 cubic inches and a length that is three times the width.

101. **Falling Object** If an object is dropped from a height h , then the time t required for the object to strike the ground is directly proportional to the square root of h . If it requires 1 second for an object to fall 16 feet, how long does it take for an object to fall 256 feet?

102. **Animals and Trotting Speeds** Taller animals tend to take longer, but fewer, steps per second than shorter animals. The relationship between the shoulder height h in meters of an animal and an animal's stepping frequency F in steps per second, while *trotting*, is shown in the table.

h	0.5	1.0	1.5	2.0	2.5
F	2.6	1.8	1.5	1.3	1.2

Source: C. Pennycuik, *Newton Rules Biology*.

(a) Find values for constants a and b so that the formula $f(x) = ax^b$ models the data.

(b) Estimate the stepping frequency for an elephant with a 3-meter shoulder height.

EXTENDED AND DISCOVERY EXERCISES

Exercises 1 and 2: Velocity Suppose that a person is riding a bicycle on a straight road and that $f(t)$ computes the total distance in feet that the rider has traveled after t seconds. To calculate the person's average velocity between time t_1 and time t_2 , we can evaluate the difference quotient

$$\frac{f(t_2) - f(t_1)}{t_2 - t_1}.$$

- (a) For the given $f(t)$ and the indicated values of t_1 and t_2 , calculate the average velocity of the bike rider. Make a table to organize your work.
- (b) Make a conjecture about the velocity of the bike rider precisely at time t_1 .
1. $f(t) = t^2$, $t_1 = 10$
 - (i) $t_2 = 11$
 - (ii) $t_2 = 10.1$
 - (iii) $t_2 = 10.01$
 - (iv) $t_2 = 10.001$
 2. $f(t) = \sqrt{t}$, $t_1 = 4$
 - (i) $t_2 = 5$
 - (ii) $t_2 = 4.1$
 - (iii) $t_2 = 4.01$
 - (iv) $t_2 = 4.001$

Exercises 3–7: Instantaneous Velocity In Exercises 1 and 2 the average velocity of a bike rider was calculated over smaller and smaller time intervals. If we calculate the average velocity as the time interval approaches 0, we say that we are calculating the **instantaneous velocity**. To find the instantaneous velocity, we can calculate the average velocity between times $t_1 = a$ and $t_2 = a + h$. The difference quotient becomes

$$\frac{f(t_2) - f(t_1)}{t_2 - t_1} = \frac{f(a + h) - f(a)}{h}.$$

For example, if $f(t) = t^2$, then

$$\begin{aligned} \frac{f(a + h) - f(a)}{h} &= \frac{(a + h)^2 - a^2}{h} \\ &= 2a + h. \end{aligned}$$

If we let h approach 0 ($h \rightarrow 0$), then the instantaneous velocity becomes $2a + 0 = 2a$ at time $t_1 = a$. For example, if $a = 10$, then $v = 2(10) = 20$ feet per second. Does this result agree with Exercise 1?

- (a) For the given $f(t)$, calculate the difference quotient $\frac{f(a + h) - f(a)}{h}$. Be sure to simplify completely.
- (b) Let h approach 0 and determine a formula for the instantaneous velocity at time $t_1 = a$.
- (c) Calculate the instantaneous velocity at times $a = 5$, 10, and 15.
3. $f(t) = 5t$
 4. $f(t) = t^2 + 2t$
 5. $f(t) = \frac{200}{t}$
 6. $f(t) = t^3$

7. $f(t) = \sqrt{t}$ (Hint: To simplify the ratio, multiply the numerator and denominator by $\sqrt{a + h} + \sqrt{a}$. This procedure is called **rationalizing the numerator**.)

Algebra Review To review rationalizing the denominator, see Chapter R (page R-50).

Exercises 8–11: Average Rates of Change These exercises investigate the relationship between polynomial functions and their average rates of change. For example, the average rate of change of $f(x) = x^2$ from x to $x + 0.001$ for any x can be calculated and graphed as shown in the figures. The graph of f is a parabola, and the graph of its average rate of change is a line. Try to discover what this relationship is by completing the following.

- (a) Graph each function and its average rate of change from x to $x + 0.001$.
- (b) Compare the graphs. How are turning points on the graph of a function related to its average rate of change?
- (c) Generalize your results. Test your generalization.

8. Linear Functions

$$f_1(x) = 3x + 1$$

$$f_3(x) = 1.5x - 5$$

$$f_2(x) = -2x + 6$$

$$f_4(x) = -4x - 2.5$$

9. Quadratic Functions

$$f_1(x) = 2x^2 - 3x + 1$$

$$f_3(x) = x^2 + x - 2$$

$$f_2(x) = -0.5x^2 + 2x + 2$$

$$f_4(x) = -1.5x^2 - 4x + 6$$

10. Cubic Functions

$$f_1(x) = 0.5x^3 - x^2 - 2x + 1$$

$$f_2(x) = -x^3 + x^2 + 3x - 5$$

$$f_3(x) = 2x^3 - 5x^2 + x - 3$$

$$f_4(x) = -x^3 + 3x - 4$$

11. Quartic Functions

$$f_1(x) = 0.05x^4 + 0.2x^3 - x^2 - 2.4x$$

$$f_2(x) = -0.1x^4 + 0.1x^3 + 1.3x^2 - 0.1x - 1.2$$

$$f_3(x) = 0.1x^4 + 0.4x^3 - 0.2x^2 - 2.4x - 2.4$$

1-4 Cumulative Review Exercises

- Find the percent change if a quantity Q changes from 45 to 54.
- Write 0.065 in scientific notation and 7.88×10^5 in standard notation.
- Let $S = \{(-3, 4), (-1, -2), (0, 4), (1, -2), (-1, 5)\}$.
 - Find the domain and range of S .
 - Is S a function?
- Find the exact distance between $(-1, 4)$ and $(3, -9)$.
- Use the graph to express the domain and range of f . Then evaluate $f(0)$.

- Graph $y = g(x)$ by hand.
 - $g(x) = 2 - 3x$
 - $g(x) = |2x - 1|$
 - $g(x) = \frac{1}{2}(x - 2)^2 + 2$
 - $g(x) = x^3 - 1$
 - $g(x) = \sqrt{-x}$
 - $g(x) = \sqrt[3]{x}$
 - $g(x) = \frac{1}{x - 4} + 2$
 - $g(x) = x^2 - x$

Exercises 7 and 8: Complete the following.

- Determine the domain of f .
 - Evaluate $f(2)$.
- $f(x) = \sqrt{x^2 - 4}$
 - $\frac{2x - 3}{3x^2 + 11x - 4}$

- The monthly cost of driving a car is \$200 for maintenance plus \$0.25 a mile. Write a formula for a function C that calculates the monthly cost of driving a car x miles. Evaluate $C(2000)$ and interpret the result.

- The graph of a linear function f is shown.

- Identify the slope, y-intercept, and x-intercept.
 - Write a formula for $f(x)$.
 - Evaluate $f(-3)$ symbolically and graphically.
 - Find any zeros of f .
- Find the average rate of change of $f(x) = x^3 - x$ from $x = -3$ to $x = -2$.
 - Find the difference quotient for $f(x) = x^2 + 6x$.
 - Write the slope-intercept form for a line that passes through $(-2, 5)$ and $(3, -4)$.
 - Write the slope-intercept form for a line that passes through $(-1, 4)$ and is perpendicular to the line $3x - 4y = 12$.
 - Write an equation of a line that is parallel to the x -axis and passes through $(4, -5)$.
 - Determine the x - and y -intercepts on the graph of $5x - 4y = 10$. Graph the equation.
 - If $C(x) = 15x + 2000$ calculates the cost in dollars of producing x radios, interpret the numbers 15 and 2000 in the formula for $C(x)$.
 - Solve $-2.4x - 2.1 = \sqrt{3x} + 1.7$ both graphically and numerically. Round your answer to the nearest tenth.

Exercises 19–30: Solve the equation.

19. $-3(2 - 3x) - (-x - 1) = 1$

20. $\frac{5 - 3x}{6} = \frac{x - (3 - 4x)}{2}$

21. $|3x - 4| + 1 = 5$ 22. $x^3 + 5 = 5x^2 + x$

23. $7x^2 + 9x = 10$ 24. $2x^2 + x + 2 = 0$

25. $2x^3 + 4x^2 = 6x$ 26. $x^4 + 9 = 10x^2$

27. $3x^{2/3} + 5x^{1/3} - 2 = 0$ 28. $\sqrt{5 + 2x} + 4 = x + 5$

29. $\frac{2x - 3}{5 - x} = \frac{4x - 3}{1 - 2x}$ 30. $\sqrt[3]{x - 4} - 1 = 3$

31. Solve $\frac{1}{2}x - (4 - x) + 1 = \frac{3}{2}x - 5$. Is this equation either an identity or a contradiction?32. Graph f . Is f continuous on its domain? Evaluate $f(1)$.

$$f(x) = \begin{cases} x^2 - 1 & \text{if } -3 \leq x \leq -1 \\ x + 1 & \text{if } -1 < x < 1 \\ 1 - x^2 & \text{if } 1 \leq x \leq 3 \end{cases}$$

Exercises 33–38: Solve the inequality.

33. $-\frac{1}{3}x - (1 + x) > \frac{2}{3}x$ 34. $-4 \leq 4x - 6 < \frac{5}{2}$

35. $|5x - 7| \geq 3$ 36. $5x^2 + 13x - 6 < 0$

37. $x^3 - 9x \leq 0$ 38. $\frac{4x - 3}{x + 2} > 0$

39. The graph of a nonlinear function f is shown. Solve each equation or inequality.

(a) $f(x) = 0$ (b) $f(x) > 0$ (c) $f(x) \leq 0$

40. Write the quadratic polynomial $f(x) = 2x^2 - 4x + 1$ in the form $f(x) = a(x - h)^2 + k$.41. Find the vertex on the graph of $f(x) = -\frac{1}{2}x^2 + 3x - 2$.42. Solve $x^2 - 3x = 1$ by completing the square.43. Use the given graph of $y = f(x)$ at the top of the next column to sketch a graph of each equation.

(a) $y = f(x + 2) - 1$

(b) $y = -2f(x)$

(c) $y = f(-x) + 1$

(d) $y = f\left(\frac{1}{2}x\right)$

44. Use transformations of graphs to sketch a graph of $y = 2\sqrt{x + 1}$.45. Use the graph of f to estimate each of the following.(a) Where f is increasing or decreasing(b) The zeros of f

(c) The coordinates of any turning points

(d) Any local extrema

46. Are $f(x) = x^4 - 5x^3 - 7$ and $g(x) = \sqrt{9 - x^2}$ even, odd, or neither?47. Sketch a graph of a quartic (degree 4) function with a negative leading coefficient, three x -intercepts, and three turning points.48. State the end behavior of $f(x) = 4 + 3x - x^3$.

49. Divide each expression.

(a) $\frac{4a^3 - 8a^2 + 12}{4a^2}$ (b) $\frac{2x^3 - 4x + 1}{x - 1}$

(c) $\frac{x^4 + 2x^3 - x^2 + 5x - 2}{x^2 + 2}$

50. A cubic function f has zeros -1 , 0 , and 2 and leading coefficient -5 . Write the complete factored form.
51. A degree 6 function f has zeros -3 , 1 , and 4 with multiplicities 1 , 2 , and 3 , respectively. If the leading coefficient is 4 , write the complete factored form of $f(x)$.
52. A quintic (degree 5) function f with real coefficients has leading coefficient $\frac{1}{2}$ and zeros -2 , i , and $-2i$. Write $f(x)$ in complete factored form and expanded form.
53. Write the complete factored form of the polynomial given by $f(x) = 2x^3 - x^2 - 6x + 3$.
54. Use the graph to write the complete factored form of the cubic polynomial $f(x)$.

55. Write $\frac{3 + 4i}{1 - i}$ in standard form.
56. Find all solutions, real or imaginary, to $x^4 - 25 = 0$.
57. State the domain of $f(x) = \frac{2x - 5}{x^2 - 3x - 4}$. Find any vertical or horizontal asymptotes.
58. Write $\sqrt[3]{x^5}$ using rational exponents. Evaluate the expression for $x = 8$.

Applications

59. **Water in a Pool** The graph shows the amount of water in a swimming pool x hours past noon. Find the slope of each line segment and interpret each slope.

60. **Distance** At noon, one runner is heading south at 8 miles per hour and is located 2 miles north of a second runner, who is heading west at 7 miles per hour. Approximate the distance between the runners to the nearest tenth of a mile at 12:30 P.M.
61. **Average Rate of Change** The total distance D in feet traveled by a car after t seconds is given by $D(t) = 4t^2$ for $0 \leq t \leq 7$. Find the average rate of change of D from 0 to 2 and 2 to 4. Interpret these average rates of change.
62. **Working Together** Suppose one person can paint a room in 10 hours and another person can paint the same room in 8 hours. How long will it take to paint the room if they work together?
63. **Mixing Acid** Two liters of a 35% sulfuric acid solution need to be diluted to a 20% solution. How many liters of a 12% sulfuric acid solution should be mixed with the 2-liter solution?
64. **U.S. Population** In 1990 the population of the United States was about 250 million, and in 2000 it was about 280 million. (Source: Bureau of the Census.)
 (a) Find a linear function P that models the data during year t .
 (b) Estimate the year when the population of the United States reached 300 million.
65. **Maximizing Revenue** The revenue R in dollars from selling x thousand toy figures is given by the formula $R(x) = x(800 - x)$. How many toy figures should be sold to maximize revenue?
66. **Construction** A box is being constructed by cutting 2-inch squares from the corners of a rectangular sheet of metal that is 6 inches longer than it is wide. If the box is to have a volume of 270 cubic inches, find the dimensions of the metal sheet.
67. **Group Rates** Round-trip airline tickets to Hawaii are regularly \$800, but for each additional ticket purchased the price is reduced by \$5. For example, 1 ticket costs \$800, 2 tickets cost $2(795) = \$1590$, and 3 tickets cost $3(790) = \$2370$.
 (a) Write a quadratic function C that gives the total cost of purchasing t tickets.
 (b) Solve $C(t) = 17,000$ and interpret the result.
 (c) Find the absolute maximum for C and interpret your result. Assume that t must be an integer.

68. **Modeling Data** Find a quadratic function in the form $f(x) = a(x - h)^2 + k$ that models the data in the table. Graph $y = f(x)$ and the data if a graphing calculator is available.

x	4	6	8	10
y	6	15	37	80

69. **Health Care Cost** Average health care cost per employee has risen dramatically since 1998. The table lists the annual percent change from 1998 to 2002.

Year	1998	1999	2000	2001	2002
Increase (%)	6.1	7.3	8.1	11.2	14.7

Source: Mercer U.S. Health Care Survey, 2002.

- (a) Find a polynomial function that models these data. (Answers may vary.)
- (b) Estimate the annual percent change in 2004.

70. **Americans and Weight** The percentage of Americans who are 30 or more pounds above a healthy weight has increased during the past 40 years. The table lists this percentage for various years.

Year	1961	1978	1991	2000
Percentage	13	15	23	31

Source: National Health and Nutrition Examination Survey.

- (a) Find a polynomial function that models these data. (Answers may vary.)
- (b) Estimate the year when this percentage may reach 40%. Compare your prediction with the experts' prediction of 2009.

71. **Minimizing Surface Area** A cylindrical can is being constructed to have a volume of 10π cubic inches. Find the dimensions of the can that result in the least amount of aluminum being used in its construction.

Exponential and Logarithmic Functions

5

In 1900 the population of the world was approximately 1.6 billion. At that time the Swedish scientist Svante Arrhenius first predicted a greenhouse effect resulting from emissions of carbon dioxide by the industrialized countries. His classic calculation, which made use of logarithms, predicted that a doubling of the carbon dioxide concentration in the atmosphere would raise the average global temperature by 7°F to 11°F . Since then, the world population has increased dramatically to approximately 6.7 billion. With this increase in population, there has been a corresponding increase in emissions of greenhouse gases. As a result, there is more discussion today than ever about the impact and causes of global warming.

When quantities such as population and pollution increase rapidly, nonlinear functions and equations are used to model their growth. In this chapter, exponential and logarithmic functions are introduced. They occur in a wide variety of applications. Examples include acid rain, the decline of the bluefin tuna, air pollution, global warming, salinity of the ocean, demand for organ transplants, diversity of bird species, the relationship between caloric intake and land ownership in developing countries, hurricanes, earthquakes, and increases in skin cancer due to a decrease in the ozone layer. Understanding these issues and discovering solutions will require creativity, innovation, and mathematics. This chapter presents some of the mathematical tools necessary for modeling these trends.

*The important thing is not to
stop questioning.*

—Albert Einstein

5.1 Combining Functions

- Perform arithmetic operations on functions
- Review function notation
- Perform composition of functions

Introduction

Addition, subtraction, multiplication, and division can be performed on numbers and variables. These arithmetic operations can also be used to combine functions. For example, to model the stopping distance of a car, we compute two quantities. The first quantity is the *reaction distance*, which is the distance that a car travels between the time when a driver first recognizes a hazard and the time when the brakes are applied. The second quantity is the *braking distance*, which is the distance that a car travels after the brakes have been applied. *Stopping distance* is equal to the sum of the reaction distance and the braking distance. One way to determine stopping distance is to find one function that models the reaction distance and a second function that calculates the braking distance. The stopping distance is then found by adding the two functions.

Arithmetic Operations on Functions

Highway engineers frequently assume that drivers have a reaction time of 2.5 seconds or less. During this time, a car continues to travel at a constant speed, until the driver is able to move his or her foot from the accelerator to the brake pedal. If a car is traveling at x miles per hour, then $r(x) = \left(\frac{11}{3}\right)x$ computes the distance in feet that the car travels in 2.5 seconds. For example, a driver traveling at 55 miles per hour might have a reaction distance of $r(55) = \left(\frac{11}{3}\right)(55) \approx 201.7$ feet.

The braking distance in feet for a car traveling on wet level pavement at x miles per hour can be approximated by $b(x) = x^2/9$. For instance, a car traveling at 55 miles per hour would need $b(55) = 55^2/9 \approx 336.1$ feet to stop after the brakes have been applied. The estimated stopping distance s at 55 miles per hour is the sum of these distances: $201.7 + 336.1 = 537.8$ feet. See Figure 5.1. (Source: L. Haefner, *Introduction to Transportation Systems*.)

Figure 5.1 $s(x) = r(x) + b(x)$

The concept of finding the sum of two functions can be represented symbolically, graphically, and numerically, as illustrated in the next example.

EXAMPLE 1 Representing stopping distance

A driver with a reaction time of 2.5 seconds traveling at 60 miles per hour attempts to stop on wet level pavement in order to avoid an accident.

- (a) Write a symbolic representation for a function s using r and b that computes the stopping distance for a car traveling at x miles per hour. Evaluate $s(60)$.

- (b) Graph r , b , and s . Interpret the graph.
 (c) Illustrate the relationship among r , b , and s numerically.

SOLUTION

- (a) **Symbolic Representation** Let $s(x)$ be the sum of the two formulas for r and b .

$$s(x) = r(x) + b(x) = \frac{11}{3}x + \frac{1}{9}x^2$$

The stopping distance for a car traveling at 60 miles per hour is

$$s(60) = \frac{11}{3}(60) + \frac{1}{9}(60)^2 = 620 \text{ feet.}$$

- (b) **Graphical Representation** Graph $y_1 = \frac{11}{3}x$, $y_2 = \frac{1}{9}x^2$, and $y_3 = \frac{11}{3}x + \frac{1}{9}x^2$ on the same axes, as shown in Figure 5.2. For any x -value in the graph, the sum of y_1 and y_2 equals y_3 . Figure 5.2 illustrates that

$$s(60) = r(60) + b(60) = 220 + 400 = 620.$$

- (c) **Numerical Representation** Table 5.1 shows numerical representations of $r(x)$, $b(x)$, and $s(x) = r(x) + b(x)$. Notice that values for $s(x)$ can be found by adding $r(x)$ and $b(x)$. For example, when $x = 60$, $r(60) = 220$ and $b(60) = 400$. It follows that $s(60) = 220 + 400 = 620$.

Figure 5.2

Table 5.1

x	0	12	24	36	48	60	← Speed
$r(x)$	0	44	88	132	176	220	← Reaction distance
$b(x)$	0	16	64	144	256	400	← Braking distance
$s(x)$	0	60	152	276	432	620	← Stopping distance: $s(x) = r(x) + b(x)$

Now Try Exercise 99 ◀

We now formally define arithmetic operations on functions.

Operations on Functions

If $f(x)$ and $g(x)$ both exist, the sum, difference, product, and quotient of two functions f and g are defined by

$$(f + g)(x) = f(x) + g(x),$$

$$(f - g)(x) = f(x) - g(x),$$

$$(fg)(x) = f(x) \cdot g(x), \text{ and}$$

$$\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)}, \text{ where } g(x) \neq 0.$$

Operations on Functions and Domains The domains of the sum, difference, and product of f and g include x -values that are in *both* the domain of f and the domain of g . The domain of the quotient f/g includes all x -values in both the domain of f and the domain of g , where $g(x) \neq 0$.

EXAMPLE 2 Performing arithmetic operations on functions symbolically

Let $f(x) = 2 + \sqrt{x-1}$ and $g(x) = x^2 - 4$.

- (a) Find the domains of $f(x)$ and $g(x)$. Then find the domains of $(f+g)(x)$, $(f-g)(x)$, $(fg)(x)$, and $(f/g)(x)$.
 (b) If possible, evaluate $(f+g)(5)$, $(f-g)(1)$, $(fg)(0)$, and $(f/g)(3)$.
 (c) Write expressions for $(f+g)(x)$, $(f-g)(x)$, $(fg)(x)$, and $(f/g)(x)$.

SOLUTION

- (a) Whenever $x \geq 1$, $f(x) = 2 + \sqrt{x-1}$ is defined. Therefore the domain of f is $\{x|x \geq 1\}$. The domain of $g(x) = x^2 - 4$ is all real numbers. The domains of $f+g$, $f-g$, and fg include all x -values in *both* the domain of f and the domain of g . Thus their domains are $\{x|x \geq 1\}$.

To determine the domain of f/g , we must also exclude x -values for which $g(x) = x^2 - 4 = 0$. This occurs when $x = \pm 2$. Thus the domain of f/g is $\{x|x \geq 1, x \neq 2\}$. (Note that $x \neq -2$ is satisfied if $x \geq 1$.)

- (b) The expressions can be evaluated as follows.

$$(f+g)(5) = f(5) + g(5) = (2 + \sqrt{5-1}) + (5^2 - 4) = 4 + 21 = 25$$

$$(f-g)(1) = f(1) - g(1) = (2 + \sqrt{1-1}) - (1^2 - 4) = 2 - (-3) = 5$$

$(fg)(0)$ is undefined, since 0 is not in the domain of $f(x)$. $(f/g)(3)$ equals

$$\frac{f(3)}{g(3)} = \frac{2 + \sqrt{3-1}}{3^2 - 4} = \frac{2 + \sqrt{2}}{5}.$$

- (c) The sum, difference, product, and quotient of f and g are calculated as follows.

$$(f+g)(x) = f(x) + g(x) = (2 + \sqrt{x-1}) + (x^2 - 4) = \sqrt{x-1} + x^2 - 2$$

$$(f-g)(x) = f(x) - g(x) = (2 + \sqrt{x-1}) - (x^2 - 4) = \sqrt{x-1} - x^2 + 6$$

$$(fg)(x) = f(x) \cdot g(x) = (2 + \sqrt{x-1})(x^2 - 4)$$

$$\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)} = \frac{2 + \sqrt{x-1}}{x^2 - 4}$$

Now Try Exercises 9 and 15 ◀

Graphical, Numerical, and Symbolic Evaluation In the next example, we evaluate operations on functions in three ways.

EXAMPLE 3 Evaluating combinations of functions

If possible, use each representation of f and g to evaluate $(f+g)(4)$, $(f-g)(-2)$, $(fg)(1)$, and $(f/g)(0)$.

(a)

(b)

x	-2	0	1	4
$f(x)$	-3	1	3	9
x	-2	0	1	4
$g(x)$	—	0	1	2

- (c) $f(x) = 2x + 1$, $g(x) = \sqrt{x}$

SOLUTION

- (a) **Graphical Evaluation** From the graph, $f(4) = 9$ and $g(4) = 2$. Thus

$$(f + g)(4) = f(4) + g(4) = 9 + 2 = 11.$$

Although $f(-2) = -3$, $g(-2)$ is undefined because -2 is not in the domain of g . Thus $(f - g)(-2)$ is undefined. The domains of f and g include 1, and it follows that $(fg)(1) = f(1)g(1) = 3(1) = 3$. The graph of g intersects the origin, so $g(0) = 0$. Thus $(f/g)(0) = \frac{f(0)}{g(0)}$ is undefined.

- (b) **Numerical Evaluation** From the tables, $f(4) = 9$ and $g(4) = 2$. As in part (a),

$$(f + g)(4) = f(4) + g(4) = 9 + 2 = 11.$$

A dash in the table indicates that $g(-2)$ is undefined, so $(f - g)(-2)$ is also undefined. The calculations of $(fg)(1)$ and $(f/g)(0)$ are done in a similar manner.

- (c) **Symbolic Evaluation** Use the formulas $f(x) = 2x + 1$ and $g(x) = \sqrt{x}$.

$$(f + g)(4) = f(4) + g(4) = (2 \cdot 4 + 1) + \sqrt{4} = 9 + 2 = 11$$

$$(f - g)(-2) = f(-2) - g(-2) = (2 \cdot (-2) + 1) - \sqrt{-2} \text{ is undefined.}$$

$$(fg)(1) = f(1)g(1) = (2 \cdot 1 + 1)\sqrt{1} = 3(1) = 3$$

$$\left(\frac{f}{g}\right)(0) = \frac{f(0)}{g(0)} \text{ is undefined, since } g(0) = 0.$$

Now Try Exercises 7, 31, and 35 ◀

An Application The next example is an application from business involving the difference between two functions.

EXAMPLE 4 Finding the difference of two functions

Once the sound track for a DVD has been recorded, the cost of producing the master disc can be significant. After this disc has been made, additional discs can be produced inexpensively. A typical cost for producing the master disc is \$2000, while additional discs cost approximately \$2 each. (Source: Windcrest Productions.)

- Assuming no other expenses, find a function C that outputs the cost of producing the master disc plus x additional DVDs. Find the cost of making the master disc and 1500 additional DVDs.
- Suppose that each DVD is sold for \$12. Find a function R that computes the revenue from selling x DVDs. Find the revenue from selling 1500 DVDs.
- Assuming that the master disc is not sold, determine a function P that outputs the profit from selling x DVDs. How much profit is there from selling 1500 DVDs?

SOLUTION

- (a) The cost of producing the master disc for \$2000 plus x additional discs at \$2 each is given by $C(x) = 2x + 2000$. The \$2000 cost is sometimes called a *fixed cost*. The cost of manufacturing the master disc and 1500 additional DVDs is

$$C(1500) = 2(1500) + 2000 = \$5000.$$

- (b) The revenue from x discs at \$12 each is computed by $R(x) = 12x$. The revenue from selling 1500 DVDs is $R(1500) = 12(1500) = \$18,000$.

Algebra Review

To review arithmetic operations on polynomials, see Chapter R (page R-13).

(c) Profit P is equal to revenue minus cost. This can be written using function notation.

$$\begin{aligned} P(x) &= R(x) - C(x) \\ &= 12x - (2x + 2000) \\ &= 12x - 2x - 2000 \\ &= 10x - 2000 \end{aligned}$$

$$\text{If } x = 1500, P(1500) = 10(1500) - 2000 = \$13,000.$$

Now Try Exercise 95 ◀

Review of Function Notation

In the next example, we review how to evaluate function notation before we discuss composition of functions.

EXAMPLE 5 Evaluating function notation

Let $g(x) = 3x^2 - 6x + 2$. Evaluate each expression.

- (a) $g(2)$ (b) $g(k)$ (c) $g(x^2)$ (d) $g(x + 2)$

SOLUTION

$$(a) \quad g(2) = 3(2)^2 - 6(2) + 2 = 12 - 12 + 2 = 2$$

$$(b) \quad g(k) = 3k^2 - 6k + 2$$

$$(c) \quad g(x^2) = 3(x^2)^2 - 6(x^2) + 2 = 3x^4 - 6x^2 + 2$$

$$\begin{aligned} (d) \quad g(x + 2) &= 3(x + 2)^2 - 6(x + 2) + 2 \\ &= 3(x^2 + 4x + 4) - 6(x + 2) + 2 \\ &= 3x^2 + 12x + 12 - 6x - 12 + 2 \\ &= 3x^2 + 6x + 2 \end{aligned}$$

Now Try Exercise 45 ◀

Algebra Review

To review squaring a binomial, see Chapter R (page R-18).

**Composition of Functions**

Many tasks in life are performed in sequence. For example, to go to a movie we might get into a car, drive to the movie theater, and get out of the car. A similar situation occurs with functions. For example, to convert miles to inches we might first convert miles to feet and then convert feet to inches. Since there are 5280 feet in a mile, $f(x) = 5280x$ converts x miles to an equivalent number of feet. Then $g(x) = 12x$ changes feet to inches. To convert x miles to inches, we combine the functions f and g in sequence. Figure 5.3 illustrates how to convert 5 miles to inches. First, $f(5) = 5280(5) = 26,400$. Then the output of 26,400 feet from f is used as input for g . The number of inches in 26,400 feet is $g(26,400) = 12(26,400) = 316,800$. This computation is called the *composition* of g and f .

The composition of g and f shown in Figure 5.3 can be expressed symbolically. The symbol \circ is used to denote composition of two functions.

$$\begin{aligned} (g \circ f)(5) &= g(f(5)) && \text{First compute } f(5). \\ &= g(5280 \cdot 5) && f(x) = 5280x \\ &= g(26,400) && \text{Simplify.} \\ &= 12(26,400) && g(x) = 12x \\ &= 316,800 && \text{Simplify.} \end{aligned}$$

Figure 5.3

A distance of 5 miles is equivalent to 316,800 inches. The concept of composition of two functions is now defined formally.

Composition of Functions

If f and g are functions, then the **composite function** $g \circ f$, or **composition** of g and f is defined by

$$(g \circ f)(x) = g(f(x)).$$

We read $g(f(x))$ as “ g of f of x .”

The domain of $g \circ f$ is all x in the domain of f such that $f(x)$ is in the domain of g .

Symbolic Evaluation of Composite Functions The next three examples discuss how to evaluate composite functions and find their domains symbolically.

EXAMPLE 5 Finding a symbolic representation of a composite function

Find a formula for the composite function $g \circ f$ that converts x miles into inches.

SOLUTION Let $f(x) = 5280x$ and $g(x) = 12x$.

$$\begin{aligned}(g \circ f)(x) &= g(f(x)) && \text{Definition of composition} \\ &= g(5280x) && f(x) = 5280x \text{ is the input for } g. \\ &= 12(5280x) && g \text{ multiplies the input by } 12. \\ &= 63,360x && \text{Simplify.}\end{aligned}$$

Thus $(g \circ f)(x) = 63,360x$ converts x miles to inches.

Now Try Exercise 97 ◀

NOTE Converting units is only one application of composition of functions. Another application involves examining how a decrease in the ozone layer causes an increase in ultraviolet sunlight, which in turn causes increases in the number of skin cancer cases. See Example 10.

MAKING CONNECTIONS

Product and Composition of Two Functions Computing a product of two functions is fundamentally different from computing a composition of two functions. With the product $(fg)(x) = f(x) \cdot g(x)$, both f and g receive the same input x . Then their outputs are multiplied. However, with the composition $(f \circ g)(x) = f(g(x))$, the output $g(x)$ provides the input for f . These concepts are illustrated in Figure 5.4.

Figure 5.4 Comparison of Multiplication and Composition

EXAMPLE 1 Evaluating a composite function symbolically

Let $f(x) = x^2 + 3x + 2$ and $g(x) = \frac{1}{x}$.

- (a) Evaluate $(f \circ g)(2)$ and $(g \circ f)(2)$. How do they compare?
 (b) Find the composite functions defined by $(f \circ g)(x)$ and $(g \circ f)(x)$. Are they equivalent expressions?
 (c) Find the domains of $(f \circ g)(x)$ and $(g \circ f)(x)$.

SOLUTION

$$\begin{aligned} \text{(a)} \quad (f \circ g)(2) &= f(g(2)) = f\left(\frac{1}{2}\right) = \left(\frac{1}{2}\right)^2 + 3\left(\frac{1}{2}\right) + 2 = \frac{15}{4} = 3.75 \\ (g \circ f)(2) &= g(f(2)) = g(2^2 + 3 \cdot 2 + 2) = g(12) = \frac{1}{12} \approx 0.0833 \end{aligned}$$

The results are not equal.

$$\begin{aligned} \text{(b)} \quad (f \circ g)(x) &= f(g(x)) = f\left(\frac{1}{x}\right) = \left(\frac{1}{x}\right)^2 + 3\left(\frac{1}{x}\right) + 2 = \frac{1}{x^2} + \frac{3}{x} + 2 \\ (g \circ f)(x) &= g(f(x)) = g(x^2 + 3x + 2) = \frac{1}{x^2 + 3x + 2} \end{aligned}$$

The expressions for $(f \circ g)(x)$ and $(g \circ f)(x)$ are not equivalent.

- (c) The domain of f is all real numbers, and the domain of g is $\{x \mid x \neq 0\}$. The domain of $(f \circ g)(x) = f(g(x))$ consists of all x in the domain of g such that $g(x)$ is in the domain of f . Thus the domain of $(f \circ g)(x) = \frac{1}{x^2} + \frac{3}{x} + 2$ is $\{x \mid x \neq 0\}$.

The domain of $(g \circ f)(x) = g(f(x))$ consists of all x in the domain of f such that $f(x)$ is in the domain of g . Since $x^2 + 3x + 2 = 0$ when $x = -1$ or $x = -2$, the domain of $(g \circ f)(x) = \frac{1}{x^2 + 3x + 2}$ is $\{x \mid x \neq -1, x \neq -2\}$.

Now Try Exercises 53 and 57 ◀

MAKING CONNECTIONS

Composition and Domains To find the domain of a composition of two functions, it is sometimes helpful not to immediately simplify the resulting expression. For example, if $f(x) = x^2$ and $g(x) = \sqrt{x-1}$, then

$$(f \circ g)(x) = (\sqrt{x-1})^2.$$

From this unsimplified expression, we can see that the domain (input) of $f \circ g$ must be restricted to $x \geq 1$ for the output to be a real number. As a result,

$$(f \circ g)(x) = x - 1, \quad x \geq 1.$$

EXAMPLE 2 Finding symbolic representations for composite functions

Find $(f \circ g)(x)$ and $(g \circ f)(x)$.

- (a) $f(x) = x + 2, \quad g(x) = x^3 - 2x^2 - 1$
 (b) $f(x) = \sqrt{2x}, \quad g(x) = \frac{1}{x+1}$
 (c) $f(x) = 2x - 3, \quad g(x) = x^2 + 5$

SOLUTION

Getting Started When simplifying a composition of functions, the first step is often to write $(f \circ g)(x) = f(g(x))$ or $(g \circ f)(x) = g(f(x))$. ▶

- (a) Begin by writing $(f \circ g)(x) = f(g(x)) = f(x^3 - 2x^2 - 1)$. Function f adds 2 to the input. That is, $f(\text{input}) = (\text{input}) + 2$ because $f(x) = x + 2$. Thus

$$f(x^3 - 2x^2 - 1) = (x^3 - 2x^2 - 1) + 2 = x^3 - 2x^2 + 1.$$

To find $(g \circ f)(x)$, begin by writing $(g \circ f)(x) = g(f(x)) = g(x + 2)$. Function g does the following to its input: $g(\text{input}) = (\text{input})^3 - 2(\text{input})^2 - 1$. Thus

$$g(x + 2) = (x + 2)^3 - 2(x + 2)^2 - 1.$$

$$(b) (f \circ g)(x) = f(g(x)) = f\left(\frac{1}{x+1}\right) = \sqrt{2 \cdot \frac{1}{x+1}} = \sqrt{\frac{2}{x+1}}$$

$$(g \circ f)(x) = g(f(x)) = g(\sqrt{2x}) = \frac{1}{\sqrt{2x} + 1}$$

$$(c) (f \circ g)(x) = f(g(x)) = f(x^2 + 5) = 2(x^2 + 5) - 3 = 2x^2 + 7$$

$$(g \circ f)(x) = g(f(x)) = g(2x - 3) = (2x - 3)^2 + 5 = 4x^2 - 12x + 14$$

Now Try Exercises 59, 63, and 65 ◀

Graphical Evaluation of Composite Functions The next example shows how to evaluate a composition of functions graphically.

EXAMPLE 9 Evaluating a composite function graphically

Use the graphs of f and g shown in Figure 5.5 to evaluate each expression.

- (a) $(f \circ g)(2)$ (b) $(g \circ f)(-3)$ (c) $(f \circ f)(-3)$

SOLUTION

- (a) Because $(f \circ g)(2) = f(g(2))$, first evaluate $g(2)$. From Figure 5.6, $g(2) = 1$ and

$$(f \circ g)(2) = f(g(2)) = f(1).$$

To complete the evaluation of $(f \circ g)(2)$, use Figure 5.7 to determine that $f(1) = 3$. Thus $(f \circ g)(2) = 3$.

- (b) Because $(g \circ f)(-3) = g(f(-3))$, first evaluate the expression $f(-3)$. Figure 5.8 shows that $f(-3) = -1$, so

$$(g \circ f)(-3) = g(f(-3)) = g(-1).$$

From Figure 5.9, $g(-1) = -2$. Thus $(g \circ f)(-3) = -2$.

- (c) Similarly, $(f \circ f)(-3) = f(f(-3)) = f(-1) = 1$.

Figure 5.5

Figure 5.6 $g(2) = 1$

Figure 5.7 $f(1) = 3$

Figure 5.8 $f(-3) = -1$

Figure 5.9 $g(-1) = -2$

Now Try Exercise 75 ◀

Numerical Evaluation of Composite Functions Tables 5.2 and 5.3 are numerical representations of functions f and g .

Table 5.2

x	1	2	3	4
$f(x)$	2	3	4	1

Table 5.3

x	1	2	3	4
$g(x)$	4	3	2	1

We can use these tables to evaluate $g \circ f$ and $f \circ g$. For example, $(g \circ f)(3)$ can be evaluated as follows.

$$\begin{aligned}(g \circ f)(3) &= g(f(3)) \\ &= g(4) \\ &= 1\end{aligned}$$

Definition of composition

$f(3) = 4$ in Table 5.2

$g(4) = 1$ in Table 5.3

Also, we can find that $(f \circ g)(3) = f(g(3)) = f(2) = 3$ by using Table 5.3 and then Table 5.2.

NOTE Composition of functions is *not* commutative. That is, $(g \circ f)(x) \neq (f \circ g)(x)$ in general. For example, from above, $(g \circ f)(3) \neq (f \circ g)(3)$.

An Application The next example illustrates how composition of functions occurs in the analysis of the ozone layer, ultraviolet (UV) radiation, and cases of skin cancer.

EXAMPLE 6 Evaluating a composite function numerically

Depletion of the ozone layer has caused an increase in the amount of UV radiation reaching the surface of the earth. An increase in UV radiation is associated with skin cancer. In Table 5.4 the function f computes the approximate percent *increase* in UV radiation resulting from an x percent *decrease* in the thickness of the ozone layer. The function g shown in Table 5.5 computes the expected percent increase in cases of skin cancer resulting from an x percent increase in UV radiation. (Source: R. Turner, D. Pearce, and I. Bateman, *Environmental Economics*.)

Table 5.4 Percent Increase in UV Radiation

x	0	1	2	3	4	5	6
$f(x)$	0	1.5	3.0	4.5	6.0	7.5	9.0

Percent decrease in the ozone layer

Percent increase in UV radiation

Table 5.5 Percent Increase in Skin Cancer

x	0	1.5	3.0	4.5	6.0	7.5	9.0
$g(x)$	0	5.25	10.5	15.75	21.0	26.25	31.5

Percent increase in UV radiation

Percent increase in cases of skin cancer

- (a) Find $(g \circ f)(2)$ and interpret this calculation.
- (b) Create a table for $g \circ f$. Describe what $(g \circ f)(x)$ computes.

SOLUTION

- (a) $(g \circ f)(2) = g(f(2)) = g(3.0) = 10.5$. This means that a 2% decrease in the thickness of the ozone layer results in a 3% increase in UV radiation, which could cause a 10.5% increase in skin cancer.

(b) The values for $(g \circ f)(x)$ can be found in a similar manner. See Table 5.6.

Table 5.6

x	0	1	2	3	4	5	6	Percent decrease in the ozone layer
$(g \circ f)(x)$	0	5.25	10.5	15.75	21.0	26.25	31.5	Percent increase in cases of skin cancer

The composition $(g \circ f)(x)$ computes the percent increase in cases of skin cancer resulting from an x percent decrease in the ozone layer.

Now Try Exercise 101 ◀

Writing Compositions When you are solving problems, it is sometimes helpful to recognize a function as the composition of two simpler functions. For example, $h(x) = \sqrt[3]{x^2}$ can be thought of as the composition of the cube root function, $g(x) = \sqrt[3]{x}$, and the squaring function, $f(x) = x^2$. Then h can be written as $h(x) = g(f(x)) = \sqrt[3]{x^2}$. This concept is demonstrated in the next example. Note that answers may vary.

EXAMPLE 11 Writing a function as a composition of two functions

Find functions f and g so that $h(x) = (g \circ f)(x)$.

(a) $h(x) = (x + 3)^2$ (b) $h(x) = \sqrt{2x - 7}$ (c) $h(x) = \frac{1}{x^2 + 2x}$

SOLUTION

(a) Let $f(x) = x + 3$ and $g(x) = x^2$. Then

$$(g \circ f)(x) = g(f(x)) = g(x + 3) = (x + 3)^2.$$

(b) Let $f(x) = 2x - 7$ and $g(x) = \sqrt{x}$. Then

$$(g \circ f)(x) = g(f(x)) = g(2x - 7) = \sqrt{2x - 7}.$$

(c) Let $f(x) = x^2 + 2x$ and $g(x) = \frac{1}{x}$. Then

$$(g \circ f)(x) = g(f(x)) = g(x^2 + 2x) = \frac{1}{x^2 + 2x}.$$

Now Try Exercises 81, 85, and 91 ◀

5.1 Putting It All Together

Addition, subtraction, multiplication, and division can be used to combine functions. Composition of functions is another way to combine functions, and it is fundamentally different from arithmetic operations on functions. In the composition $(g \circ f)(x)$, the *output* $f(x)$ is used as *input* for g .

The following table summarizes some concepts involved with combining functions.

continued from previous page

Concept	Notation	Examples
Sum of two functions	$(f + g)(x) = f(x) + g(x)$	$f(x) = x^2, g(x) = 2x + 1$ $(f + g)(3) = f(3) + g(3) = 9 + 7 = 16$ $(f + g)(x) = f(x) + g(x) = x^2 + 2x + 1$
Difference of two functions	$(f - g)(x) = f(x) - g(x)$	$f(x) = 3x, g(x) = 2x + 1$ $(f - g)(1) = f(1) - g(1) = 3 - 3 = 0$ $(f - g)(x) = f(x) - g(x) = 3x - (2x + 1) = x - 1$
Product of two functions	$(fg)(x) = f(x) \cdot g(x)$	$f(x) = x^3, g(x) = 1 - 3x$ $(fg)(-2) = f(-2) \cdot g(-2) = (-8)(7) = -56$ $(fg)(x) = f(x) \cdot g(x) = x^3(1 - 3x) = x^3 - 3x^4$
Quotient of two functions	$\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)}, g(x) \neq 0$	$f(x) = x^2 - 1, g(x) = x + 2$ $\left(\frac{f}{g}\right)(2) = \frac{f(2)}{g(2)} = \frac{3}{4}$ $\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)} = \frac{x^2 - 1}{x + 2}, x \neq -2$
Composition of two functions	$(g \circ f)(x) = g(f(x))$	$f(x) = x^3, g(x) = x^2 - 2x + 1$ $(g \circ f)(2) = g(f(2)) = g(8) = 64 - 16 + 1 = 49$ $(g \circ f)(x) = g(f(x)) = g(x^3) = (x^3)^2 - 2(x^3) + 1 = x^6 - 2x^3 + 1$

5.1 Exercises

Concepts

- If $f(3) = 2$ and $g(3) = 5$, $(f + g)(3) = \underline{\hspace{2cm}}$.
- If $f(3) = 2$ and $g(2) = 5$, $(g \circ f)(3) = \underline{\hspace{2cm}}$.
- If $f(x) = x^2$ and $g(x) = 4x$, $(fg)(x) = \underline{\hspace{2cm}}$.
- If $f(x) = x^2$ and $g(x) = 4x$, $(f \circ g)(x) = \underline{\hspace{2cm}}$.
- Cost of Carpet** If $f(x)$ calculates the number of square feet in x square yards and $g(x)$ calculates the cost in dollars of x square feet of carpet, what does $(g \circ f)$ calculate?

- Time Conversion** If $f(x)$ calculates the number of days in x hours and $g(x)$ calculates the number of years in x days, what does $(g \circ f)$ calculate?

Arithmetic Operations on Functions

Exercises 7–10: Use $f(x)$ and $g(x)$ to evaluate each expression symbolically.

- $f(x) = 2x - 3, g(x) = 1 - x^2$
 - $(f + g)(3)$
 - $(f - g)(-1)$
 - $(fg)(0)$
 - $(f/g)(2)$

8. $f(x) = 4x - x^3, g(x) = x + 3$

(a) $(g + g)(-2)$ (b) $(f - g)(0)$

(c) $(gf)(1)$ (d) $(g/f)(-3)$

9. $f(x) = 2x + 1, g(x) = \frac{1}{x}$

(a) $(f + g)(2)$ (b) $(f - g)(\frac{1}{2})$

(c) $(fg)(4)$ (d) $(f/g)(0)$

10. $f(x) = \sqrt[3]{x^2}, g(x) = |x - 3|$

(a) $(f + g)(-8)$ (b) $(f - g)(-1)$

(c) $(fg)(0)$ (d) $(f/g)(27)$

Exercises 11–30: Use $f(x)$ and $g(x)$ to find a formula for each expression. Identify its domain.

(a) $(f + g)(x)$ (b) $(f - g)(x)$

(c) $(fg)(x)$ (d) $(f/g)(x)$

11. $f(x) = 2x, g(x) = x^2$

12. $f(x) = 1 - 4x, g(x) = 3x + 1$

13. $f(x) = x^2 - 1, g(x) = x^2 + 1$

14. $f(x) = 4x^3 - 8x^2, g(x) = 4x^2$

15. $f(x) = x - \sqrt{x - 1}, g(x) = x + \sqrt{x - 1}$

16. $f(x) = 3 + \sqrt{2x + 9}, g(x) = 3 - \sqrt{2x + 9}$

17. $f(x) = \sqrt{x} - 1, g(x) = \sqrt{x} + 1$

18. $f(x) = \sqrt{1 - x}, g(x) = x^3$

19. $f(x) = \frac{1}{x + 1}, g(x) = \frac{3}{x + 1}$

20. $f(x) = x^{1/2}, g(x) = 3$

21. $f(x) = \frac{1}{2x - 4}, g(x) = \frac{x}{2x - 4}$

22. $f(x) = \frac{1}{x}, g(x) = x^3$

23. $f(x) = x^2 - 1, g(x) = |x + 1|$

24. $f(x) = |2x - 1|, g(x) = |2x + 1|$

25. $f(x) = \frac{x^2 - 3x + 2}{x + 1}, g(x) = \frac{x^2 - 1}{x - 2}$

26. $f(x) = \frac{4x - 2}{x + 2}, g(x) = \frac{2x - 1}{3x + 6}$

27. $f(x) = \frac{2}{x^2 - 1}, g(x) = \frac{x + 1}{x^2 - 2x + 1}$

28. $f(x) = \frac{1}{x + 2}, g(x) = x^2 + x - 2$

29. $f(x) = x^{5/2} - x^{3/2}, g(x) = x^{1/2}$

30. $f(x) = x^{2/3} - 2x^{1/3} + 1, g(x) = x^{1/3} - 1$

Exercises 31–34: Use the graph to evaluate each expression.

31.

(a) $(f + g)(2)$

(b) $(f - g)(1)$

(c) $(fg)(0)$

(d) $(f/g)(1)$

40. Use the table in Exercise 38 to complete the table in Exercise 39.

Review of Function Notation

Exercises 41–52: For the given $g(x)$, evaluate each of the following.

$$(a) g(-3) \quad (b) g(b) \quad (c) g(x^3) \quad (d) g(2x - 3)$$

$$41. g(x) = 2x + 1 \quad 42. g(x) = 5 - \frac{1}{2}x$$

$$43. g(x) = 2(x + 3)^2 - 4 \quad 44. g(x) = -(x - 1)^2$$

$$45. g(x) = \frac{1}{2}x^2 + 3x - 1 \quad 46. g(x) = 2x^2 - x - 9$$

$$47. g(x) = \sqrt{x + 4}$$

$$48. g(x) = \sqrt{2 - x}$$

$$49. g(x) = |3x - 1| + 4 \quad 50. g(x) = 2|1 - x| - 7$$

$$51. g(x) = \frac{4x}{x + 3}$$

$$52. g(x) = \frac{x + 3}{2}$$

Composition of Functions

Exercises 53–56: Use the given $f(x)$ and $g(x)$ to evaluate each expression.

$$53. f(x) = \sqrt{x + 5}, \quad g(x) = x^2 \\ (a) (f \circ g)(2) \quad (b) (g \circ f)(-1)$$

$$54. f(x) = |x^2 - 4|, \quad g(x) = 2x^2 + x + 1 \\ (a) (f \circ g)(1) \quad (b) (g \circ f)(-3)$$

$$55. f(x) = 5x - 2, \quad g(x) = |x| \\ (a) (f \circ g)(-4) \quad (b) (g \circ f)(5)$$

$$56. f(x) = \frac{1}{x - 4}, \quad g(x) = 5 \\ (a) (f \circ g)(3) \quad (b) (g \circ f)(8)$$

Exercises 57–72: Use the given $f(x)$ and $g(x)$ to find each of the following. Identify its domain.

$$(a) (f \circ g)(x) \quad (b) (g \circ f)(x) \quad (c) (f \circ f)(x)$$

$$57. f(x) = x^3, \quad g(x) = x^2 + 3x - 1$$

$$58. f(x) = 2 - x, \quad g(x) = \frac{1}{x^2}$$

$$59. f(x) = x + 2, \quad g(x) = x^4 + x^2 - 3x - 4$$

$$60. f(x) = x^2, \quad g(x) = \sqrt{1 - x}$$

$$61. f(x) = 2 - 3x, \quad g(x) = x^3$$

$$62. f(x) = \sqrt{x}, \quad g(x) = 1 - x^2$$

$$63. f(x) = \frac{1}{x + 1}, \quad g(x) = 5x$$

$$64. f(x) = \frac{1}{3x}, \quad g(x) = \frac{2}{x - 1}$$

$$65. f(x) = x + 4, \quad g(x) = \sqrt{4 - x^2}$$

$$66. f(x) = 2x + 1, \quad g(x) = 4x^3 - 5x^2$$

$$67. f(x) = \sqrt{x - 1}, \quad g(x) = 3x$$

$$68. f(x) = \frac{x - 3}{2}, \quad g(x) = 2x + 3$$

$$69. f(x) = 1 - 5x, \quad g(x) = \frac{1-x}{5}$$

$$70. f(x) = \sqrt[3]{x-1}, \quad g(x) = x^3 + 1$$

$$71. f(x) = \frac{1}{kx}, k > 0, \quad g(x) = \frac{1}{kx}, k > 0$$

$$72. f(x) = ax^2, a > 0, \quad g(x) = \sqrt{ax}, a > 0$$

Exercises 73–76: Use the graph to evaluate each expression.

73.

(a) $(f \circ g)(4)$

(b) $(g \circ f)(3)$

(c) $(f \circ f)(2)$

74.

(a) $(f \circ g)(2)$

(b) $(g \circ g)(0)$

(c) $(g \circ f)(4)$

75.

(a) $(f \circ g)(1)$

(b) $(g \circ f)(-2)$

(c) $(g \circ g)(-2)$

76.

(a) $(f \circ g)(-2)$

(b) $(g \circ f)(1)$

(c) $(f \circ f)(0)$

Exercises 77 and 78: Numerical representations for the functions f and g are given. Evaluate the expression, if possible.

(a) $(g \circ f)(1)$ (b) $(f \circ g)(4)$ (c) $(f \circ f)(3)$

77.

x	1	2	3	4
$f(x)$	4	3	1	2

x	1	2	3	4
$g(x)$	2	3	4	5

78.

x	1	3	4	6
$f(x)$	2	6	5	7

x	2	3	5	7
$g(x)$	4	2	6	0

79. Use the tables for $f(x)$ and $g(x)$ in Exercise 77 to complete the composition shown in the diagram.

80. Use the tables for $f(x)$ and $g(x)$ in Exercise 78 to complete the composition shown in the diagram.

Exercises 81–94: (Refer to Example 11.) Find functions f and g so that $h(x) = (g \circ f)(x)$. Answers may vary.

81. $h(x) = \sqrt{x-2}$

82. $h(x) = (x+2)^4$

83. $h(x) = \frac{1}{x+2}$

84. $h(x) = 5(x+2)^2 - 4$

85. $h(x) = 4(2x+1)^3$

86. $h(x) = \sqrt[3]{x^2+1}$

87. $h(x) = (x^3-1)^2$

88. $h(x) = 4(x-5)^{-2}$

89. $h(x) = -4|x+2| - 3$

90. $h(x) = 5\sqrt{x-1}$

91. $h(x) = \frac{1}{(x-1)^2}$

92. $h(x) = \frac{2}{x^2-x+1}$

93. $h(x) = x^{3/4} - x^{1/4}$

94. $h(x) = x^{2/3} - 5x^{1/3} + 4$

Applications

95. **Profit** (Refer to Example 4.) Determine a profit function P that results if the DVDs are sold for \$15 each. Find the profit from selling 3000 DVDs.

96. **Revenue, Cost, and Profit** Suppose that it costs \$150,000 to produce a master disc for a music video and \$1.50 to produce each copy.
- Write a cost function C that outputs the cost of producing the master disc and x copies.
 - If the music videos are sold for \$6.50 each, find a function R that outputs the revenue received from selling x music videos. What is the revenue from selling 8000 videos?
 - Assuming that the master disc is not sold, find a function P that outputs the profit from selling x music videos. What is the profit from selling 40,000 videos?
 - How many videos must be sold to break even? That is, how many videos must be sold for the revenue to equal the cost?
97. **Converting Units** There are 36 inches in a yard and 2.54 centimeters in an inch.
- Write a function I that converts x yards to inches.
 - Write a function C that converts x inches to centimeters.
 - Express a function F that converts x yards to centimeters as a composition of two functions.
 - Write a formula for F .
98. **Converting Units** There are 4 quarts in 1 gallon, 4 cups in 1 quart, and 16 tablespoons in 1 cup.
- Write a function Q that converts x gallons to quarts.
 - Write a function C that converts x quarts to cups.
 - Write a function T that converts x cups to tablespoons.
 - Express a function F that converts x gallons to tablespoons as a composition of *three* functions.
 - Write a formula for F .
99. **Stopping Distance** (Refer to Example 1.) A car is traveling at 60 miles per hour. The driver has a reaction time of 1.25 seconds.
- Determine a function r that computes the reaction distance for this driver.
 - Find a formula $s(x)$ that computes the stopping distance for this driver traveling at x miles per hour.
 - Evaluate $s(60)$ and interpret the result.
100. **Stopping Distance** (Refer to Example 1.) If a driver with a reaction time of 1.5 seconds attempts to stop while traveling at x miles per hour on dry level pavement, the reaction distance is $r(x) = \frac{11}{5}x$ and the braking distance is $b(x) = \frac{1}{11}x^2$, where both distances are in feet.
- Write a formula for a function s in terms of $r(x)$ and $b(x)$ that gives the stopping distance when driving at x miles per hour. Evaluate $s(55)$.
 - Graph r , b , and s on the same axes. Explain how the graph of s can be found using the graphs of r and b .
 - Make tables for $r(x)$ and $b(x)$ at $x = 11, 22, 33, 44$, and 55. Then use these tables to construct a table for $s(x)$.
101. **Skin Cancer** (Refer to Example 10 and Tables 5.4 and 5.5.) If possible, calculate the composition and interpret the result.
- $(g \circ f)(1)$
 - $(f \circ g)(21)$
102. **Skin Cancer** In Example 10, f and g are both linear.
- Find symbolic representations for f and g .
 - Determine $(g \circ f)(x)$.
 - Evaluate $(g \circ f)(3.5)$ and interpret the result.
103. **Urban Heat Island** Cities are made up of large amounts of concrete and asphalt, which heat up in the daytime from sunlight but do not cool off completely at night. As a result, urban areas tend to be warmer than the surrounding rural areas. This effect is called the *urban heat island*. In the first figure at the top of the next page, f computes the average increase in nighttime summer temperatures in degrees Celsius at Sky Harbor Airport in Phoenix from 1948 to 1990. In this graph 1948 is the base year with a zero temperature increase. The rise in urban temperature increased peak demand for electricity. In the second figure at the top of the next page, g computes the percent increase in electrical demand for an average nighttime temperature increase of x degrees Celsius. (Source: W. Cotton and R. Pielke, *Human Impacts on Weather and Climate*.)

- (a) Evaluate $(g \circ f)(1975)$ graphically.
 (b) Interpret $(g \circ f)(x)$.
104. **Urban Heat Island** (Refer to Exercise 103.) If possible, calculate the composition and interpret the result.
 (a) $(g \circ f)(1980)$ (b) $(f \circ g)(3)$
105. **Urban Heat Island** (Refer to Exercise 103.) The functions f and g are given by $f(x) = 0.11(x - 1948)$ and $g(x) = 1.5x$.
 (a) Evaluate $(g \circ f)(1960)$.
 (b) Find $(g \circ f)(x)$.
 (c) What type of functions are f , g , and $g \circ f$?
106. **Swimming Pools** In the figures, f computes the cubic feet of water in a pool after x days, and g converts cubic feet to gallons.

- (a) Find the gallons of water in the pool after 2 days.
 (b) Interpret $(g \circ f)(x)$.

107. **Temperature** The function f computes the temperature on a summer day after x hours, and g converts Fahrenheit temperature to Celsius temperature. See the figures.

- (a) Evaluate $(g \circ f)(2)$.
 (b) Interpret $(g \circ f)(x)$.

108. **Circular Wave** A marble is dropped into a lake, resulting in a circular wave whose radius increases at a rate of 6 inches per second. Write a formula for C that gives the circumference of the circular wave in inches after t seconds.

109. **Circular Wave** (Refer to Exercise 108.) Write a function A that gives the area contained inside the circular wave in square inches after t seconds.

110. **Geometry** The surface area of a cone (excluding the bottom) is given by $S = \pi r \sqrt{r^2 + h^2}$, where r is its radius and h is its height, as shown in the figure. If the height is twice the radius, write a formula for S in terms of r .

111. **Equilateral Triangle** The area of an equilateral triangle with sides of length s is given by

$$A(s) = \frac{\sqrt{3}}{4}s^2.$$

- (a) Find $A(4s)$ and interpret the result.
 (b) Find $A(s + 2)$ and interpret the result.
112. **Surface Area of a Balloon** The surface area A of a balloon with radius r is given by $A(r) = 4\pi r^2$. Suppose that the radius of the balloon increases from r to $r + h$, where h is a small positive number.
- (a) Find $A(r + h) - A(r)$. Interpret your answer.
 (b) Evaluate your expression in part (a) when $r = 3$ and $h = 0.1$. Then evaluate it for $r = 6$ and $h = 0.1$.
 (c) If the radius of the balloon increases by 0.1, does the surface area always increase by a fixed amount or does the amount depend on the value of r ?
113. **Acid Rain** An air pollutant responsible for acid rain is sulfur dioxide (SO_2). In the table, emissions of SO_2 from burning coal during year x are computed by $C(x)$,

and emissions of SO_2 from burning oil are computed by $O(x)$. Amounts are in millions of tons.

x	1860	1900	1940	1970	2000
$C(x)$	2.4	12.6	24.2	32.4	55.0
$O(x)$	0.0	0.2	2.3	17.6	23.0

Source: B. Freedman.

- (a) Evaluate $(C + O)(1970)$.
 (b) Interpret $(C + O)(x)$.
 (c) Make a table for $(C + O)(x)$.
114. **Acid Rain** (Refer to Exercise 113.) Make a table for a function h defined by $h(x) = (C/O)(x)$. Round values for $h(x)$ to the nearest hundredth. What information does h give regarding the use of coal and oil?
115. **Methane Emissions** Methane is a greenhouse gas that lets sunlight into the atmosphere but blocks heat from escaping the earth's atmosphere. In the table, f models the predicted methane emissions in millions of tons produced by *developed* countries. The function g models the same emissions for *developing* countries.

x	1990	2000	2010	2020	2030
$f(x)$	27	28	29	30	31
$g(x)$	5	7.5	10	12.5	15

Source: A. Nilsson, *Greenhouse Earth*.

- (a) Make a table for a function h that models the total predicted methane emissions for developed and developing countries.
 (b) Write an equation that relates $f(x)$, $g(x)$, and $h(x)$.
116. **Methane Emissions** (Refer to Exercise 115.) The figure shows graphs of the functions f and g that model methane emissions. Use these graphs to sketch a graph of the function h .

117. **Methane Emissions** (Refer to Exercises 115 and 116.) Formulas for f and g are $f(x) = 0.1x - 172$ and $g(x) = 0.25x - 492.5$, where x is the year. Find a symbolic representation for h .
118. **AIDS in the U.S. (1982–1994)** During year x , where $1982 \leq x \leq 1994$, the cumulative number of AIDS cases is modeled by $f(x) = 3200(x - 1982)^2 + 1586$ and the cumulative number of AIDS deaths is modeled by $g(x) = 1900(x - 1982)^2 + 619$. Graph $h(x) = \frac{g(x)}{f(x)}$ in $[1982, 1994, 2]$ by $[0, 1, 0.1]$. Interpret the graph. (Source: Department of Health and Human Services.)
119. **Energy of a Falling Object** A ball with mass m is dropped from an initial height of h_0 and lands with a final velocity of v_f . The kinetic energy of the ball is $K(v) = \frac{1}{2}mv^2$, where v is its velocity, and the potential energy of the ball is $P(h) = mgh$, where h is its height and g is a constant.
- (a) Show that $P(h_0) = K(v_f)$. (Hint: $v_f = \sqrt{2gh_0}$.)
- (b) Interpret your result from part (a).
120. **Sphere** The volume V of a sphere with radius r is given by $V = \frac{4}{3}\pi r^3$, and the surface area S is given by $S = 4\pi r^2$. Show that $V = \frac{4}{3}\pi \left(\frac{S}{4\pi}\right)^{3/2}$.

Applying Concepts

121. Show that the sum of two linear functions is a linear function.
122. Show that if f and g are odd functions, then the composition $g \circ f$ is also an odd function.
123. Let $f(x) = k$ and $g(x) = ax + b$, where k , a , and b are constants.
- (a) Find $(f \circ g)(x)$. What type of function is $f \circ g$?
- (b) Find $(g \circ f)(x)$. What type of function is $g \circ f$?
124. Show that if $f(x) = ax + b$ and $g(x) = cx + d$, then $(g \circ f)(x)$ also represents a linear function. Find the slope of the graph of $(g \circ f)(x)$.

Writing about Mathematics

125. Describe differences between $(fg)(x)$ and $(f \circ g)(x)$. Give examples.
126. Describe differences between $(f \circ g)(x)$ and $(g \circ f)(x)$. Give examples.

5.2 Inverse Functions and Their Representations

- Calculate inverse operations
- Identify one-to-one functions
- Find inverse functions symbolically
- Use other representations to find inverse functions

Introduction

Many actions are reversible. A closed door can be opened—an open door can be closed. One hundred dollars can be withdrawn from and deposited into a savings account. These actions undo or cancel each other. But not all actions are reversible. Explosions and weather are two examples. In mathematics the concept of reversing a calculation and arriving at the original value is associated with an *inverse*.

Actions and their inverses occur in everyday life. Suppose a person opens a car door, gets in, and starts the engine. What are the inverse actions? They are to turn off the engine, get out, and close the car door. Notice that we must reverse the order as well as applying the inverse operation at each step.

Inverse Operations and Inverse Functions

Inverse Operations In mathematics there are basic operations that can be considered inverse operations. For example, if we begin with 10 and add 5, the result is 15. To undo this operation, subtract 5 from 15 to obtain 10. Addition and subtraction are inverse operations. The same is true for multiplication and division. If we multiply a number by 2 and then divide by 2, the original number is obtained. Division and multiplication are inverse operations.

EXAMPLE 1 Finding inverse actions and operations

For each of the following, state the inverse actions or operations.

- (a) Put on a coat and go outside.
 (b) Subtract 7 from x and divide the result by 2.

SOLUTION

- (a) To find the inverse actions, reverse the order and apply the inverse action at each step. The inverse actions would be to come inside and take off the coat.
 (b) We must reverse the order and apply the inverse operation at each step. The inverse operations would be to multiply x by 2 and add 7. The original operations could be expressed as $\frac{x-7}{2}$, and the inverse operations could be written as $2x + 7$.

Now Try Exercises 3 and 7 ◀

Inverse Functions For an introduction to the basic concept of an inverse function, refer to Table 5.7, which can be used to convert gallons to pints. It is apparent that there are 8 pints in a gallon, and $f(x) = 8x$ converts x gallons to an equivalent number of pints. However, if we want to reverse the computation and convert pints to gallons, a different function g is required. This conversion is calculated by $g(x) = \frac{x}{8}$, where x is the number of pints. Function g performs the inverse operation of f . We say that f and g are *inverse functions* and write this as $g(x) = f^{-1}(x)$. See Table 5.8. We read f^{-1} as “ f inverse.”

Table 5.7 Gallons to Pints

x	1	2	3	4
$f(x)$	8	16	24	32

Table 5.8 Pints to Gallons

x	8	16	24	32
$f^{-1}(x)$	1	2	3	4

Multiplication and division are inverse operations. Addition and subtraction are also inverse operations. If $f(x) = x + 5$, then the *inverse function* of f is given by $f^{-1}(x) = x - 5$. For example, $f(5) = 10$, and $f^{-1}(10) = 5$. If input x produces output y with function f , input y produces output x with function f^{-1} . This can be seen numerically in Tables 5.9 and 5.10.

Table 5.9 Add 5

x	0	5	10	15
$f(x)$	5	10	15	20

Table 5.10 Subtract 5

x	5	10	15	20
$f^{-1}(x)$	0	5	10	15

**Figure 5.10** Inverse Functions

From Tables 5.9 and 5.10, note that $f(0) = 5$ and $f^{-1}(5) = 0$. In general, if $f(a) = b$, then $f^{-1}(b) = a$. That is, if f outputs b with input a , then f^{-1} must output a with input b . Inputs and outputs (domains and ranges) are *interchanged for inverse functions*. This statement is illustrated in Figure 5.10.

When $f(x) = x + 5$ and $f^{-1}(x) = x - 5$ are applied in sequence, the output of f is used as input for f^{-1} . This is composition of functions.

$$\begin{aligned}
 (f^{-1} \circ f)(x) &= f^{-1}(f(x)) && \text{Definition of composition} \\
 &= f^{-1}(x + 5) && f(x) = x + 5 \\
 &= (x + 5) - 5 && f^{-1} \text{ subtracts 5 from its input.} \\
 &= x && \text{Identity property}
 \end{aligned}$$

MAKING CONNECTIONS

The Notation f^{-1} and Negative Exponents If a represents a real number, then $a^{-1} = \frac{1}{a}$. For example, $4^{-1} = \frac{1}{4}$. On the other hand, if f represents a function, note that $f^{-1}(x) \neq \frac{1}{f(x)}$. Instead, $f^{-1}(x)$ represents the inverse function of f . For instance, if $f(x) = 5x$, then $f^{-1}(x) = \frac{x}{5} \neq \frac{1}{5x}$.

The composition $f^{-1} \circ f$ with input x produces output x . The same action occurs when computing the composition $f \circ f^{-1}$.

$$\begin{aligned}(f \circ f^{-1})(x) &= f(f^{-1}(x)) && \text{Definition of composition} \\ &= f(x - 5) && f^{-1}(x) = x - 5 \\ &= (x - 5) + 5 && f \text{ adds 5 to its input.} \\ &= x && \text{Simplify.}\end{aligned}$$

Another pair of inverse functions is given by $f(x) = x^3$ and $f^{-1}(x) = \sqrt[3]{x}$. Before a formal definition of inverse functions is given, we must discuss one-to-one functions.

One-to-One Functions

Does every function have an inverse function? The next example answers this question.

EXAMPLE 3 Determining if a function has an inverse function

Table 5.11 represents a function C that computes the percentage of the time that the sky is cloudy in Augusta, Georgia, where x corresponds to the standard numbers for the months. Determine if C has an inverse function.

Table 5.11 Cloudy Skies in Augusta

x (month)	1	2	3	4	5	6	7	8	9	10	11	12
$C(x)$ (%)	43	40	39	29	28	26	27	25	30	26	31	39

Source: J. Williams, *The Weather Almanac*.

SOLUTION For each input, C computes exactly one output. For example, $C(3) = 39$ means that during March the sky is cloudy 39% of the time. If C has an inverse function, the inverse must receive 39 as input and produce exactly one output. Both March and December have cloudy skies 39% of the time. Given an input of 39, it is impossible for an inverse function to output both 3 and 12. Therefore C does not have an inverse function.

Now Try Exercise 19 ◀

If different inputs of a function f produce the same output, then an inverse function of f does not exist. However, if different inputs always produce different outputs, f is a *one-to-one function*. Every one-to-one function has an inverse function. For example, $f(x) = x^2$ is not one-to-one because $f(-2) = 4$ and $f(2) = 4$. Therefore $f(x) = x^2$ does not have an inverse function because an inverse function cannot receive input 4 and produce both -2 and 2 as outputs. However, $g(x) = 5x$ is one-to-one because different inputs always result in different outputs. Therefore g has an inverse function: $g^{-1}(x) = \frac{x}{5}$.

One-to-One Function

A function f is a **one-to-one function** if, for elements c and d in the domain of f ,

$$c \neq d \text{ implies } f(c) \neq f(d).$$

That is, different inputs always result in different outputs.

NOTE A function f is one-to-one if equal outputs always have the same input. This statement can be written as $f(c) = f(d)$ implies $c = d$, which is an equivalent definition.

EXAMPLE 1 Determining if a function is one-to-one graphically

Use each graph to determine if f is one-to-one and if f has an inverse function.

Figure 5.11

Figure 5.12

CLASS DISCUSSION

Use the horizontal line test to explain why a nonconstant linear function has an inverse function, whereas a quadratic function does not.

SOLUTION

- (a) To decide if the graph represents a one-to-one function, determine if different inputs (x -values) always correspond to different outputs (y -values). In Figure 5.11 the horizontal line $y = 2$ intersects the graph of f at $(-1, 2)$, $(1, 2)$, and $(3, 2)$. This means that $f(-1) = f(1) = f(3) = 2$. Three distinct inputs, -1 , 1 , and 3 , produce the same output, 2 . Therefore f is not one-to-one and does not have an inverse function.
- (b) Any horizontal line will intersect the graph of f at most once. For example, the line $y = 3$ intersects the graph of f at one point, $(2, 3)$. See Figure 5.12. Only input 2 results in output 3 . This is true in general. Therefore f is one-to-one and has an inverse function.

Now Try Exercises 13 and 15

NOTE To show that f is not one-to-one, it is not necessary to find the actual points of intersection—we have to show only that a horizontal line can intersect the graph of f more than once.

The technique of visualizing horizontal lines to determine if a graph represents a one-to-one function is called the *horizontal line test*.

Horizontal Line Test

If every horizontal line intersects the graph of a function f at most once, then f is a one-to-one function.

Increasing, Decreasing, and One-to-One Functions If a continuous function f is increasing on its domain, then every horizontal line will intersect the graph of f at most once. By the horizontal line test, f is a one-to-one function. For example, the function f shown in Example 3(b) is always increasing on its domain and so it is one-to-one. Similarly, if a continuous function g is only decreasing on its domain, then g is a one-to-one function.

Symbolic Representations of Inverse Functions

If a function f is one-to-one, then an inverse function f^{-1} exists. Therefore $f(a) = b$ implies $f^{-1}(b) = a$ for every a in the domain of f . That is,

$$(f^{-1} \circ f)(a) = f^{-1}(f(a)) = f^{-1}(b) = a.$$

Similarly, $f^{-1}(b) = a$ implies $f(a) = b$ for every b in the domain of f^{-1} and so

$$(f \circ f^{-1})(b) = f(f^{-1}(b)) = f(a) = b.$$

These two properties can be used to define an inverse function.

Inverse Function

Let f be a one-to-one function. Then f^{-1} is the **inverse function** of f if

$$(f^{-1} \circ f)(x) = f^{-1}(f(x)) = x \quad \text{for every } x \text{ in the domain of } f \text{ and}$$

$$(f \circ f^{-1})(x) = f(f^{-1}(x)) = x \quad \text{for every } x \text{ in the domain of } f^{-1}.$$

In the next two examples, we find an inverse function and verify that it is correct.

EXAMPLE 1 Finding and verifying an inverse function

Let f be the one-to-one function given by $f(x) = x^3 - 2$.

- (a) Find a formula for $f^{-1}(x)$. (b) Identify the domain and range of f^{-1} .
 (c) Verify that your result from part (a) is correct.

SOLUTION

- (a) Since $f(x) = x^3 - 2$, function f cubes the input x and then subtracts 2. To reverse this calculation, the inverse function must add 2 to the input x and then take the cube root. That is, $f^{-1}(x) = \sqrt[3]{x+2}$. An important symbolic technique for finding $f^{-1}(x)$ is to solve the equation $y = f(x)$ for x .

$$\begin{array}{ll} y = x^3 - 2 & y = f(x); \text{ now solve for } x. \\ y + 2 = x^3 & \text{Add 2.} \\ \sqrt[3]{y+2} = x & \text{Take the cube root.} \end{array}$$

- Interchange x and y to obtain $y = \sqrt[3]{x+2}$. This gives us the formula for $f^{-1}(x)$.
 (b) Both the domain and the range of the cube root function include all real numbers. The graph of $f^{-1}(x) = \sqrt[3]{x+2}$ is the graph of the cube root function shifted left 2 units. Therefore the domain and range of f^{-1} also include all real numbers.
 (c) To verify that $f^{-1}(x) = \sqrt[3]{x+2}$ is indeed the inverse of $f(x) = x^3 - 2$, we must show that $f^{-1}(f(x)) = x$ and that $f(f^{-1}(x)) = x$.

$$\begin{array}{ll} f^{-1}(f(x)) = f^{-1}(x^3 - 2) & f(x) = x^3 - 2 \\ = \sqrt[3]{(x^3 - 2) + 2} & f^{-1}(x) = \sqrt[3]{x+2} \\ = \sqrt[3]{x^3} & \text{Combine terms.} \\ = x & \text{Simplify.} \\ f(f^{-1}(x)) = f(\sqrt[3]{x+2}) & f^{-1}(x) = \sqrt[3]{x+2} \\ = (\sqrt[3]{x+2})^3 - 2 & \text{Cube the expression.} \\ = (x+2) - 2 & \text{Combine terms.} \\ = x & \end{array}$$

Algebra Review

To review rational exponents and radical notation, see Chapter R (page R-41).

These calculations verify that our result is correct.

Now Try Exercise 73 ◀

The symbolic technique used in Example 4(a) is now summarized verbally.

Finding a Symbolic Representation for f^{-1}

To find a formula for f^{-1} , perform the following steps.

STEP 1: Verify that f is a one-to-one function.

STEP 2: Solve the equation $y = f(x)$ for x , obtaining the equation $x = f^{-1}(y)$.

STEP 3: Interchange x and y to obtain $y = f^{-1}(x)$.

To verify $f^{-1}(x)$, show that $(f^{-1} \circ f)(x) = x$ and $(f \circ f^{-1})(x) = x$.

NOTE One reason for interchanging the variables in Step 3 is to make it easier to graph $y = f^{-1}(x)$ in the xy -plane.

EXAMPLE 5 Finding and verifying an inverse function

Suppose that a person x inches tall sprains an ankle. An approximation for the length of the crutch (in inches) that this person might need is calculated by $f(x) = \frac{18}{25}x + 2$.

- Explain why f is a one-to-one function.
- Find a formula for $f^{-1}(x)$.
- Verify that this is the inverse function of f .
- Interpret the meaning of $f^{-1}(56)$.

SOLUTION

- Since f is a linear function, its graph is a line with a nonzero slope of $\frac{18}{25}$. Every horizontal line intersects it at most once. By the horizontal line test, f is one-to-one.
- To find $f^{-1}(x)$, solve the equation $y = f(x)$ for x .

$$y = \frac{18}{25}x + 2 \quad y = f(x)$$

$$y - 2 = \frac{18}{25}x \quad \text{Subtract 2}$$

$$\frac{25}{18}(y - 2) = x \quad \text{Multiply by } \frac{25}{18}, \text{ the reciprocal of } \frac{18}{25}.$$

Now interchange x and y to obtain $y = \frac{25}{18}(x - 2)$. The formula for the inverse is, therefore,

$$f^{-1}(x) = \frac{25}{18}(x - 2).$$

- We must show that $(f^{-1} \circ f)(x) = x$ and $(f \circ f^{-1})(x) = x$.

$$(f^{-1} \circ f)(x) = f^{-1}(f(x)) \quad \text{Definition of composition}$$

$$= f^{-1}\left(\frac{18}{25}x + 2\right) \quad f(x) = \frac{18}{25}x + 2$$

$$= \frac{25}{18}\left(\left(\frac{18}{25}x + 2\right) - 2\right) \quad f^{-1}(x) = \frac{25}{18}(x - 2)$$

$$= \frac{25}{18}\left(\frac{18}{25}x\right) \quad \text{Simplify.}$$

$$= x \quad \text{It checks.}$$

Similarly,

$$\begin{aligned}
 (f \circ f^{-1})(x) &= f(f^{-1}(x)) && \text{Definition of composition} \\
 &= f\left(\frac{25}{18}(x - 2)\right) && f^{-1}(x) = \frac{25}{18}(x - 2) \\
 &= \frac{18}{25}\left(\frac{25}{18}(x - 2)\right) + 2 && f(x) = \frac{18}{25}x + 2 \\
 &= (x - 2) + 2 && \text{Simplify.} \\
 &= x && \text{It checks.}
 \end{aligned}$$

Figure 5.13

- (d) The expression $f(x)$ calculates the proper crutch length for a person x inches tall, and $f^{-1}(x)$ computes the height of a person requiring a crutch x inches long. Therefore $f^{-1}(56) = \frac{25}{18}(56 - 2) = 75$ means that a 56-inch crutch would be appropriate for a person 75 inches tall. See Figure 5.13.

Now Try Exercise 123 ◀

EXAMPLE 5 Restricting the domain of a function

Let $f(x) = (x - 1)^2$.

- Does f have an inverse function? Explain.
- Restrict the domain of f so that f^{-1} exists.
- Find $f^{-1}(x)$ for the restricted domain.

SOLUTION

- (a) The graph of $f(x) = (x - 1)^2$, shown in Figure 5.14, does not pass the horizontal line test. Therefore f is not one-to-one and does not have an inverse function.

Figure 5.14 Not One-to-One

Figure 5.15 Restricting the Domain

- If we restrict the domain of f to $D = \{x | x \geq 1\}$, then f becomes a one-to-one function. To illustrate this, the graph of $y = (x - 1)^2$ for $x \geq 1$ is shown in Figure 5.15. This graph passes the horizontal line test and f^{-1} exists on the restricted domain.
- Assume that $x \geq 1$ and solve the equation $y = f(x)$ for x .

$$\begin{aligned}
 y &= (x - 1)^2 && \text{Equation } y = f(x) \\
 \sqrt{y} &= x - 1 && \text{Take the positive square root.} \\
 \sqrt{y} + 1 &= x && \text{Note: } x \geq 1 \text{ implies that } x - 1 \geq 0. \\
 &&& \text{Add 1.}
 \end{aligned}$$

Thus $f^{-1}(x) = \sqrt{x} + 1$.

Now Try Exercise 63 ◀

Figure 5.16

Table 5.12

x	1940	1970	2000
$f(x)$	5	11	27

Table 5.13

x	5	11	27
$f^{-1}(x)$	1940	1970	2000

NOTE The graph of $f(x) = x^5 + 3x^3 - x^2 + 5x - 3$ is shown in Figure 5.16. By the horizontal line test, f is one-to-one and f^{-1} exists. However, it would be difficult to obtain a formula for f because we would need to solve $y = x^5 + 3x^3 - x^2 + 5x - 3$ for x . It is important to realize that many functions have inverses that are either difficult or impossible to find symbolically.

Other Representations of Inverse Functions

Given a symbolic representation of a one-to-one function f , we can often find its inverse f^{-1} by using the techniques discussed in the previous subsection. Numerical and graphical representations of a one-to-one function can also be used to find its inverse.

Numerical Representations In Table 5.12, f has domain $D = \{1940, 1970, 2000\}$ and it computes the percentage of the U.S. population with 4 or more years of college in year x .

Function f is one-to-one because different inputs always produce different outputs. Therefore f^{-1} exists. Since $f(1940) = 5$, it follows that $f^{-1}(5) = 1940$. Similarly, $f^{-1}(11) = 1970$ and $f^{-1}(27) = 2000$. Table 5.13 shows a numerical representation of f^{-1} .

The domain of f is $\{1940, 1970, 2000\}$ and the range of f is $\{5, 11, 27\}$. The domain of f^{-1} is $\{5, 11, 27\}$ and the range of f^{-1} is $\{1940, 1970, 2000\}$. The functions f and f^{-1} interchange domains and ranges. This result is true in general for inverse functions.

The diagrams in Figures 5.17 and 5.18 demonstrate this property. To obtain f^{-1} from f , we simply reverse the arrows for f . This reversal causes the domains and ranges to be interchanged.

Figure 5.17

Figure 5.18

Figure 5.19 shows a function f that is not one-to-one. In Figure 5.20 the arrows defining f have been reversed. This is a relation. However, this relation does not represent the inverse function because input 4 produces two outputs, 1 and 2.

Figure 5.19 Function

Figure 5.20 Not a Function

The relationship between domains and ranges is summarized in the following box.

Domains and Ranges of Inverse Functions

The domain of f equals the range of f^{-1} .

The range of f equals the domain of f^{-1} .

Graphical Representations If the point $(2, 5)$ lies on the graph of f , then $f(2) = 5$ and $f^{-1}(5) = 2$. Therefore the point $(5, 2)$ must lie on the graph of f^{-1} . In general, if the point (a, b) lies on the graph of f , then the point (b, a) lies on the graph of f^{-1} . Refer to Figure 5.21. If a line segment is drawn between the points (a, b) and (b, a) , the line $y = x$ is a perpendicular bisector of this line segment. Figure 5.22 shows pairs of points in the form (a, b) and (b, a) . Figure 5.23 shows continuous graphs of f and f^{-1} passing through these points. The graph of f^{-1} is a *reflection* of the graph of f across the line $y = x$.

Figure 5.21

Figure 5.22

Figure 5.23

Graphs of Functions and Their Inverses

The graph of f^{-1} is a reflection of the graph of f across the line $y = x$.

EXAMPLE 3 Representing an inverse function graphically

Let $f(x) = x^3 + 2$. Graph f . Then sketch a graph of f^{-1} .

SOLUTION Figure 5.24 shows a graph of f . To sketch a graph of f^{-1} , reflect the graph of f across the line $y = x$. The graph of f^{-1} appears as though it were the “reflection” of the graph of f in a mirror located along $y = x$. See Figure 5.25.

Figure 5.25

Now Try Exercise 113

Figure 5.26

EXAMPLE 5 Evaluating f and f^{-1} graphically

Use the graph of f in Figure 5.26 to evaluate each expression.

- (a) $f(2)$ (b) $f^{-1}(3)$ (c) $f^{-1}(-3)$

SOLUTION

Getting Started To evaluate $f(a)$ graphically, find a on the x -axis. Move upward or downward to the graph of f and determine the corresponding y -value. To evaluate $f^{-1}(b)$ graphically, find b on the y -axis. Move left or right to the graph of f and determine the corresponding x -value. ▶

- (a) To evaluate $f(2)$, find 2 on the x -axis, move upward to the graph of f , and then move across to the y -axis to obtain $f(2) = 3$, as shown in Figure 5.27.
- (b) Start by finding 3 on the y -axis, move right to the graph of f , and then move downward to the x -axis to obtain $f^{-1}(3) = 2$, as shown in Figure 5.28. Notice that $f(2) = 3$ from part (a) and $f^{-1}(3) = 2$ here.
- (c) Find -3 on the y -axis, move left to the graph of f , and then move upward to the x -axis. We can see from Figure 5.29 that $f^{-1}(-3) = -1$.

Figure 5.27 $f(2) = 3$ Figure 5.28 $f^{-1}(3) = 2$ Figure 5.29 $f^{-1}(-3) = -1$ **CLASS DISCUSSION**

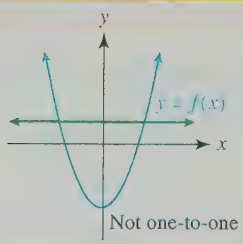

Does an inverse function for $f(x) = |2x - 1|$ exist? Explain. What difficulties would you encounter if you tried to evaluate $f^{-1}(3)$ graphically?

Now Try Exercise 101 ◀

5.2 Putting It All Together

The following table summarizes some important concepts about inverse functions.

Concept	Comments	Examples
One-to-one function	f is one-to-one if different inputs always result in different outputs. That is, $a \neq b$ implies $f(a) \neq f(b)$.	$f(x) = x^2 - 4x$ is not one-to-one because $f(0) = 0$ and $f(4) = 0$. With this function, different inputs can result in the same output.

Concept	Comments	Examples
Horizontal line test	If every horizontal line intersects the graph of f at most once, then f is one-to-one.	 <p>Not one-to-one</p>
Inverse function	<p>If a function f is one-to-one, it has an inverse function f^{-1} that satisfies both</p> $(f^{-1} \circ f)(x) = f^{-1}(f(x)) = x$ <p>and</p> $(f \circ f^{-1})(x) = f(f^{-1}(x)) = x.$	<p>$f(x) = 3x - 1$ is one-to-one and has inverse function $f^{-1}(x) = \frac{x+1}{3}$.</p> $f^{-1}(f(x)) = f^{-1}(3x - 1) = \frac{(3x - 1) + 1}{3} = x$ <p>Similarly,</p> $f(f^{-1}(x)) = x.$
Domains and ranges of inverse functions	<p>The domain of f equals the range of f^{-1}.</p> <p>The range of f equals the domain of f^{-1}.</p>	<p>Let $f(x) = (x + 2)^2$ with restricted domain $x \geq -2$ and range $y \geq 0$. It follows that $f^{-1}(x) = \sqrt{x} - 2$ with domain $x \geq 0$ and range $y \geq -2$.</p>

Both functions and their inverses have verbal, symbolic, numerical, and graphical representations. The following table summarizes these representations.

Concept	Examples																
Verbal representations	<p>Given a verbal representation of f, apply the inverse operations in reverse order to find f^{-1}.</p> <p><i>Example:</i> The function f multiplies 2 times x and then adds 25. The function f^{-1} subtracts 25 from x and divides the result by 2.</p>																
Symbolic representations	<p>If possible, solve the equation $y = f(x)$ for x. For example, let $f(x) = 3x - 5$.</p> <p>$y = 3x - 5$ is equivalent to $\frac{y + 5}{3} = x$.</p> <p>Interchange x and y to obtain $f^{-1}(x) = \frac{x + 5}{3}$.</p>																
Numerical representations	<table><tr><td>x</td><td>1</td><td>2</td><td>3</td></tr><tr><td>$f(x)$</td><td>0</td><td>5</td><td>7</td></tr></table> <table><tr><td>x</td><td>0</td><td>5</td><td>7</td></tr><tr><td>$f^{-1}(x)$</td><td>1</td><td>2</td><td>3</td></tr></table> <p>(Interchange inputs and outputs.)</p>	x	1	2	3	$f(x)$	0	5	7	x	0	5	7	$f^{-1}(x)$	1	2	3

Exercises

Inverse Operations

Exercises 1–4: State the inverse action or actions.

1. Opening a window 2. Climbing up a ladder
3. Walking into a classroom, sitting down, and opening a book
4. Opening the door and turning on the lights

Exercises 5–12: Describe verbally the inverse of the statement. Then express both the given statement and its inverse symbolically.

5. Add 2 to x .
6. Multiply x by 5.
7. Subtract 2 from x and multiply the result by 3.
8. Divide x by 20 and then add 10.
9. Take the cube root of x and add 1.
10. Multiply x by -2 and add 3.
11. Take the reciprocal of a nonzero number x .
12. Take the square root of a positive number x .

One-to-One Functions

Exercises 13–18: Use the graph of $y = f(x)$ to determine if f is one-to-one.

13.

14.

15.

16.

Exercises 19–22: The table is a complete representation of f . Use the table to determine if f is one-to-one and has an inverse.

19.

x	1	2	3	4
$f(x)$	4	3	3	5

20.

x	-2	0	2	4
$f(x)$	4	2	0	-2

21.

x	0	2	4	6	8
$f(x)$	-1	0	4	1	-3

22.

x	-2	-1	0	1	2
$f(x)$	4	1	0	1	4

Exercises 23–36: Determine if f is one-to-one. You may want to graph $y = f(x)$ and apply the horizontal line test.

23. $f(x) = 2x - 7$ 24. $f(x) = x^2 - 1$
 25. $f(x) = -2x^2 + x$ 26. $f(x) = 4 - \frac{3}{4}x$
 27. $f(x) = x^4$ 28. $f(x) = |2x - 5|$
 29. $f(x) = |x - 1|$ 30. $f(x) = x^3$
 31. $f(x) = \frac{1}{1 + x^2}$ 32. $f(x) = \frac{1}{x}$
 33. $f(x) = 3x - x^3$ 34. $f(x) = x^{2/3}$
 35. $f(x) = x^{1/2}$ 36. $f(x) = x^3 - 4x$

Exercises 37–40: **Modeling** Decide if the situation could be modeled by a one-to-one function.

37. The distance between the ground and a person who is riding a Ferris wheel after x seconds
 38. The cumulative numbers of AIDS cases from 1980 to present

39. The population of the United States from 1980 to 2000
 40. The height y of a stone thrown upward after x seconds

Symbolic Representations of Inverse Functions

Exercises 41–62: Find a symbolic representation for $f^{-1}(x)$.

41. $f(x) = \sqrt[3]{x}$ 42. $f(x) = 2x$
 43. $f(x) = -2x + 10$ 44. $f(x) = x^3 + 2$
 45. $f(x) = 3x - 1$ 46. $f(x) = \frac{x - 1}{2}$
 47. $f(x) = 2x^3 - 5$ 48. $f(x) = 1 - \frac{1}{2}x^3$
 49. $f(x) = x^2 - 1, x \geq 0$
 50. $f(x) = (x + 2)^2, x \leq -2$
 51. $f(x) = \frac{1}{2x}$ 52. $f(x) = \frac{2}{\sqrt{x}}$
 53. $f(x) = \frac{1}{2}(4 - 5x) + 1$ 54. $f(x) = 6 - \frac{3}{4}(2x - 4)$
 55. $f(x) = \frac{x}{x + 2}$ 56. $f(x) = \frac{3x}{x - 1}$
 57. $f(x) = \frac{2x + 1}{x - 1}$ 58. $f(x) = \frac{1 - x}{3x + 1}$
 59. $f(x) = \frac{1}{x} - 3$ 60. $f(x) = \frac{1}{x + 5} + 2$
 61. $f(x) = \frac{1}{x^3 - 1}$ 62. $f(x) = \frac{2}{2 - x^3}$

Exercises 63–70: Restrict the domain of $f(x)$ so that f is one-to-one. Then find $f^{-1}(x)$. Answers may vary.

63. $f(x) = 4 - x^2$ 64. $f(x) = 2(x + 3)^2$
 65. $f(x) = (x - 2)^2 + 4$ 66. $f(x) = x^4 - 1$
 67. $f(x) = x^{2/3} + 1$ 68. $f(x) = 2(x + 3)^{2/3}$
 69. $f(x) = \sqrt{9 - 2x^2}$ 70. $f(x) = \sqrt{25 - x^2}$

Exercises 71–84: Find a formula for $f^{-1}(x)$. Identify the domain and range of f^{-1} . Verify that f and f^{-1} are inverses.

71. $f(x) = 5x - 15$
 72. $f(x) = (x + 3)^2, x \geq -3$

73. $f(x) = \sqrt[3]{x-5}$ 74. $f(x) = 6 - 7x$

75. $f(x) = \frac{x-5}{4}$ 76. $f(x) = \frac{x+2}{9}$

77. $f(x) = \sqrt{x-5}, x \geq 5$

78. $f(x) = \sqrt{5-2x}, x \leq \frac{5}{2}$

79. $f(x) = \frac{1}{x+3}$ 80. $f(x) = \frac{2}{x-1}$

81. $f(x) = 2x^3$ 82. $f(x) = 1 - 4x^3$

83. $f(x) = x^2, x \geq 0$ 84. $f(x) = \sqrt[3]{1-x}$

Numerical Representations of Inverse Functions

Exercises 85–88: Use the table for $f(x)$ to find a table for $f^{-1}(x)$. Identify the domains and ranges of f and f^{-1} .

Applications

121. **Volume** The volume V of a sphere with radius r is given by $V = \frac{4}{3}\pi r^3$.

(a) Does V represent a one-to-one function?

(b) What does the inverse of V compute?

(c) Find a formula for the inverse.

(d) Normally we interchange x and y to find the inverse function. Does it make sense to interchange V and r in part (c) of this exercise? Explain.

122. **Temperature** The formula $F = \frac{9}{5}C + 32$ converts a Celsius temperature to Fahrenheit temperature.

(a) Find a formula for the inverse.

(b) Normally we interchange x and y to find the inverse function. Does it make sense to interchange F and C in part (a) of this exercise? Explain.

(c) What Celsius temperature is equivalent to 68°F ?

123. **Height and Weight** The formula $W = \frac{25}{7}h - \frac{800}{7}$ approximates the recommended minimum weight for a person h inches tall, where $62 \leq h \leq 76$.

(a) What is the recommended minimum weight for someone 70 inches tall?

(b) Does W represent a one-to-one function?

(c) Find a formula for the inverse.

(d) Evaluate the inverse for 150 pounds and interpret the result.

(e) What does the inverse compute?

124. **Planetary Orbits** The formula $T(x) = x^{3/2}$ calculates the time in years that it takes a planet to orbit the sun if the planet is x times farther from the sun than Earth is.

(a) Find the inverse of T .

(b) What does the inverse of T calculate?

125. **Converting Units** The tables represent a function F that converts yards to feet and a function Y that converts miles to yards. Evaluate each expression and interpret the results.

x (yd)	1760	3520	5280	7040	8800
$F(x)$ (ft)	5280	10,560	15,840	21,120	26,400

x (mi)	1	2	3	4	5
$Y(x)$ (yd)	1760	3520	5280	7040	8800

(a) $(F \circ Y)(2)$

(b) $F^{-1}(26,400)$

(c) $(Y^{-1} \circ F^{-1})(21,120)$

126. **Converting Units** (Refer to Exercise 125.)

(a) Find formulas for $F(x)$, $Y(x)$, and $(F \circ Y)(x)$.

(b) Find a formula for $(Y^{-1} \circ F^{-1})(x)$. What does this function compute?

127. **Converting Units** The tables represent a function C that converts tablespoons to cups and a function Q that converts cups to quarts. Evaluate each expression and interpret the results.

x (tbsp)	32	64	96	128
$C(x)$ (c)	2	4	6	8

x (c)	2	4	6	8
$Q(x)$ (qt)	0.5	1	1.5	2

(a) $(Q \circ C)(96)$

(b) $Q^{-1}(2)$

(c) $(C^{-1} \circ Q^{-1})(1.5)$

128. **Converting Units** (Refer to Exercise 127.)

(a) Find formulas for $C(x)$, $Q(x)$, and $(Q \circ C)(x)$.

(b) Find a formula for $(C^{-1} \circ Q^{-1})(x)$. What does this function compute?

129. **Air Pollution** Tiny particles suspended in the air are necessary for clouds to form. Experts believe that air pollutants may cause an increase in cloud cover. From 1930 to 1980 the percentage of cloud cover over the world's oceans was monitored. The formula $f(x) = 0.06(x - 1930) + 62.5$ for $1930 \leq x \leq 1980$, approximates this percentage. (Source: W. Cotton and R. Pielke, *Human Impacts on Weather and Climate*.)

(a) Evaluate the expressions $f(1930)$ and $f(1980)$. How did the amount of cloud cover over the oceans change during this 50-year period?

(b) What does $f^{-1}(x)$ compute?

(c) Use part (a) to evaluate $f^{-1}(62.5)$ and $f^{-1}(65.5)$.

(d) Find $f^{-1}(x)$.

130. **Rise in Sea Level** Because of the greenhouse effect, the global sea level could rise due to partial melting of the polar ice caps. The table represents a function R that models this expected rise in sea level in centimeters for the year t . (This model assumes no changes in current trends.)

t (yr)	1990	2000	2030	2070	2100
$R(t)$ (cm)	0	1	18	44	66

Source: A. Nilsson, *Greenhouse Earth*.

- (a) Is R a one-to-one function? Explain.
- (b) Use $R(t)$ to find a table for $R^{-1}(t)$. Interpret R^{-1} .

Writing about Mathematics

131. Explain how to find verbal, numerical, graphical, and symbolic representations of an inverse function. Give examples.

132. Can a one-to-one function have more than one x -intercept or more than one y -intercept? Explain.
133. If the graphs of $y = f(x)$ and $y = f^{-1}(x)$ intersect at a point (a, b) , what can be said about this point? Explain.
134. If $f(x) = ax^2 + bx + c$ with $a \neq 0$, does $f^{-1}(x)$ exist? Explain.

EXTENDED AND DISCOVERY EXERCISES

1. **Interpreting an Inverse** Let $f(x)$ compute the height in feet of a rocket after x seconds of upward flight.
- (a) Explain what $f^{-1}(x)$ computes.
- (b) Interpret the solution to the equation $f(x) = 5000$.
- (c) Explain how to solve the equation in part (b) using $f^{-1}(x)$.
2. If the graph of f lies entirely in quadrants I and II, in which quadrant(s) does the graph of f^{-1} lie?

CHECKING BASIC CONCEPTS FOR SECTIONS 5.1 AND 5.2

1. Use the table to evaluate each expression, if possible.

x	-2	-1	0	1	2
$f(x)$	0	1	-2	-1	2
$g(x)$	1	-2	-1	2	0

- (a) $(f + g)(1)$ (b) $(f - g)(-1)$
- (c) $(fg)(0)$ (d) $(f/g)(2)$
- (e) $(f \circ g)(2)$ (f) $(g \circ f)(-2)$
2. Use the graph to evaluate each expression, if possible.

(a) $(f + g)(1)$ (b) $(g - f)(0)$

(c) $(fg)(2)$ (d) $(g/f)(-1)$

(e) $(f \circ g)(2)$ (f) $(g \circ f)(1)$

3. Let $f(x) = x^2 + 3x - 2$ and $g(x) = 3x - 1$. Find each expression.
- (a) $(f + g)(x)$ (b) $(f/g)(x)$ (c) $(f \circ g)(x)$
4. If $f(x) = 5 - 2x$, find $f^{-1}(x)$.
5. Use the graph in Exercise 2 to answer the following.
- (a) Is f one-to-one? Does f^{-1} exist? If so, find it.
- (b) Is g one-to-one? Does g^{-1} exist? If so, find it.
6. Graph $f(x) = \sqrt[3]{x}$ and $y = x$. Then graph $y = f^{-1}(x)$.
7. Use the table in Exercise 1 to evaluate the following. (Assume that f^{-1} exists.)
- (a) $f^{-1}(-2)$ (b) $(f^{-1} \circ g)(1)$
8. Use the graph in Exercise 2 to evaluate the following.
- (a) $f^{-1}(2)$ (b) $(f^{-1} \circ g)(0)$

5.3 Exponential Functions and Models

- Distinguish between linear and exponential growth
- Recognize exponential growth and decay
- Calculate compound interest
- Use the natural exponential function in applications
- Model data with exponential functions

Introduction

Though modern exponential notation was not developed until 1637 by the great French mathematician René Descartes, some of the earliest applications involving exponential functions occurred in the calculation of interest. The custom of charging interest dates back to at least 2000 B.C. in ancient Babylon, where interest rates ran as high as 33%. Today, exponential functions are used not only to calculate interest, but also to model a wide variety of phenomena in business, biology, medicine, engineering, and education. This section discusses exponential functions and their representations. (Source: *Historical Topics for the Mathematics Classroom, Thirty-first Yearbook, NCTM.*)

Linear and Exponential Growth

A linear function g can be written as $g(x) = mx + b$, where m represents the rate of change in $g(x)$ for each unit increase in x . For example, Table 5.14 shows a numerical representation of a linear function g . Each time x increases by 1 unit, $g(x)$ increases by 2 units. We can write a formula $g(x) = 2x + 3$ because the rate of change is 2 and $g(0) = 3$.

Table 5.14 A Linear Function

x	0	1	2	3	4	5
$y = g(x)$	3	5	7	9	11	13

An exponential function is fundamentally different from a linear function. Rather than *adding* a fixed amount to the previous y -value for each unit increase in x , an exponential function *multiplies* the previous y -value by a fixed amount for each unit increase in x . Table 5.15 shows an exponential function f . Note that in Table 5.15 consecutive y -values are found by multiplying the previous y -value by 2.

Table 5.15 An Exponential Function

x	0	1	2	3	4	5
$y = f(x)$	3	6	12	24	48	96

Compare the following patterns for calculating $g(x)$ and $f(x)$.

Linear Growth

$$\begin{aligned}
 g(0) &= 3 \\
 g(1) &= \underbrace{3}_{g(0)} + 2 = 3 + 2 \cdot 1 = 5 \\
 g(2) &= \underbrace{3 + 2}_{g(1)} + 2 = 3 + 2 \cdot 2 = 7 \\
 g(3) &= \underbrace{3 + 2 + 2}_{g(2)} + 2 = 3 + 2 \cdot 3 = 9 \\
 g(4) &= \underbrace{3 + 2 + 2 + 2}_{g(3)} + 2 = 3 + 2 \cdot 4 = 11 \\
 g(5) &= \underbrace{3 + 2 + 2 + 2 + 2}_{g(4)} + 2 = 3 + 2 \cdot 5 = 13
 \end{aligned}$$

Exponential Growth

$$\begin{aligned}
 f(0) &= 3 \\
 f(1) &= \underbrace{3}_{f(0)} \cdot 2 = 3 \cdot 2^1 = 6 \\
 f(2) &= \underbrace{3 \cdot 2}_{f(1)} \cdot 2 = 3 \cdot 2^2 = 12 \\
 f(3) &= \underbrace{3 \cdot 2 \cdot 2}_{f(2)} \cdot 2 = 3 \cdot 2^3 = 24 \\
 f(4) &= \underbrace{3 \cdot 2 \cdot 2 \cdot 2}_{f(3)} \cdot 2 = 3 \cdot 2^4 = 48 \\
 f(5) &= \underbrace{3 \cdot 2 \cdot 2 \cdot 2 \cdot 2}_{f(4)} \cdot 2 = 3 \cdot 2^5 = 96
 \end{aligned}$$

Notice that if x is a positive integer then

$$g(x) = 3 + \underbrace{(2 + 2 + \cdots + 2)}_{x \text{ terms}} \quad \text{and} \quad f(x) = 3 \cdot \underbrace{(2 \cdot 2 \cdots 2)}_{x \text{ factors}}.$$

Using these patterns, we can write formulas for $g(x)$ and $f(x)$ as follows.

$$g(x) = 3 + 2x \quad \text{and} \quad f(x) = 3 \cdot 2^x$$

This discussion gives motivation for the following definition.

Exponential Function

A function f represented by

$$f(x) = Ca^x, \quad a > 0, \quad a \neq 1, \quad \text{and} \quad C > 0,$$

is an **exponential function** with base a and coefficient C .

NOTE Some definitions for an exponential function require that $C = 1$. In this case, an exponential function is defined as $f(x) = a^x$.

Examples of exponential functions include

$$f(x) = 3^x, \quad g(x) = 5(1.7)^x, \quad \text{and} \quad h(x) = 4\left(\frac{1}{2}\right)^x.$$

Their bases are 3 , 1.7 , and $\frac{1}{2}$, respectively. When evaluating exponential functions, remember that any *nonzero* number raised to the 0 power equals 1. Thus $f(0) = 3^0 = 1$, $g(0) = 5(1.7)^0 = 5$, and $h(0) = 4\left(\frac{1}{2}\right)^0 = 4$.

NOTE If $f(x) = Ca^x$, then $f(0) = Ca^0 = C(1) = C$. That is, C equals the value of the function at $x = 0$. If x represents time, then C often equals the *initial value* of the quantity being modeled by f .

For large values of x , an exponential function with $a > 1$ grows faster than any linear function. Figures 5.30 and 5.31 show graphs of $f(x) = 2^x$ and $g(x) = 2x$, respectively. The points shown in the corresponding tables have also been plotted. Notice that the graph of the exponential function f increases more rapidly than the graph of the linear function g for large values of x .

x	-1	0	1	2	3	4
2^x	$\frac{1}{2}$	1	2	4	8	16

Figure 5.30 Exponential Function

x	-1	0	1	2	3	4
$2x$	-2	0	2	4	6	8

Figure 5.31 Linear Function

EXAMPLE 1 Recognizing linear and exponential data

For each table, find either a linear or an exponential function that models the data.

(a)

x	0	1	2	3
y	-3	-1.5	0	1.5

(b)

x	0	1	2	3	4
y	16	4	1	$\frac{1}{4}$	$\frac{1}{16}$

(c)

x	0	1	2	3
y	3	4.5	6.75	10.125

(d)

x	0	1	2	3	4
y	16	12	8	4	0

SOLUTION

- (a) For each unit increase in x , the y -values increase by 1.5, so the data are linear. Because $y = -3$ when $x = 0$, it follows that the data can be modeled by $f(x) = 1.5x - 3$.
- (b) For each unit increase in x , the y -values are multiplied by $\frac{1}{4}$. This is an exponential function given by $f(x) = Ca^x$ with $C = f(0) = 16$ and $a = \frac{1}{4}$, so $f(x) = 16\left(\frac{1}{4}\right)^x$.
- (c) Since the data do not change by a fixed amount for each unit increase in x , the data are not linear. To determine if the data are exponential, calculate ratios of consecutive y -values.

$$\frac{4.5}{3} = 1.5, \quad \frac{6.75}{4.5} = 1.5, \quad \frac{10.125}{6.75} = 1.5$$

For each unit increase in x , the next y -value in the table can be found by multiplying the previous y -value by 1.5, so let $a = 1.5$. Since $y = 3$ when $x = 0$, let $C = 3$. Thus $f(x) = 3(1.5)^x$.

- (d) For each unit increase in x , the next y -value is found by adding -4 to the previous y -value, so $f(x) = -4x + 16$.

Now Try Exercises 15 and 17

Determining an Exponential Function Two points can be used to determine a line. In a similar way, two points can be used to determine C and a in the formula $f(x) = Ca^x$. This technique is demonstrated in the next example.

EXAMPLE 2 Finding exponential functions

Find values for C and a so that $f(x) = Ca^x$ satisfies the conditions.

- (a) $f(0) = 4$ and $f(1) = 6$ (b) $f(-1) = 8$ and $f(2) = 1$

SOLUTION

- (a) $f(0) = 4$, so $C = 4$. Because $\frac{f(1)}{f(0)} = \frac{6}{4} = 1.5$, it follows that for each unit increase in x , the output is multiplied by 1.5. Thus $a = 1.5$ and $f(x) = 4(1.5)^x$.

- (b) Note that $\frac{f(2)}{f(-1)} = \frac{Ca^2}{Ca^{-1}} = a^3$, and so $a^3 = \frac{1}{8}$, or $a = \sqrt[3]{\frac{1}{8}} = \frac{1}{2}$. Thus $f(x) = C\left(\frac{1}{2}\right)^x$.

We can determine C as follows. Because $f(2) = 1$ and $f(2) = C\left(\frac{1}{2}\right)^2 = \frac{1}{4}C$, it follows that $\frac{1}{4}C = 1$, or $C = 4$. Thus $f(x) = 4\left(\frac{1}{2}\right)^x$.

Now Try Exercises 29 and 31

Figure 5.32 Exponential Growth

Exponential Growth and Decay

If an exponential function is written as $f(x) = Ca^x$ with $a > 1$, then $f(x)$ experiences **exponential growth**, as illustrated in Figure 5.32. If $a > 1$, then the y -values increase by a factor of a for each unit increase in x . We say that the **growth factor** is a . For example, if $f(x) = 5(4)^x$, then the growth factor is 4. If $0 < a < 1$, then the y -values decrease by a

Figure 5.33 Exponential Decay

factor of a for each unit increase in x . In this case, $f(x) = Ca^x$ experiences **exponential decay** with **decay factor** a . See Figure 5.33. Exponential decay was modeled in Example 1(b), where the decay factor was $a = \frac{1}{4}$.

Properties of Exponential Functions

An exponential function f , defined by $f(x) = Ca^x$ with $a > 0$, $a \neq 1$, and $C > 0$, has the following properties.

1. The domain of f is $(-\infty, \infty)$ and the range of f is $(0, \infty)$.
2. The graph of f is continuous with no breaks. The x -axis is a horizontal asymptote. There are no x -intercepts and the y -intercept is C .
3. If $a > 1$, f is increasing on its domain; if $0 < a < 1$, f is decreasing on its domain.
4. f is one-to-one and therefore has an inverse. (See Section 5.4.)

Graphs of Exponential Functions To investigate further the effect that a has on the graph of an exponential function, we can let $C = 1$ in $f(x) = Ca^x$ and graph $y = 1^x$, $y = 1.3^x$, $y = 1.7^x$, and $y = 2.5^x$, as shown in Figure 5.34. (Note that $f(x) = 1^x$ does not represent an exponential function. However, the graph of $y = 1^x$ represents the boundary between exponential growth and decay.) As a increases, the graph of $y = a^x$ increases at a faster rate. On the other hand, the graphs of the equations $y = 0.7^x$, $y = 0.5^x$, and $y = 0.15^x$ decrease faster as a decreases. See Figure 5.35. The graph of $y = a^x$ is **increasing** when $a > 1$ and **decreasing** when $0 < a < 1$. Note that the graph of $y = a^x$, $a > 0$, always passes through the point $(0, 1)$.

Algebra Review

To review properties of exponents, see Chapter R (page R-7) and Section 4.8.

Figure 5.34

Figure 5.35

Figure 5.36

In Section 3.5 we saw that the graph of $y = f(-x)$ is a reflection of the graph of $y = f(x)$ across the y -axis. As a result, the graph of $y = a^{-x}$ is a reflection of $y = a^x$ across the y -axis. For example, the graphs of $y = 2^x$ and $y = 2^{-x}$ are reflections across the y -axis. See Figure 5.36. Note that, by properties of exponents, $2^{-x} = \left(\frac{1}{2}\right)^x$.

MAKING CONNECTIONS

Exponential Functions and Polynomial Functions An exponential function has a *variable* for an exponent, whereas a polynomial function has *constants* for exponents. For example, $f(x) = 3^x$ represents an exponential function, and $g(x) = x^3$ represents a polynomial function.

EXAMPLE 3 Comparing exponential and polynomial functions

Compare $f(x) = 3^x$ and $g(x) = x^3$ graphically and numerically for $x \geq 0$.

SOLUTION

Graphical Comparison The graphs $Y_1 = 3^X$ and $Y_2 = X^3$ are shown in Figure 5.37. For $x \geq 6$, the graph of the exponential function y_1 increases significantly faster than the graph of the polynomial function y_2 .

Numerical Comparison Tables for y_1 and y_2 are shown in Figure 5.38. The values for y_1 increase faster than the values for y_2 .

[0, 12, 1] by [0, 10000, 1000]

Figure 5.37

6	729	216
8	6561	512
10	59049	1000
12	531441	1728

Figure 5.38

Now Try Exercise 23 ◀

The results of Example 3 are true in general; that is, for large enough inputs, exponential functions with $a > 1$ eventually become greater than *any* polynomial function.

Compound Interest

Suppose \$1000 is deposited in an account paying 10% annual interest. At the end of 1 year, the account will contain \$1000 plus 10% of \$1000, or \$100, in interest. Let P represent the **principal**, or initial amount deposited. Then the amount A_1 in the account after 1 year can be computed as follows.

$$\begin{aligned}
 A_1 &= P + (0.10)P && \text{Principal plus interest} \\
 &= P(1 + 0.10) && \text{Factor.} \\
 &= 1000(1.10) && P = \$1000 \\
 &= 1100 && \text{Simplify.}
 \end{aligned}$$

The sum of the principal and interest is \$1100.

During the second year, the account earns interest on \$1100. The amount A_2 after the second year will be equal to A_1 plus 10% of A_1 .

$$\begin{aligned}
 A_2 &= A_1 + (0.10)A_1 \\
 &= A_1(1 + 0.10) && \text{Factor.} \\
 &= P(1 + 0.10)(1 + 0.10) && A_1 = P(1 + 0.10) \\
 &= P(1 + 0.10)^2 && \text{Simplify.} \\
 &= 1000(1.10)^2 && P = \$1000 \\
 &= 1210 && \text{Simplify.}
 \end{aligned}$$

After 2 years, there will be \$1210.

We would like to determine a general formula for A , the amount in the account after t years. To do this, compute A_3 and observe a pattern.

$$\begin{aligned}
 A_3 &= A_2 + (0.10)A_2 \\
 &= A_2(1 + 0.10) && \text{Factor.} \\
 &= P(1 + 0.10)^2(1 + 0.10) && A_2 = P(1 + 0.10)^2 \\
 &= P(1 + 0.10)^3 && \text{Simplify.} \\
 &= 1000(1.10)^3 && P = \$1000 \\
 &= 1331 && \text{Simplify.}
 \end{aligned}$$

The amount is \$1331. We can see that, in general after t years, $A = P(1 + 0.10)^t$. This type of interest is said to be *compounded annually*, because it is paid once a year.

If the interest rate is r , *expressed in decimal form*, then $A = P(1 + r)^t$. Notice that in the expression $P(1 + r)^t$ the variable t occurs as an exponent.

EXAMPLE 4 Calculating an account balance

If the principal is \$2000 and the interest rate is 8% compounded annually, calculate the account balance after 4 years.

SOLUTION The principal is $P = 2000$, the interest rate is $r = 0.08$, and the number of years is $t = 4$.

$$A = P(1 + r)^t = 2000(1 + 0.08)^4 \approx 2720.98$$

After 4 years, the account contains \$2720.98.

Now Try Exercise 63 ◀

In most savings accounts, interest is paid more often than once a year. In this case a smaller amount of interest is paid more frequently. For example, suppose \$1000 is deposited in an account paying 10% annual interest, compounded quarterly. After 3 months, the interest would amount to one-fourth of 10%, or 2.5%, of \$1000. The account balance would be $1000(1 + 0.025) = \$1025$. After the next 3-month period, interest would be paid on the \$1025. In a manner similar to that used for annual compounding, the balance would be $\$1000(1 + 0.025)^2 \approx \1050.63 after 6 months, $\$1000(1 + 0.025)^3 \approx \1076.89 after 9 months, and $\$1000(1 + 0.025)^4 \approx \1103.81 after a year. With annual compounding the amount is \$1100. The difference of \$3.81 is due to compounding quarterly. Although this amount is small after 1 year, compounding more frequently can have a dramatic effect over a long time.

Compound Interest

If a principal of P dollars is deposited in an account paying an annual rate of interest r (expressed in decimal form) compounded (paid) n times per year, then after t years the account will contain A dollars, where

$$A = P \left(1 + \frac{r}{n} \right)^{nt}.$$

EXAMPLE 5 Comparing compound interest

Suppose \$1000 is deposited by a 20-year-old worker in an Individual Retirement Account (IRA) that pays an annual interest rate of 12%. Describe the effect on the balance after 45 years at age 65 if interest were compounded quarterly rather than annually.

SOLUTION

Compounded Annually Let $P = 1000$, $r = 0.12$, $n = 1$, and $t = 65 - 20 = 45$.

$$A = P\left(1 + \frac{r}{n}\right)^{nt} = 1000(1 + 0.12)^{45} \approx \$163,987.60$$

CLASS DISCUSSION

Make a conjecture about the effect on the IRA balance after 45 years if the interest rate in Example 5 were 6% instead of 12%. Test your conjecture.

Compounded Quarterly Let $P = 1000$, $r = 0.12$, $n = 4$, and $t = 45$.

$$A = 1000\left(1 + \frac{0.12}{4}\right)^{4(45)} = 1000(1 + 0.03)^{180} \approx \$204,503.36$$

Quarterly compounding results in an increase of \$40,515.76!

Now Try Exercise 71 ◀

The Natural Exponential Function

In Example 5, compounding interest quarterly rather than annually made a significant difference in the balance after 45 years. What would happen if interest were compounded daily or even hourly? Would there be a limit to the amount of interest that could be earned? To answer these questions, suppose \$1 was deposited in an account at the very high interest rate of 100%. Table 5.16 shows the amount of money after 1 year, compounding n times during the year. The first column represents the time interval between compound interest payments. In Table 5.16, the formula $A = P\left(1 + \frac{r}{n}\right)^{nt}$ simplifies to $A = \left(1 + \frac{1}{n}\right)^n$, since $P = t = r = 1$. Notice that A levels off near \$2.72. The graph $y = \left(1 + \frac{1}{x}\right)^x$ is shown in Figure 5.39. The graph approaches the horizontal asymptote $y = e$. This means that the y -values never exceed the value of $e \approx 2.7183$.

Table 5.16

Time	n	A
Year	1	2.000000
Month	12	2.613035
Day	365	2.714567
Hour	8760	2.718127
Minute	525,600	2.718279
Second	31,536,000	2.718282

Figure 5.39 $y = \left(1 + \frac{1}{x}\right)^x \rightarrow e$

Compounding that is done more frequently, by letting n become large without bound, is called **continuous compounding**. The exponential expression $\left(1 + \frac{1}{n}\right)^n$ reaches a limit of approximately 2.718281828 as $n \rightarrow \infty$. This value is so important in mathematics that it has been given its own symbol, e , sometimes called **Euler's number**. The number e has many of the same characteristics as π . Its decimal expansion never terminates or repeats in a pattern. It is an irrational number.

Value of e

To eleven decimal places, $e \approx 2.71828182846$.

Continuous compounding can be applied to population growth. Compounding annually would mean that all births and deaths occurred on December 31. Similarly, compounding quarterly would mean that births and deaths occurred at the end of March, June, September, and December. In large populations, births and deaths occur *continuously* throughout the year. Compounding continuously is a *natural* way to model large populations.

Calculator Help

When evaluating e^x , be sure to use the built-in key for e^x , rather than using an approximation for e , such as 2.72.

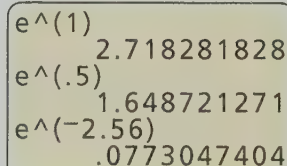

The Natural Exponential Function

The function f , represented by $f(x) = e^x$, is the **natural exponential function**.

EXAMPLE 6 Evaluating the natural exponential function

Approximate to four decimal places $f(x) = e^x$ when $x = 1$, 0.5 , and -2.56 .

SOLUTION In Figure 5.40 these values are approximated as follows: $f(1) = e^1 \approx 2.7183$, $f(0.5) = e^{0.5} \approx 1.6487$, and $f(-2.56) = e^{-2.56} \approx 0.0773$.

$e^{(1)}$	2.718281828
$e^{(.5)}$	1.648721271
$e^{(-2.56)}$.0773047404

Figure 5.40

Now Try Exercise 41

When interest is compounded continuously, the following formula can be used to compute the amount of money in an account.

Continuously Compounded Interest

If a principal of P dollars is deposited in an account paying an annual rate of interest r (expressed in decimal form), compounded continuously, then after t years the account will contain A dollars, where

$$A = Pe^{rt}.$$

EXAMPLE 7 Calculating continuously compounded interest

The principal in an IRA is \$1000 and the interest rate is 12%, compounded continuously.

- How much money will there be after 45 years?
- Determine graphically and numerically the 10-year period when the account balance increases the most.

SOLUTION

- (a) Let $P = 1000$, $r = 0.12$, and $t = 45$. Then $A = 1000e^{(0.12)45} \approx \$221,406.42$. This is more than the \$204,503.36 that resulted from compounding quarterly in Example 5.
- (b) Graph $Y_1 = 1000e^{(.12X)}$, as shown in Figure 5.41. From the graph we can see that the account balance increases the most during the last 10 years. Numerical support for this conclusion is shown in Figure 5.42.

Calculator Help

To make a table like Figure 5.42, see Appendix A (page AP-10).

[0, 45, 5] by [0, 250000, 1000000]

Figure 5.41

X	Y1

$Y1 = 1000e^{(.12X)}$

Figure 5.42

Now Try Exercise 75 ◀

CLASS DISCUSSION

Graph $y = 2^x$ and $y = 3^x$ on the same coordinate axes, using the viewing rectangle $[-3, 3, 1]$ by $[0, 4, 1]$. Make a conjecture about how the graph of $y = e^x$ will appear. Test your conjecture.

Natural Exponential Growth and Decay The natural exponential function is often used to model growth of a quantity. If A_0 is the initial amount of a quantity A at time $t = 0$ and if k is a positive constant, then exponential growth of A can be modeled by

$$A(t) = A_0 e^{kt} \quad \text{Growth } (k > 0)$$

Figure 5.43 illustrates this type of growth graphically. Similarly,

$$A(t) = A_0 e^{-kt} \quad \text{Decay } (k > 0)$$

can be used to model exponential decay provided $k > 0$. Figure 5.44 illustrates this type of decay graphically. A larger value of k causes the graph of A to increase or decrease more rapidly. That is, a larger value of k causes the rate of change in A to be greater in absolute value.

Figure 5.43 Exponential Growth

Figure 5.44 Exponential Decay

Sometimes variables such as N or Q are used instead of the variable A in these two formulas. In the next example, we model the number of bacteria N in a sample that undergoes exponential growth.

EXAMPLE 1**Modeling the growth of *E. coli* bacteria**

E. coli (*Escherichia coli*) is a type of bacteria that inhabits the intestines of animals. These bacteria are capable of rapid growth and can be dangerous to humans—especially children.

In one study, *E. coli* bacteria were found to be capable of doubling in number about every 49.5 minutes. Their number N after t minutes could be modeled by $N(t) = N_0 e^{0.014t}$. Suppose that $N_0 = 500,000$ is the initial number of bacteria per milliliter. (Source: G. S. Stent, *Molecular Biology of Bacterial Viruses*.)

- Make a conjecture about the number of bacteria per milliliter after 99 minutes. Verify your conjecture.
- Determine graphically the elapsed time when there were 25 million bacteria per milliliter.

$[0, 400, 100]$ by $[0, 3 \times 10^7, 1 \times 10^7]$

Figure 5.45

SOLUTION

- Since the bacteria double every 49.5 minutes, there would be 1,000,000 per milliliter after 49.5 minutes and 2,000,000 after 99 minutes. This is verified by evaluating

$$N(99) = 500,000e^{0.014(99)} \approx 2,000,000.$$

- Graphical Solution** Solve $N(t) = 25,000,000$ by graphing $Y_1 = 500000e^{(0.014X)}$ and $Y_2 = 25000000$. Their graphs intersect near $(279.4, 25,000,000)$, as shown in Figure 5.45. Thus in a 1-milliliter sample, half a million *E. coli* bacteria could increase to 25 million in approximately 279 minutes, or 4 hours and 39 minutes.

Now Try Exercise 83

NOTE You will learn how to solve this equation symbolically in Section 5.6. See Exercise 75 in that section.

Exponential Models

Exponential functions have many applications. The next example analyzes the increase in atmospheric carbon dioxide (CO_2). Carbon dioxide is a greenhouse gas.

EXAMPLE 1 Modeling atmospheric CO_2 concentrations

Predicted concentrations of atmospheric carbon dioxide (CO_2) in parts per million (ppm) are shown in Table 5.17. (These concentrations assume that current trends continue.) The CO_2 levels in the year 2000 were greater than they had been at any time in the previous 160,000 years.

Table 5.17 Concentrations of Atmospheric CO_2

Year	2000	2050	2100	2150	2200
CO_2 (ppm)	364	467	600	769	987

Source: R. Turner, *Environmental Economics*.

- Let $x = 0$ correspond to 2000 and $x = 200$ to 2200. Find values for C and a so that $f(x) = Ca^x$ models these data.
- Estimate CO_2 concentrations for the year 2025.

SOLUTION

- Getting Started** When modeling data by hand with $f(x) = Ca^x$, one strategy is to let C equal $f(0)$. Then substitute a data point into this formula and find a . ▶

The concentration is 364 when $x = 0$, so $C = 364$. This gives $f(x) = 364a^x$. One possibility for determining a is to use the last data point and require that the graph of f pass through the point $(200, 987)$. It then follows that $f(200) = 987$.

$$\begin{aligned} 364a^{200} &= 987 & f(200) &= 987 \\ a^{200} &= \frac{987}{364} & & \text{Divide by 364.} \\ (a^{200})^{1/200} &= \left(\frac{987}{364}\right)^{1/200} & & \text{Take the } \frac{1}{200}\text{th power.} \\ a &= \left(\frac{987}{364}\right)^{1/200} & & \text{Properties of exponents} \\ a &\approx 1.005 & & \text{Approximate.} \end{aligned}$$

Thus $f(x) = 364(1.005)^x$. Answers for $f(x)$ may vary slightly.

- (b) Since 2025 corresponds to $x = 25$, evaluate $f(25)$.

$$f(25) = 364(1.005)^{25} \approx 412$$

Concentration of CO_2 could reach 412 ppm by 2025.

Now Try Exercise 85 ◀

EXAMPLE III Modeling traffic flow

Cars arrive randomly at an intersection with an average rate of 30 cars per hour. Highway engineers estimate the likelihood, or probability, that at least one car will enter the intersection within a period of x minutes with $f(x) = 1 - e^{-0.5x}$. (Source: F. Mannering and W. Kilareski, *Principles of Highway Engineering and Traffic Analysis*.)

- (a) Evaluate $f(2)$ and interpret the answer.
 (b) Graph f for $0 \leq x \leq 60$. What is the likelihood that at least one car will enter the intersection during a 60-minute period?

$[0, 60, 10]$ by $[0, 1.2, 0.2]$

Figure 5.46

SOLUTION

- (a) $f(2) = 1 - e^{-0.5(2)} = 1 - e^{-1} \approx 0.63$. There is a 63% chance that at least one car will enter the intersection during a 2-minute period.
 (b) Graph $Y_1 = 1 - e^{(-0.5X)}$, as shown in Figure 5.46. As time progresses, the probability increases and begins to approach 1. It is almost certain that at least one car will enter the intersection during a 60-minute period. (Note that a horizontal asymptote is $y = 1$.)

Now Try Exercise 87 ◀

Radioactive Decay Radioactivity is an application of exponential decay. When an element such as uranium undergoes radioactive decay, atoms change from one element to another. The time it takes for half of the atoms to decay into a different element is called the **half-life**, and this time varies for different elements. Radioactive carbon-14, which is found in all living things, has a half-life of about 5700 years and can be used to date fossils.

If the initial amount of carbon-14 equals C grams, then $f(x) = Ca^x$ models the amount of carbon-14 present after x years, where a needs to be determined for carbon-14. After 5700 years, there will be $\frac{1}{2}C$ grams, so $f(5700) = \frac{1}{2}C$ implies that

$$Ca^{5700} = \frac{1}{2}C.$$

To solve this equation for a , begin by dividing each side by C .

$$a^{5700} = \frac{1}{2} \quad \text{Divide each side by } C.$$

$$(a^{5700})^{1/5700} = \left(\frac{1}{2}\right)^{1/5700} \quad \text{Raise to the } \frac{1}{5700} \text{th power.}$$

$$a = \left(\frac{1}{2}\right)^{1/5700} \quad \text{Properties of exponents}$$

Using properties of exponents, we write $f(x) = Ca^x$ as

$$f(x) = C\left(\left(\frac{1}{2}\right)^{1/5700}\right)^x = C\left(\frac{1}{2}\right)^{x/5700}.$$

This discussion is summarized in the following box.

Modeling Radioactive Decay

If a radioactive sample containing C units has a half-life of k years, then the amount A remaining after x years is given by

$$A(x) = C\left(\frac{1}{2}\right)^{x/k}.$$

The half-life of radium-226 is about 1600 years. After 9600 years, a 2-gram sample decays to

$$A(9600) = 2\left(\frac{1}{2}\right)^{9600/1600} = 0.03125 \text{ gram.}$$

EXAMPLE 1 Finding the age of a fossil

A fossil contains 5% of the amount of carbon-14 that the organism contained when it was alive. Graphically estimate its age. The situation is illustrated in Figure 5.47.

SOLUTION The initial amount of carbon-14 is 100% (or 1), the final amount is 5% (or 0.05), and the half-life is 5700 years, so $A = 0.05$, $C = 1$, and $k = 5700$ in $A(x) = C\left(\frac{1}{2}\right)^{x/k}$. To determine the age of the fossil, solve

$$0.05 = 1\left(\frac{1}{2}\right)^{x/5700}$$

for x . Graph $Y_1 = 0.05$ and $Y_2 = 0.5^{(X/5700)}$, as shown in Figure 5.48. Their graphs intersect near (24635, 0.05), so the fossil is about 24,635 years old.

[0, 50000, 10000] by [0, 0.1, 0.01]

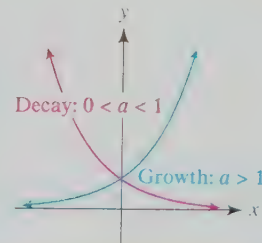

Figure 5.47

5.3 Putting It All Together

The following table summarizes some important concepts about exponential functions and types of growth and decay.

Concept	Comments	Examples										
Exponential function $f(x) = Ca^x$, where $a > 0$, $a \neq 1$, and $C > 0$	Exponential growth occurs when $a > 1$, and exponential decay occurs when $0 < a < 1$. C often represents the initial amount present because $f(0) = C$.	$f(x) = 5(0.8)^x$ Decay $g(x) = 3^x$ Growth 										
Linear growth $y = mx + b$	If data increase by a fixed amount m for each unit increase in x , they can be modeled by a linear function.	The following data can be modeled by $f(x) = 3x + 2$ because the data increase 3 units for each unit increase in x and because $y = 2$ when $x = 0$. <table data-bbox="1028 996 1276 1125"><tr><td>x</td><td>0</td><td>1</td><td>2</td><td>3</td></tr><tr><td>y</td><td>2</td><td>5</td><td>8</td><td>11</td></tr></table> <p style="text-align: center;">+3 +3 +3</p>	x	0	1	2	3	y	2	5	8	11
x	0	1	2	3								
y	2	5	8	11								
Exponential growth $y = Ca^x$	If data increase by a constant factor a for each unit increase in x , they can be modeled by an exponential function.	The following data can be modeled by $f(x) = 2(3)^x$ because the data increase by a factor of 3 for each unit increase in x and because $y = 2$ when $x = 0$. <table data-bbox="1013 1291 1290 1421"><tr><td>x</td><td>0</td><td>1</td><td>2</td><td>3</td></tr><tr><td>y</td><td>2</td><td>6</td><td>18</td><td>54</td></tr></table> <p style="text-align: center;">×3 ×3 ×3</p>	x	0	1	2	3	y	2	6	18	54
x	0	1	2	3								
y	2	6	18	54								
Interest compounded n times per year $A = P\left(1 + \frac{r}{n}\right)^{nt}$	P is the principal, r is the interest rate (expressed in decimal form), n is the number of times interest is paid each year, t is the number of years, and A is the amount after t years.	\$500 at 8%, compounded monthly, for 3 years yields $500\left(1 + \frac{0.08}{12}\right)^{12(3)} \approx \$635.12.$										
The number e	The number e is an irrational number important in mathematics, much like π .	$e \approx 2.718282$										

Concept	Comments	Examples
Natural exponential function	This function is an exponential function with base e and $C = 1$.	$f(x) = e^x$
Interest compounded continuously $A = Pe^{rt}$	P is the principal, r is the interest rate (expressed in decimal form), t is the number of years, and A is the amount after t years.	\$500 at 8% compounded continuously for 3 years yields $500e^{0.08(3)} \approx \$635.62$.
Radioactive decay	If a radioactive sample has a half-life of k years and contains C units, then the amount A remaining after x years is given by $A(x) = C\left(\frac{1}{2}\right)^{x/k}$	A 5-gram sample of radioactive material with a half-life of 300 years is modeled by $A(x) = 5\left(\frac{1}{2}\right)^{x/300}$

21. **Job Offer** A company offers a college graduate \$40,000 per year with a guaranteed 8% raise each year. Is this an example of linear or exponential growth? Find a function f that computes the salary during the n th year.

22. **Job Offer** A new employee is offered \$35,000 per year with a guaranteed \$5000 raise each year. Is this an example of linear or exponential growth? Find a function f that computes the salary during the n th year.

23. **Comparing Growth** Which function becomes larger for $0 \leq x \leq 10$: $f(x) = 2^x$ or $g(x) = x^2$?
24. **Comparing Growth** Which function becomes larger for $0 \leq x \leq 10$: $f(x) = 4 + 3x$ or $g(x) = 4(3)^x$?
25. **Comparing Growth** Which function becomes larger for $0 \leq x \leq 10$: $f(x) = 2x + 1$ or $g(x) = 2^{-x}$?
26. **Salaries** If you were offered 1¢ for the first week of work, 3¢ for the second week, 5¢ for the third week, 7¢ for the fourth week, and so on for a year, would you accept the offer? Would you accept an offer that pays 1¢ for the first week of work, 2¢ for the second week, 4¢ for the third week, 8¢ for the fourth week, and so on for a year? Explain your answers.

Exponential Functions

Exercises 27–34: Find C and a so that $f(x) = Ca^x$ satisfies the given conditions.

27. $f(0) = 5$ and for each unit increase in x , the output is multiplied by 1.5.
28. $f(1) = 3$ and for each unit increase in x , the output is multiplied by $\frac{3}{4}$.
29. $f(0) = 10$ and $f(1) = 20$
30. $f(0) = 7$ and $f(-1) = 1$
31. $f(1) = 9$ and $f(2) = 27$
32. $f(-1) = \frac{1}{4}$ and $f(1) = 4$
33. $f(-2) = \frac{9}{2}$ and $f(2) = \frac{1}{18}$
34. $f(-2) = \frac{3}{4}$ and $f(2) = 12$

Exercises 35–38: Find C and a so that $f(x) = Ca^x$ models the situation described. State what the variable x represents in your formula. (Answers may vary.)

35. There are initially 5000 bacteria, and this sample doubles in size every hour.
36. Fifteen hundred dollars is deposited in an account that triples in value every decade.

37. In 2000 a house was worth \$200,000, and its value decreases by 5% each year thereafter.
38. A fish population is initially 6000 and decreases by half each year.
39. **Tire Pressure** The pressure in a tire with a leak is 30 pounds per square inch initially and can be modeled by $f(x) = 30(0.9)^x$ after x minutes. What is the tire's pressure after 9.5 minutes?
40. **Population** The population of California was about 38 million in 2007 and increasing by 1.6% each year. Estimate the population of California in 2012.

Exercises 41–44: Approximate $f(x)$ to four decimal places.

41. $f(x) = 4e^{-1.2x}$, $x = -2.4$
42. $f(x) = -2.1e^{-0.71x}$, $x = 1.9$
43. $f(x) = \frac{1}{2}(e^x - e^{-x})$, $x = -0.7$
44. $f(x) = 4(e^{-0.3x} - e^{-0.6x})$, $x = 1.6$

Graphs of Exponential Functions

Exercises 45–52: Sketch a graph of $y = f(x)$.

45. $f(x) = 2^x$
46. $f(x) = 4^x$
47. $f(x) = 3^{-x}$
48. $f(x) = 3(2^{-x})$
49. $f(x) = 2(\frac{1}{3})^x$
50. $f(x) = 2(3^x)$
51. $f(x) = (\frac{1}{2})^x$
52. $f(x) = (\frac{1}{4})^x$

Exercises 53–56: Use the graph of $y = Ca^x$ to determine values for C and a .

53.

54.

55.

56.

57. Let $f(x) = 7\left(\frac{1}{8}\right)^x$.

- What are the domain and range of f ?
- Is f either increasing or decreasing on its domain?
- Find any asymptotes on the graph of f .
- Find any x - or y -intercepts on the graph of f .
- Is f a one-to-one function? Does f have an inverse?

58. Repeat Exercise 57 with $f(x) = e^x$.59. Match the symbolic representation of f with its graphical representation (a–d). Do *not* use a calculator.

(i) $f(x) = e^x$

(ii) $f(x) = 3^{-x}$

(iii) $f(x) = 1.5^x$

(iv) $f(x) = 0.99^x$

a.

b.

c.

d.

60. **Modeling Phenomena** Match the situation with the graph (a–d) at the top of the next column that models it best.

- Balance in an account after x years earning 10% interest compounded continuously
- Balance in an account after x years earning 5% interest compounded annually

(iii) Air pressure in a car tire with a large hole in it after x minutes(iv) Air pressure in a car tire with a pinhole in it after x minutes

a.

b.

c.

d.

Exercises 61 and 62: The graph of $y = f(x)$ is shown in the figure. Sketch a graph of each equation using translations of graphs and reflections. Do not use a graphing calculator.

61. $f(x) = 2^x$

(a) $y = 2^x - 2$

(b) $y = 2^{x-1}$

(c) $y = 2^{-x}$

(d) $y = -2^x$

62. $f(x) = e^{-0.5x}$

(a) $y = -e^{-0.5x}$

(b) $y = e^{-0.5x} - 3$

(c) $y = e^{-0.5(x-2)}$

(d) $y = e^{0.5x}$

**Compound Interest**

Exercises 63–70: Use the compound interest formula to determine the final value of each amount.

63. \$600 at 7% compounded annually for 5 years

64. \$2300 at 11% compounded semiannually for 10 years

65. \$950 at 3% compounded daily for 20 years

66. \$3300 at 8% compounded quarterly for 2 years
67. \$2000 at 10% compounded continuously for 8 years
68. \$100 at 19% compounded continuously for 50 years
69. \$1600 at 10.4% compounded monthly for 2.5 years
70. \$2000 at 8.7% compounded annually for 5 years
71. **Investments** Compare investing \$2000 at 10% compounded monthly for 20 years with investing \$2000 at 13% compounded monthly for 20 years.
72. **Lake Property** In some states, lake shore property is increasing in value by 15% per year. Determine the value of a \$90,000 lake lot after 5 years.
73. **College Tuition** If college tuition is currently \$8000 per year, inflating at 6% per year, what will be the cost of tuition in 10 years?
-  74. **Doubling Time** How long does it take for an investment to double its value if the interest is 12% compounded annually? 6% compounded annually?

Applications

75. **Saving for Retirement** Suppose \$1500 is deposited into an IRA with an interest rate of 6%, compounded continuously.
- (a) How much money will there be after 30 years?
-  (b) Determine graphically or numerically the 10-year period when the account balance increases the most.
76. **Population Growth** The population of Phoenix, Arizona, was 1.3 million in 2000 and growing continuously at a 3% rate.
- (a) Assuming this trend continues, estimate the population of Phoenix in 2010.
-  (b) Determine graphically or numerically when this population might reach 2 million.
77. **Federal Debt** In fiscal year 2008 the federal budget deficit was about \$340 billion. At the same time, 30-year treasury bonds were paying 4.54% interest. Suppose the American taxpayer loaned \$340 billion to the federal government at 4.54% compounded annually. If the federal government waited 30 years to pay the entire amount back, including the interest, how much would this be? (Source: Department of the Treasury.)

78. **Federal Debt** Suppose that interest rates in Exercise 77 were 2% higher. How much would the federal government owe after 30 years? Is the national debt sensitive to interest rates?

79. **Annuity** If x dollars is deposited every 2 weeks (26 times per year) into an account paying an annual interest rate r , expressed in decimal form, then the amount A in the account after t years can be approximated by the formula

$$A = x \left(\frac{(1 + r/26)^{26t} - 1}{(r/26)} \right).$$

If \$50 is deposited every 2 weeks into an account paying 8% interest, approximate the amount after 10 years.

80. **Annuity** (Refer to Exercise 79.) Suppose a retirement account pays 10% annual interest. Determine how much a 20-year-old worker should deposit in this account every 2 weeks in order to have \$1 million at age 65.

-  81. **Continuous Compounding** Over 5 years, the total value of a mutual fund account decreases continuously by 15%. Find a formula $A(x)$ that calculates the amount of money in the account after x years.

-  82. **Continuous Compounding** A sum of money P in an account receives continuous interest and triples in 15 years. Find a formula $A(x)$ that calculates the amount of money in the account after x years.

83. **E. Coli Growth** (Refer to Example 8.)
- (a) Approximate the number of *E. coli* after 3 hours.

-  (b) Estimate graphically the elapsed time when there are 10 million bacteria per milliliter.

84. **Drug Concentrations** Sometimes after a patient takes a drug, the amount of medication A in the bloodstream can be modeled by $A = A_0 e^{-rt}$, where A_0 is the initial concentration in milligrams per liter, r is the hourly percentage decrease (in decimal form) of the drug in the bloodstream, and t is the elapsed time in hours. Suppose that a drug's concentration is initially 2 milligrams per liter and that $r = 0.2$.

- (a) Find the drug concentration after 3.5 hours.

-  (b) When did the drug concentration reach 1.5 milligrams per liter?

85. **Greenhouse Gases** (Refer to Example 9.) Chlorofluorocarbons (CFCs) are gases created by people that increase the greenhouse effect and damage the ozone layer. The

following table lists future concentrations of CFC-12 in parts per billion (ppb) if current trends continue.

Year	2000	2005	2010	2015	2020
CFC-12 (ppb)	0.72	0.88	1.07	1.31	1.60

Source: R. Turner, Environmental Economics.

- (a) Find values for C and a so that $f(x) = Ca^x$ models these data, where x is years after 2000.
- (b) Estimate the CFC-12 concentration in 2013.
86. **Bacteria Growth** The table lists the concentration in a sample of *E. coli* bacteria B (in billions per liter) after x hours.

x	0	3	5	8
B	0.5	6.2	33.3	414

Source: G. S. Stent, *Molecular Biology of Bacterial Viruses*.

- (a) Find values for C and a so that $f(x) = Ca^x$ models these data.
- (b) Estimate the bacteria concentration after 6.2 hours.
87. **Modeling Traffic Flow** Cars arrive randomly at an intersection with an average rate of 50 cars per hour. The likelihood, or probability, that at least one car will enter the intersection within a period of x minutes can be estimated by $P(x) = 1 - e^{-5x/6}$.
- (a) Find the likelihood that at least one car enters the intersection during a 3-minute period.
- (b) Graphically determine the value of x that gives a 50–50 chance of at least one car entering the intersection during an interval of x minutes.
88. **Tree Density** Ecologists studied the spacing between individual trees in a forest in British Columbia. The probability, or likelihood, that there is at least one tree located in a circle with a radius of x feet can be estimated by $P(x) = 1 - e^{-0.1144x}$. For example, $P(7) \approx 0.55$ means that if a person picks a point at random in the forest, there is a 55% chance that at least one tree will be located within 7 feet. See the figure. (Source: E. Pielou, *Populations and Community Ecology*.)

- (a) Evaluate $P(2)$ and $P(20)$, and interpret the results.
- (b) Graph P . Explain verbally why it is logical for P to be an increasing function. Does the graph have a horizontal asymptote?
- (c) Solve $P(x) = 0.5$ and interpret the result.
89. **Radioactive Carbon-14** (Refer to Example 11.) A fossil contains 10% of the carbon-14 that the organism contained when it was alive. Graphically estimate its age.
90. **Radioactive Carbon-14** A fossil contains 20% of the carbon-14 that the organism contained when it was alive. Estimate its age.
91. **Radioactive Radium-226** The half-life of radium-226 is about 1600 years. After 3000 years, what percentage P of a sample of radium remains?
92. **Radioactive Strontium-90** Radioactive strontium-90 has a half-life of about 28 years and sometimes contaminates the soil. After 50 years, what percentage of a sample of radioactive strontium would remain?
93. **Swimming Pool Maintenance** Chlorine is frequently used to disinfect swimming pools. The chlorine concentration should remain between 1.5 and 2.5 parts per million. On warm sunny days with many swimmers agitating the water, 30% of the chlorine can dissipate into the air or combine with other chemicals. (Source: D. Thomas, *Swimming Pool Operators Handbook*.)

- (a) Find C and a so that $f(x) = Ca^x$ models the amount of chlorine in the pool after x days. Assume that the initial amount is 2.5 parts per million.
- (b) What is the chlorine concentration after 2 days if no chlorine is added?
- (c) Estimate graphically or numerically the number of days before chlorine should be added.

94. **Radioactive Cesium-137** Radioactive cesium-137 was emitted in large amounts in the Chernobyl nuclear power station accident in Russia. The amount of a 100-milligram sample of cesium remaining after x years can be described by $A(x) = 100e^{-0.02295x}$. (Source: C. Mason, *Biology of Freshwater Pollution*.)

(a) How much remains after 50 years? Is the half-life of cesium more or less than 50 years?

 (b) Estimate graphically the half-life of cesium-137.

 95. **Thickness of Runways** Heavier aircraft require runways with thicker pavement for landings and takeoffs. A pavement 6 inches thick can accommodate an aircraft weighing 80,000 pounds, whereas a 12-inch-thick pavement is necessary for a 350,000-pound plane. The relation between pavement thickness t in inches and gross weight W in thousands of pounds can be modeled by $W = Ca^t$. (Source: FAA.)

 (a) Find values for C and a .

(b) How heavy an airplane can a 9-inch-thick runway accommodate?

(c) What is the minimum thickness for a 242,000-pound plane?

96. **Filters** Impurities in water are frequently removed using filters. Suppose that a 1-inch filter allows 10% of the impurities to pass through it. The other 90% is trapped in the filter.

(a) Find a formula in the form $f(x) = 100a^x$ that calculates the percentage of impurities passing through x inches of this type of filter.

(b) Use $f(x)$ to estimate the percentage of impurities passing through 2.3 inches of the filter.

97. **Trains** The faster a locomotive travels, the more horsepower is needed. The formula $H(x) = 0.157(1.033)^x$ calculates this horsepower for a level track. The input x is in miles per hour and the output $H(x)$ is the horsepower required per ton of cargo. (Source: L. Haefner, *Introduction to Transportation Systems*.)

(a) Evaluate $H(30)$ and interpret the result.

(b) Determine the horsepower needed to move a 5000-ton train 30 miles per hour.

(c) Some types of locomotives are rated for 1350 horsepower. How many locomotives of this type would be needed in part (b)?

98. **Survival of Reindeer** For all types of animals, the percentage that survive into the next year decreases. In one study, the survival rate of a sample of reindeer was modeled by $S(t) = 100(0.999993)^t$. The function S outputs the percentage of reindeer that survive t years.

(Source: D. Brown.)

(a) Evaluate $S(4)$ and $S(15)$. Interpret the results.

 (b) Graph S in $[0, 15, 5]$ by $[0, 110, 10]$. Interpret the graph. Does the graph have a horizontal asymptote?

Writing about Mathematics

99. Explain how linear and exponential functions differ. Give examples.

100. Discuss the domain and range of an exponential function f . Is f one-to-one? Explain.

EXTENDED AND DISCOVERY EXERCISES

Exercises 1–4: Present Value In the compound interest formula $A = P(1 + r/n)^n$, we can think of P as the present value of an investment and A as the future value of an investment after t years. For example, if you were saving for college and needed a future value of A dollars, then P would represent the amount needed in an account today to reach your goal in t years at an interest rate of r , compounded n times per year. If we solve the equation for P , it results in

$$P = A(1 + r/n)^{-n}.$$

1. Verify that the two formulas are equivalent by transforming the first equation into the second.

2. What should the present value of a savings account be to cover \$30,000 of college expenses in 12.5 years, if the account pays 7.5% interest compounded quarterly?

3. Suppose you want to have \$15,000 to buy a car in 3 years. What should the present value of a savings account be to reach this goal, if the account pays 5% compounded monthly?

4. A parent expects college costs to reach \$40,000 in 6 years. To cover the \$40,000 in future expenses, how much should the parent deposit in an account that pays 6% interest compounded continuously?

Exercises 5–8: Average Rate of Change of e^x Complete the following. Round your answers to two decimal places.

(a) Find the average rate of change of $f(x) = e^x$ from x to $x + 0.001$ for the given x .

(b) Approximate $f(x) = e^x$ for the given x .

(c) Compare your answers in parts (a) and (b).

5. $x = 0$

6. $x = -2$

7. $x = -0.5$

8. $x = 1.5$

9. **Average Rate of Change** What is the pattern in the results from Exercises 5–8? You may want to test your conjecture by trying different values of x .

10. **Average Rate of Change** (Refer to Exercises 5–8.) For any real number k , what is a good approximation for the average rate of change of $f(x) = e^x$ on a small interval near $x = k$? Explain how your answer relates to the graph of $f(x) = e^x$.

5.4 Logarithmic Functions and Models

- Evaluate the common logarithmic function
- Evaluate logarithms with other bases
- Solve basic exponential and logarithmic equations
- Solve general exponential and logarithmic equations
- Convert between exponential and logarithmic forms

Introduction

Bacteria growth is often exponential. For example, Table 5.18 and Figure 5.49 show the concentration B (in thousands per milliliter) in a bacteria sample. The symbolic representation is $B(x) = 10^x$, where x represents time in elapsed days. To determine how long it takes for the concentration to reach 500 thousand per millimeter, we can solve the equation $10^x = 500$. The graphical solution in Figure 5.50 is about 2.7, but finding this value symbolically requires *logarithms*.

Table 5.18

x	0	1	2	3
$B(x)$	1	10	100	1000

Figure 5.49

Figure 5.50 $B^{-1}(500) \approx 2.7$

The Common Logarithmic Function

Notice that $B(x) = 10^x$ in Figure 5.49 is increasing and one-to-one. Its graph passes the horizontal line test. Therefore B has an inverse function. Because $B(1) = 10$, it follows that $B^{-1}(10) = 1$. Similarly, $B(2) = 100$ implies that $B^{-1}(100) = 2$, and in general, $B(k) = 10^k$ implies that $B^{-1}(10^k) = k$. Table 5.19 lists values for $B^{-1}(x)$. Notice that, unlike B , B^{-1} increases *very slowly* for large values of x .

The solution to $10^x = 500$ represents the number of days needed for the bacteria concentration to reach 500 thousand per milliliter. To solve this equation, we must find an exponent k such that $10^k = 500$. Because $B^{-1}(10^k) = k$, this is equivalent to evaluating $B^{-1}(500)$. From Table 5.19, k is between 2 and 3 because $100 \leq 500 \leq 1000$. (This fact is also apparent from Figure 5.50.)

The inverse of $y = 10^x$ is defined to be the *common (base-10) logarithm*, denoted $\log x$ or $\log_{10} x$. Thus $10^2 = 100$ implies $\log 100 = 2$, $10^3 = 1000$ implies $\log 1000 = 3$, and in general, $10^a = b$ implies $\log b = a$. Thus $B^{-1}(500) = \log 500$.

Table 5.19

x	1	10	100	1000
$B^{-1}(x)$	0	1	2	3

The common exponential function and the common logarithmic function, represented in Tables 5.20 and 5.21, are inverse functions. (In our example, $B^{-1}(x) = \log x$.)

Table 5.20 Common Exponential Function

x	-4	-3	-2	-1	0	0.5	1	2	π
10^x	10^{-4}	10^{-3}	10^{-2}	10^{-1}	10^0	$10^{0.5}$	10^1	10^2	10^π

Table 5.21 Common Logarithmic Function

x	10^{-4}	10^{-3}	10^{-2}	10^{-1}	10^0	$10^{0.5}$	10^1	10^2	10^π
$\log x$	-4	-3	-2	-1	0	0.5	1	2	π

If a positive number x can be written as 10^k , then $\log x = k$. A *logarithm* is an *exponent* k . This concept can be illustrated visually.

Figure 5.51 The Common Logarithmic Function

The Graph of the Common Logarithmic Function The points $(10^{-1}, -1)$, $(10^0, 0)$, $(10^{0.5}, 0.5)$, and $(10^1, 1)$ are located on the graph of $y = \log x$. They are plotted in Figure 5.51. Any *positive* real number x can be expressed as $x = 10^k$ for some real number k . In this case $\log x = \log 10^k = k$. The graph of $y = \log x$ is continuous, as shown in Figure 5.51. The y -axis is a vertical asymptote. The common logarithmic function is one-to-one and always increasing. Its domain is all positive real numbers, and its range is all real numbers.

We have shown *verbal*, *numerical*, *graphical*, and *symbolic* representations of the common logarithmic function. A formal definition of the common logarithm is now given.

Common Logarithm

The **common logarithm** of a positive number x , denoted $\log x$, is defined by

$$\log x = k \quad \text{if and only if} \quad x = 10^k,$$

where k is a real number. The function given by

$$f(x) = \log x$$

is called the **common logarithmic function**.

NOTE The common logarithmic function outputs an *exponent* k , which may be positive, negative, or zero. However, a valid input must be positive. Thus its range is $(-\infty, \infty)$ and its domain is $(0, \infty)$.

EXAMPLE 1 Evaluating common logarithms

Simplify each logarithm by hand.

- (a) $\log 1$ (b) $\log \frac{1}{1000}$ (c) $\log \sqrt{10}$ (d) $\log (-2)$

Algebra Review

To review properties of exponents, see Section 4.8 and Chapter R (page R-7).

$$\begin{array}{r} \log(12) \\ 1.079181246 \\ 10^{1.079181246} \\ 12 \end{array}$$

Figure 5.52

Figure 5.53

SOLUTION

- (a) Since $1 = 10^0$, $\log 1 = \log 10^0 = 0$.
- (b) $\log \frac{1}{1000} = \log 10^{-3} = -3$
- (c) $\log \sqrt{10} = \log (10^{1/2}) = \frac{1}{2}$
- (d) The domain of $f(x) = \log x$ is $(0, \infty)$, so $\log(-2)$ is undefined because the input is negative.

Now Try Exercise 3

Square Roots and Logarithms Much like the square root function, the common logarithmic function does not have an easy-to-evaluate formula. For example, $\sqrt{4} = 2$ and $\sqrt{100} = 10$ can be calculated mentally, but for $\sqrt{2}$ we usually rely on a calculator. Similarly, $\log 100 = 2$ can be found mentally since $100 = 10^2$, whereas $\log 12$ can be approximated using a calculator. See Figure 5.52. To check that $\log 12 \approx 1.079181246$, evaluate $10^{1.079181246} \approx 12$. Another similarity between the square root function and the common logarithmic function is that their domains do not include negative numbers. If outputs are restricted to real numbers, both $\sqrt{-3}$ and $\log(-3)$ are undefined expressions.

MAKING CONNECTIONS

Logarithms and Exponents A logarithm is an exponent. For example, $\log 1000$ represents the exponent k such that $10^k = 1000$. Thus $\log 1000 = 3$ because $10^3 = 1000$.

Graphs and Inverse Properties Because $f(x) = 10^x$ and $f^{-1}(x) = \log x$ represent inverse functions, it follows that their graphs are reflections across the line $y = x$, as shown in Figure 5.53. For inverse functions, $f^{-1}(f(x)) = x$ and $f(f^{-1}(x)) = x$, so the following inverse properties hold for all valid inputs x .

Inverse Properties of the Common Logarithm

The following inverse properties hold for the common logarithm.

$$\log 10^x = x \quad \text{for any real number } x \text{ and}$$

$$10^{\log x} = x \quad \text{for any positive number } x$$

A graphing calculator has been used to illustrate these properties in Figures 5.54 and 5.55. (If you have a calculator available, try some other examples.)

$$\begin{array}{r} \log(10^5) \\ \log(10^{1.6}) \\ \log(10^{(-2.5)}) \end{array} \begin{array}{r} 5 \\ 1.6 \\ -2.5 \end{array}$$

Figure 5.54

$$\begin{array}{r} 10^{\log(2)} \\ 10^{\log(3.7)} \\ 10^{\log(0.12)} \end{array} \begin{array}{r} 2 \\ 3.7 \\ .12 \end{array}$$

Figure 5.55

An Application The human ear is extremely sensitive; it can detect pressures on the eardrum that range from 10^{-16} w/cm² (watts per square centimeter) to 10^{-4} w/cm². Sound with an intensity of 10^{-4} w/cm² is painful to the human eardrum. Because of this wide range of intensities, scientists use logarithms to measure sound in decibels.

EXAMPLE 2 Applying common logarithms to sound

Sound levels in decibels (db) can be computed by $D(x) = 10 \log(10^{16}x)$, where x is the intensity of the sound in watts per square centimeter. (Source: R. Weidner and R. Sells, *Elementary Classical Physics*.)

- At what decibel level does the threshold for pain occur?
- Make a table of D for the intensities $x = 10^{-13}, 10^{-12}, 10^{-11}, \dots, 10^{-4}$.
- If x increases by a factor of 10, what is the corresponding increase in decibels?

SOLUTION

- The threshold for pain occurs when $x = 10^{-4}$.

$$\begin{aligned}
 D(10^{-4}) &= 10 \log(10^{16} \cdot 10^{-4}) && \text{Substitute } x = 10^{-4} \\
 &= 10 \log(10^{12}) && \text{Add exponents when multiplying like bases.} \\
 &= 10(12) && \text{Evaluate the logarithm.} \\
 &= 120 && \text{Multiply.}
 \end{aligned}$$

The human eardrum begins to hurt at 120 decibels.

- Other values for x in Table 5.22 are computed in a similar manner.

CLASS DISCUSSION

If the sound level increases by 60 db, by what factor does the intensity increase?

Table 5.22

x (w/cm ²)	10^{-13}	10^{-12}	10^{-11}	10^{-10}	10^{-9}	10^{-8}	10^{-7}	10^{-6}	10^{-5}	10^{-4}
$D(x)$ (db)	30	40	50	60	70	80	90	100	110	120

- From Table 5.22, a tenfold increase in x results in an increase of 10 decibels.

Now Try Exercise 117 ◀

Figure 5.56

Logarithms with Other Bases

It is possible to develop base- a logarithms with any positive base $a \neq 1$. For example, in computer science base-2 logarithms are frequently used. A numerical representation of the base-2 logarithmic function, denoted $f(x) = \log_2 x$, is shown in Table 5.23. If x can be expressed in the form $x = 2^k$ for some k , then $\log_2 x = k$. Thus $\log_2 x$ is an exponent. A graph of $y = \log_2 x$ is shown in Figure 5.56.

Table 5.23 Base-2 Logarithm

x	$2^{-3.1}$	2^{-2}	$2^{-0.5}$	2^0	$2^{0.5}$	2^2	$2^{3.1}$
$\log_2 x$	-3.1	-2	-0.5	0	0.5	2	3.1

In a similar manner, a numerical representation for the base- e logarithm is presented in Table 5.24. The base- e logarithm is referred to as the **natural logarithm** and denoted either $\log_e x$ or $\ln x$. Natural logarithms are used in mathematics, science, economics, and technology. A graph of $y = \ln x$ is shown in Figure 5.57.

Figure 5.57

Table 5.24 Natural Logarithm

x	$e^{3.1}$	e^{-2}	$e^{-0.5}$	e^0	$e^{0.5}$	e^2	$e^{3.1}$
$\ln x$	3.1	-2	-0.5	0	0.5	2	3.1

A base- a logarithm is now defined. Its domain is $(0, \infty)$ and its range is $(-\infty, \infty)$.

Logarithm

The logarithm with base a of a positive number x , denoted by $\log_a x$, is defined by

$$\log_a x = k \quad \text{if and only if} \quad x = a^k,$$

where $a > 0$, $a \neq 1$, and k is a real number. The function, given by

$$f(x) = \log_a x,$$

is called the **logarithmic function with base a** .

EXAMPLE 1 Finding the domain of a logarithmic function

State the domain of f .

(a) $f(x) = \log_2(x - 4)$ (b) $f(x) = \ln(10^x)$

SOLUTION

- (a) The input for a logarithmic function must be positive. Any element of the domain of f must satisfy $x - 4 > 0$, or equivalently, $x > 4$. Thus $D = (4, \infty)$.
 (b) The expression 10^x is positive for all real numbers x . (See Figure 5.53, where the red graph of $y = 10^x$ is above the x -axis for all values of x .) Thus $D = (-\infty, \infty)$, or all real numbers.

Now Try Exercises 13 and 17

CLASS DISCUSSION

Make a numerical representation for a base-4 logarithm. Evaluate $\log_4 16$.

Remember that a *logarithm is an exponent*. The expression $\log_a x$ is the exponent k such that $a^k = x$. Logarithms with base a also satisfy inverse properties.

Inverse Properties

The following inverse properties hold for logarithms with base a .

$$\log_a a^x = x \quad \text{for any real number } x \text{ and}$$

$$a^{\log_a x} = x \quad \text{for any positive number } x$$

EXAMPLE 4 Applying inverse properties

Use inverse properties to evaluate each expression.

(a) $\log_6 6^{-1.3}$ (b) $5^{\log_5(x+8)}$ (c) $\log_{1/2} \left(\frac{1}{2}\right)^{45}$

SOLUTION

(a) $\log_a a^x = x$, so $\log_6 6^{-1.3} = -1.3$.

(b) $a^{\log_a x} = x$, so $5^{\log_5(x+8)} = x + 8$, provided $x > -8$.

(c) $\log_a a^x = x$, so $\log_{1/2} \left(\frac{1}{2}\right)^{45} = 45$. Note that the base of a logarithmic function can be a positive fraction less than 1.

Now Try Exercises 21, 23, and 25

EXAMPLE 5 Evaluating logarithms

Evaluate each logarithm.

(a) $\log_2 8$ (b) $\log_5 \frac{1}{25}$ (c) $\log_7 49$ (d) $\ln e^{-7}$

SOLUTION

(a) To determine $\log_2 8$, express 8 as 2^k for some k . Since $8 = 2^3$, $\log_2 8 = \log_2 2^3 = 3$.

(b) $\log_5 \frac{1}{25} = \log_5 \frac{1}{5^2} = \log_5 5^{-2} = -2$

(c) $\log_7 49 = \log_7 7^2 = 2$

(d) $\ln e^{-7} = \log_e e^{-7} = -7$

Now Try Exercises 33, 37, 39, and 49 ◀

Figure 5.58

Figure 5.59

Graphs and Inverse Functions The inverse function of $f(x) = a^x$ is $f^{-1}(x) = \log_a x$. Therefore the graph of $y = \log_a x$ is a reflection of the graph of $y = a^x$ across the line $y = x$. Figure 5.58 shows graphs of $f(x) = 2^x$ and $f^{-1}(x) = \log_2 x$. The graph of f^{-1} is a reflection of f in the line $y = x$. The rapid growth in f is called *exponential growth*. On the other hand, the graph of f^{-1} begins to level off. This slower rate of growth is called *logarithmic growth*. Since the range of f is all positive numbers, the domain of f^{-1} is all positive numbers. Notice that when $0 < x < 1$, $f^{-1}(x) = \log_2 x$ outputs negative numbers, and when $x > 1$, $f^{-1}(x)$ outputs positive numbers.

The graphs of $g(x) = e^x$ and $g^{-1}(x) = \ln x$ are shown in Figure 5.59. Because $e \approx 2.7183 > 2$, the graph of g increases faster than the graph of $f(x) = 2^x$, and the graph of g^{-1} levels off faster than the graph of $f^{-1}(x) = \log_2 x$.

MAKING CONNECTIONS

Exponential and Logarithmic Functions The inverse of an exponential function is a logarithmic function, and the inverse of a logarithmic function is an exponential function. For example,

if $f(x) = 10^x$ then $f^{-1}(x) = \log x$,

if $g(x) = \ln x$ then $g^{-1}(x) = e^x$, and

if $h(x) = 2^x$ then $h^{-1}(x) = \log_2 x$.

Basic Equations

Base-10 Exponential Equations To solve the equation $10 + x = 100$, we subtract 10 from each side because addition and subtraction are inverse operations.

$$10 + x - 10 = 100 - 10$$

$$x = 90$$

To solve the equation $10x = 100$, we divide each side by 10 because multiplication and division are inverse operations.

$$\frac{10x}{10} = \frac{100}{10}$$

$$x = 10$$

Now suppose that we want to solve the exponential equation

$$10^x = 100.$$

What is new about this type of equation is that the variable x is an *exponent*. The inverse operation of 10^x is $\log x$. Rather than subtracting 10 from each side or dividing each side by 10, we take the base-10 logarithm of each side. Doing so results in

$$\log 10^x = \log 100.$$

Because $\log 10^x = x$ for all real numbers x , the equation becomes

$$x = \log 100, \text{ or equivalently, } x = 2.$$

These concepts are applied in the next example. Note that if $m = n$ (m and n positive), then $\log m = \log n$.

EXAMPLE 6 Solving equations of the form $10^x = k$

Solve each equation, if possible.

(a) $10^x = 0.001$ (b) $10^x = 55$ (c) $10^x = -1$

SOLUTION

(a) Take the common logarithm of each side of the equation $10^x = 0.001$. Then

$$\log 10^x = \log 0.001, \quad \text{or} \quad x = \log 10^{-3} = -3.$$

(b) In a similar manner, $10^x = 55$ is equivalent to $x = \log 55 \approx 1.7404$.

(c) The equation $10^x = -1$ has no real solutions, because -1 is not in the range of 10^x . Figure 5.60 shows that the graphs of $y_1 = 10^x$ and $y_2 = -1$ do not intersect. Note that $\log(-1)$ is undefined.

Figure 5.60

Now Try Exercise 53

EXAMPLE 7 Solving a base-10 exponential equation

Solve $4(10^{3x}) = 244$.

SOLUTION Begin by dividing each side by 4.

$$4(10^{3x}) = 244 \quad \text{Given equation}$$

$$10^{3x} = 61 \quad \text{Divide by 4.}$$

$$\log 10^{3x} = \log 61 \quad \text{Take the common logarithm.}$$

$$3x = \log 61 \quad \text{Inverse property: } \log 10^k = k$$

$$x = \frac{\log 61}{3} \quad \text{Divide by 3.}$$

$$x \approx 0.595 \quad \text{Approximate.}$$

Now Try Exercise 65

Converting $10^{3x} = 61$ to the equivalent equation $3x = \log 61$ is sometimes referred to as changing **exponential form** to **logarithmic form**. In Example 7, the common logarithm is taken of each side of the equation. We usually include this step to emphasize the fact that *inverse properties* are being used to solve these equations.

Common Logarithmic Equations A logarithmic equation contains logarithms. To solve logarithmic equations we *exponentiate* each side of the equation and then apply the inverse property $10^{\log x} = x$. Note that if $m = n$, then $10^m = 10^n$.

$$\begin{array}{ll} \log x = 2.5 & \text{Given logarithmic equation} \\ 10^{\log x} = 10^{2.5} & \text{Exponentiate each side; base 10.} \\ x = 10^{2.5} & \text{Inverse property: } 10^{\log k} = k \\ x \approx 316.23 & \text{Approximate.} \end{array}$$

Converting the equation $\log x = k$ to the equivalent equation $x = 10^k$ is called changing *logarithmic form* to *exponential form*.

EXAMPLE 3 Solving equations of the form $\log x = k$

Solve each equation.

(a) $\log x = 3$ (b) $\log x = -2$ (c) $\log x = 2.7$

SOLUTION

(a) $\log x = 3$ Given equation
 $10^{\log x} = 10^3$ Exponentiate each side; base 10.
 $x = 10^3$ Inverse property: $10^{\log k} = k$
 $x = 1000$ Simplify.

(b) Similarly, $\log x = -2$ is equivalent to $x = 10^{-2} = 0.01$.

(c) $\log x = 2.7$ is equivalent to $x = 10^{2.7} \approx 501.19$.

Now Try Exercise 77 ◀

EXAMPLE 4 Solving a common logarithmic equation

Solve $5 \log 2x = 16$.

SOLUTION Begin by dividing each side by 5.

$$\begin{array}{ll} 5 \log 2x = 16 & \text{Given equation} \\ \log 2x = 3.2 & \text{Divide each side by 5.} \\ 10^{\log 2x} = 10^{3.2} & \text{Exponentiate each side; base 10.} \\ 2x = 10^{3.2} & \text{Inverse property: } 10^{\log k} = k \\ x = \frac{10^{3.2}}{2} & \text{Divide each side by 2.} \\ x \approx 792.45 & \text{Approximate.} \end{array}$$

Now Try Exercise 87 ◀

Modeling with Logarithms Some types of data grow slowly and can be modeled by $f(x) = a + b \log x$. For example, a larger area of land tends to have a wider variety of

birds. However, if the land area doubles, the number of species of birds does not double; the land area has to more than double before the number of species doubles.

EXAMPLE 10 Modeling data with logarithms

Table 5.25 lists the number of species of tropical birds on islands of different sizes near New Guinea.

- Find values for a and b so that $f(x) = a + b \log x$ models the data.
- Determine symbolically and graphically the size of an island that might have 50 different species of birds.

Table 5.25

Area (mi ²)	0.1	1	10	100	1000
Species of birds	26	39	52	65	78

Source: B. Freedman, *Environmental Ecology*.

SOLUTION

- Getting Started** When modeling data by hand with $f(x) = a + b \log x$, one strategy is to let a equal $f(1)$. (Note that $\log 1 = 0$.) Then substitute a data point into this formula and find b . This technique is illustrated below. ▶

Begin by substituting $x = 1$ into the formula to determine a .

$$\begin{aligned} a + b \log 1 &= 39 & f(1) &= 39 \\ a + b(0) &= 39 & \log 1 &= \log 10^0 = 0 \\ a &= 39 & \text{Simplify.} \end{aligned}$$

Thus $f(x) = 39 + b \log x$. Although we can use any data point in Table 5.25 to find b , we let $x = 10$.

$$\begin{aligned} 39 + b \log 10 &= 52 & f(10) &= 52 \\ b \log 10 &= 13 & \text{Subtract 39.} \\ b &= 13 & \log 10 &= 1 \end{aligned}$$

The data are modeled by $f(x) = 39 + 13 \log x$, a result verified in Figure 5.61.

- Symbolic Solution** We must solve the equation $f(x) = 50$.

$$\begin{aligned} 39 + 13 \log x &= 50 & f(x) &= 50 \\ 13 \log x &= 11 & \text{Subtract 39.} \\ \log x &= \frac{11}{13} & \text{Divide by 13.} \\ 10^{\log x} &= 10^{11/13} & \text{Exponentiate each side; base 10.} \\ x &= 10^{11/13} & \text{Inverse property: } 10^{\log k} &= k \\ x &\approx 7 & \text{Approximate.} \end{aligned}$$

To have 50 species of birds, an island should be about 7 square miles.

Graphical Solution The graphs of $Y_1 = 39 + 13 \log(X)$ and $Y_2 = 50$ in Figure 5.62 intersect near the point $(7.02, 50)$. This result agrees with our symbolic solution.

Now Try Exercise 119 ◀

X	Y1
.1	26
1	39
10	52
100	65
1000	78

$Y_1 = 39 + 13 \log(X)$

Figure 5.61

Figure 5.62

General Equations

Base- a Exponential Equations The exponential function $f(x) = a^x$ is one-to-one and therefore has an inverse function $f^{-1}(x) = \log_a x$. Because $f^{-1}(f(x)) = x$ for all real numbers x , or equivalently $\log_a a^x = x$, it follows that to solve an exponential equation we can take the base- a logarithm of each side. Note that if $m = n$ (m and n positive), then $\log_a m = \log_a n$.

EXAMPLE 11 Solving exponential equations

Solve each equation.

(a) $3^x = \frac{1}{27}$ (b) $e^x = 5$ (c) $3(2^x) - 7 = 20$

SOLUTION

(a) $\log_3 3^x = \log_3 \frac{1}{27}$ Take the base-3 logarithm of each side.
 $\log_3 3^x = \log_3 3^{-3}$ Properties of exponents
 $x = -3$ Inverse property: $\log_a a^k = k$

(b) Take the natural logarithm of each side. Then

$\ln e^x = \ln 5$ is equivalent to $x = \ln 5 \approx 1.609$.

Many calculators are able to compute natural logarithms. The evaluation of $\ln 5$ is shown in Figure 5.63. Notice that $e^{1.609437912} \approx 5$.

(c) $3(2^x) - 7 = 20$ Given equation
 $3(2^x) = 27$ Add 7 to each side.
 $2^x = 9$ Divide each side by 3.
 $\log_2 2^x = \log_2 9$ Take the base-2 logarithm of each side.
 $x = \log_2 9$ Inverse property: $\log_a a^k = k$

Now Try Exercises 55 and 67 ◀

Figure 5.63

$[-5, 5, 1]$ by $[-10, 30, 10]$

Figure 5.64

Introduction to the Change of Base Formula Figure 5.64 gives a graphical solution of about 3.17 for Example 11(c). The exact solution of $\log_2 9$ can be approximated by using the following **change of base formula**. (Its derivation is given in Section 5.5.)

$$\log_a x = \frac{\log_b x}{\log_b a}$$

Because calculators typically have only $\log x$ and $\ln x$ keys, this formula is often written as

$$\log_a x = \frac{\log x}{\log a} \quad \text{or} \quad \log_a x = \frac{\ln x}{\ln a}$$

For example, $\log_2 9 = \frac{\log 9}{\log 2} \approx 3.17$, which agrees with the graphical solution.

Base- a Logarithmic Equations To solve the equation $\log_a x = k$, we exponentiate each side of the equation by using base a . That is, we use the inverse property: $a^{\log_a x} = x$ for all positive x . This is illustrated in the next example. Note that if $m = n$, then $a^m = a^n$.

EXAMPLE 12 Solving logarithmic equations

Solve each equation.

(a) $\log_2 x = 5$ (b) $\log_5 x = -2$ (c) $\ln x = 4.3$ (d) $3 \log_2 5x = 9$

SOLUTION

(a) $\log_2 x = 5$ Given equation

$2^{\log_2 x} = 2^5$ Exponentiate each side; base 2.

$x = 2^5$ Inverse property: $a^{\log_a k} = k$

$x = 32$ Simplify.

(b) Similarly, $\log_5 x = -2$ is equivalent to $x = 5^{-2} = \frac{1}{25}$.

(c) $\ln x = 4.3$ is equivalent to $x = e^{4.3} \approx 73.7$.

(d) $3 \log_2 5x = 9$ Given equation

$\log_2 5x = 3$ Divide each side by 3.

$2^{\log_2 5x} = 2^3$ Exponentiate each side; base 2.

$5x = 8$ Inverse property: $a^{\log_a k} = k$

$x = \frac{8}{5}$ Divide each side by 5.

Now Try Exercises 79 and 83 ◀

Exponential and Logarithmic Forms We can solve $3^x = 7$ by taking the base-3 logarithm of each side.

$3^x = 7$ Given equation

$\log_3 3^x = \log_3 7$ Take the base-3 logarithm of each side.

$x = \log_3 7$ Inverse property: $\log_a a^k = k$

As they become more proficient, many people skip the second step. Converting $3^x = 7$ to $x = \log_3 7$ is called *changing exponential form to logarithmic form*. In a similar manner, we can solve $\log_3 x = 7$ by exponentiating each side base-3.

$\log_3 x = 7$ Given equation

$3^{\log_3 x} = 3^7$ Exponentiate each side; base-3.

$x = 3^7$ Inverse property: $a^{\log_a k} = k$

Converting $\log_3 x = 7$ to $x = 3^7$ is called *changing logarithmic form to exponential form*. Again, as they become more proficient, many people skip the second step by applying the definition of a logarithm for $a > 0$, $x > 0$, and $a \neq 1$:

$\log_a x = k$ is equivalent to $x = a^k$.

EXAMPLE 13 Converting exponential and logarithmic forms

Complete each of the following.

(a) Change $5^{3x} = 8$ to logarithmic form.

(b) Change $\log_4(4 - x) = 3$ to exponential form.

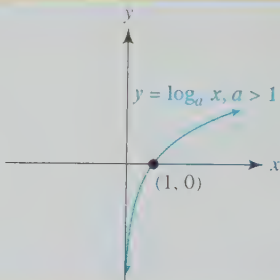

SOLUTION

(a) $5^{3x} = 8$ is equivalent to $3x = \log_5 8$.

(b) $\log_4(4 - x) = 3$ is equivalent to $4 - x = 4^3$. Now Try Exercises 113 and 115 ◀

5.4 Putting It All Together

The following table summarizes some important concepts about base- a logarithms. Common and natural logarithms satisfy the same properties.

Concept	Explanation	Examples
Base- a logarithm $a > 0, a \neq 1$	The base- a logarithm of a positive number x is $\log_a x = k$ if and only if $x = a^k$. That is, a logarithm is an exponent k .	$\log 100 = \log 10^2 = 2$ $\log_2 8 = \log_2 2^3 = 3$ $\log_3 \sqrt[3]{3} = \log_3 3^{1/3} = \frac{1}{3}$ $\ln 5 \approx 1.609$ (using a calculator)
Graph of $y = \log_a x$	The graph of the base- a logarithmic function <i>always</i> passes through the point $(1, 0)$ because $\log_a 1 = \log_a a^0 = 0$. The y -axis is a vertical asymptote. The graph passes the horizontal line test, so $f(x) = \log_a x$ is one-to-one and has an inverse given by $f^{-1}(x) = a^x$.	
Inverse properties	a^x and $\log_a x$ represent inverse operations. That is, $\log_a a^x = x$ and $a^{\log_a x} = x$ for $x > 0$.	$\log 10^{-3} = -3$ $\log_4 4^6 = 6$ $10^{\log x} = x, x > 0$ $4^{\log_4 2x} = 2x, x > 0$ $e^{\ln 5} = 5$
Inverse functions	The inverse function of $f(x) = a^x$ is $f^{-1}(x) = \log_a x$.	$f(x) = 10^x \iff f^{-1}(x) = \log x$ $g(x) = e^x \iff g^{-1}(x) = \ln x$ $h(x) = \log_2 x \iff h^{-1}(x) = 2^x$
Exponential equations	To solve $a^x = k$, take the base- a logarithm of each side.	$10^x = 15$ $\log 10^x = \log 15$ $x = \log 15$ $e^x = 20$ $\ln e^x = \ln 20$ $x = \ln 20$
Logarithmic equations	To solve $\log_a x = k$, exponentiate each side; use base a .	$\log x = 3$ $10^{\log x} = 10^3$ $x = 1000$ $\ln x = 5$ $e^{\ln x} = e^5$ $x = e^5$
Exponential and logarithmic forms	$\log_a x = k$ is equivalent to $x = a^k$.	$\log_5 25 = 2$ is equivalent to $25 = 5^2$. $4^3 = 64$ is equivalent to $\log_4 64 = 3$.

Graphs of Logarithmic Functions

Exercises 101–104: Use the graph of f to sketch a graph of f^{-1} . Give a symbolic representation of f^{-1} .

101.

102.

103.

104.

Exercises 105–108: Graph f and state its domain.

105. $f(x) = \log(x + 1)$ 106. $f(x) = \log(x - 3)$

107. $f(x) = \ln(-x)$ 108. $f(x) = \ln(x^2 + 1)$

Exercises 109 and 110: Graph $y = f(x)$. Is f increasing or decreasing on its domain?

109. $f(x) = \log_{1/2} x$ 110. $f(x) = \log_{1/3} x$

Exercises 111 and 112: Complete the following.

(a) Graph $y = f(x)$, $y = f^{-1}(x)$, and $y = x$.

(b) Determine the intervals where f and f^{-1} are increasing or decreasing.

111. $f(x) = \log_3 x$ 112. $f(x) = \log_{1/2} x$

Exponential and Logarithmic Forms

Exercises 113 and 114: Change each equation to its equivalent logarithmic form.

113. (a) $7^{4x} = 4$ (b) $e^x = 7$ (c) $c^x = b$

114. (a) $5^{2x} = 9$ (b) $b^x = a$ (c) $d^{2x} = b$

Exercises 115 and 116: Change each equation to its equivalent exponential form.

115. (a) $\log_8 x = 3$ (b) $\log_9(2 + x) = 5$ (c) $\log_a b = c$

116. (a) $\log x = 4$ (b) $\ln 8x = 7$ (c) $\log_a x = b$

Applications

117. **Decibels** (Refer to Example 2.) Use the formula $D(x) = 10 \log(10^{16}x)$ to determine the decibels when the intensity of a sound is $x = 10^{-11/2}$ watt per square centimeter.

118. **Decibels** (Refer to Example 2.) If the decibels of a sound increased by 15, by what factor did the intensity of the sound increase?

119. **Diversity of Birds** (Refer to Example 10.) The table lists the number of species of birds on islands of various sizes. Find values for a and b so that $f(x) = a + b \log x$ models these data. Estimate the size of an island that might have 16 species of birds.

Area (km ²)	0.1	1	10	100	1000
Species of birds	3	7	11	15	19

120. **Diversity of Insects** The table lists the number of types of insects found in wooded regions with various acreages. Find values for a and b so that $f(x) = a + b \log x$ models these data. Then use f to estimate an acreage that might have 1200 types of insects.

Area (acres)	10	100	1000	10,000	100,000
Insect Types	500	800	1100	1400	1700

121. **Growth of Bacteria** The table lists the number of bacteria y in millions after an elapsed time of x days.

x	0	1	2	3	4
y	3	6	12	24	48

(a) Find values for C and a so that $f(x) = Ca^x$ models the data.

(b) Estimate when there were 16 million bacteria.

122. **Growth of an Investment** The growth of an investment is shown in the table.

x (years)	0	5	10	15	20
y (dollars)	100	300	900	2700	8100

(a) Find values for C and a so that $f(x) = Ca^x$ models the data.

(b) Estimate when the account contained \$2000.

123. **Runway Length** There is a relation between an airplane's weight x and the runway length L required for takeoff. For some airplanes the minimum runway length L in thousands of feet may be modeled by $L(x) = 3 \log x$, where x is measured in thousands of pounds. (Source: L. Haefner, *Introduction to Transportation Systems*.)

(a) Graph L for $0 < x \leq 50$. Interpret the graph.

(b) If the weight of an airplane increases tenfold from 10,000 to 100,000 pounds, does the length of the required runway also increase by a factor of 10? Explain.

(c) Generalize your answer from part (b).

124. **Runway Length** (Refer to Exercise 123.) Estimate the maximum weight of a plane that can take off from a runway that is 5 thousand feet long.

125. **Acid Rain** Air pollutants frequently cause acid rain. A measure of the acidity is pH, which ranges between 1 and 14. Pure water is neutral and has a pH of 7. Acidic solutions have a pH less than 7, whereas alkaline solutions have a pH greater than 7. A pH value can be computed by $\text{pH} = -\log x$, where x represents the hydrogen ion concentration in moles per liter. In rural areas of Europe, rainwater typically has $x = 10^{-4.7}$. (Source: G. Howells, *Acid Rain and Acid Water*.)

- (a) Find its pH.
(b) Seawater has a pH of 8.2. How many times greater is the hydrogen ion concentration in rainwater from rural Europe than in seawater?

126. **Acid Rain** (Refer to Exercise 125.) Find the hydrogen ion concentration for the following pH levels of acid rain. (Source: G. Howells.)

- (a) 4.92 (pH of rain at Amsterdam Islands)
(b) 3.9 (pH of some rain in the eastern United States)

127. **Earthquakes** The Richter scale is used to measure the intensity of earthquakes, where intensity corresponds to the amount of energy released by an earthquake. If an earthquake has an intensity of x , then its *magnitude*, as computed by the Richter scale, is given by the formula $R(x) = \log \frac{x}{I_0}$, where I_0 is the intensity of a small measurable earthquake.

- (a) On July 26, 1963, an earthquake in Yugoslavia had a magnitude of 6.0 on the Richter scale, and on August 19, 1977, an earthquake in Indonesia measured 8.0. Find the intensity x for each of these earthquakes if $I_0 = 1$.

- (b) How many times more intense was the Indonesian earthquake than the Yugoslavian earthquake?

128. **Earthquakes** (Refer to Exercise 127.) If the intensity x of an earthquake increases by a factor of 10^3 , by how much does the Richter number R increase? Generalize your results.

129. **Hurricanes** Hurricanes are some of the largest storms on earth. They are very low pressure areas with diameters of over 500 miles. The barometric air pressure in inches of mercury at a distance of x miles from the eye of a severe hurricane is modeled by the formula $f(x) = 0.48 \ln(x + 1) + 27$. (Source: A. Miller and R. Anthes, *Meteorology*.)

- (a) Evaluate $f(0)$ and $f(100)$. Interpret the results.

-  (b) Graph f in $[0, 250, 50]$ by $[25, 30, 1]$. Describe how air pressure changes as one moves away from the eye of the hurricane.

- (c) At what distance from the eye of the hurricane is the air pressure 28 inches of mercury?

130. **Predicting Wind Speed** Wind speed typically varies in the first 20 meters above the ground. Close to the ground, wind speed is often less than it is at 20 meters above the ground. For this reason, the National Weather Service usually measures wind speeds at heights between 5 and 10 meters. For a particular day, let the formula $f(x) = 1.2 \ln x + 2.3$ compute the wind speed in meters per second at a height x meters above the ground for $x \geq 1$. (Source: A. Miller.)

- (a) Find the wind speed at a height of 5 meters.

-  (b) Graph f in the window $[0, 20, 5]$ by $[0, 7, 1]$. Interpret the graph.

- (c) Estimate the height where the wind speed is 5 meters per second.

131. **Cooling an Object** A pot of boiling water with a temperature of 100°C is set in a room with a temperature of 20°C . The temperature T of the water after x hours is given by $T(x) = 20 + 80e^{-x}$.

- (a) Estimate the temperature of the water after 1 hour.

- (b) How long did it take the water to cool to 60°C ?

- 132. Warming an Object** A can of soda with a temperature of 5°C is set in a room with a temperature of 20°C . The temperature T of the soda after x minutes is given by $T(x) = 20 - 15(10)^{-0.05x}$.
- Estimate the temperature of the soda after 5 minutes.
 - After how many minutes was the temperature of the soda 15°C ?
- 133. Traffic Flow** (Refer to Example 10, Section 5.3.) Cars arrive randomly at an intersection with an average rate of 20 cars per hour. The likelihood, or probability, that no car enters the intersection within a period of x minutes can be estimated by $f(x) = e^{-x/3}$.
- What is the probability that no car enters the intersection during a 5-minute period?
 - Determine the value of x that gives a 30% chance that no car enters the intersection during an interval of x minutes.
- 134. Population Growth** The population of Tennessee in millions is given by $P(x) = 4.88e^{0.0133x}$, where $x = 0$ corresponds to 1990. (Source: Bureau of the Census.)
- Determine symbolically the year when the population of Tennessee was 5.4 million.
 -  Solve part (a) graphically.

Writing about Mathematics

- 135.** Describe the relationship among exponential functions and logarithmic functions. Explain why logarithms are needed to solve exponential equations.
- 136.** Give verbal, numerical, graphical, and symbolic representations of a base-5 logarithmic function.

EXTENDED AND DISCOVERY EXERCISES

- 1. Average Rate of Change of $\ln x$** Find the average rate of change of $f(x) = \ln x$ from x to $x + 0.001$ for each value of x . Round your answers to two decimal places.
- $x = 1$
 - $x = 2$
 - $x = 3$
 - $x = 4$

- 2. Average Rate of Change of $\ln x$** (Refer to Exercise 1.) Compare each average rate of change of $\ln x$ to x . What is the pattern? Make a generalization.
- 3. Modeling Algae Growth** When sewage was accidentally dumped into Lake Tahoe, the concentration of the algae *Selenastrum* increased from 1000 cells per milliliter to approximately 1,000,000 cells per milliliter within 6 days. Let f model the algae concentration after x days have elapsed. (Source: A. Payne, "Responses of the three test algae of the algal assay procedure: bottle test.")
- Compute the average rate of change in f from 0 to 6 days.
 - The *specific growth rate* r is defined by the formula $r = \frac{\log N_2 - \log N_1}{x_2 - x_1}$, where N_1 is the algae concentration at time x_1 and N_2 is the algae concentration at time x_2 . Compute r in this example.
 - Discuss why environmental scientists might use the specific growth rate r , rather than the average rate of change, to describe algae growth.
- 4. Greenhouse Effect** According to one model, the future increases in average global temperatures (due to carbon dioxide levels exceeding 280 parts per million) can be estimated using $T = 6.5 \ln (C/280)$, where C is the concentration of atmospheric carbon dioxide in parts per million (ppm) and T is in degrees Fahrenheit. Let future amounts of carbon dioxide be modeled by the formula $C(x) = 364(1.005)^x$, where $x = 0$ corresponds to the year 2000, $x = 100$ to 2100, and so on. (Source: W. Clime, *The Economics of Global Warming*.)
- Use composition of functions to write T as a function of x . Evaluate T when $x = 100$ and interpret the result.
 -  Graph $C(x)$ in $[0, 200, 50]$ by $[0, 1000, 100]$ and $T(x)$ in $[0, 200, 50]$ by $[0, 10, 1]$. Describe each graph.
 - How does an exponential growth in carbon dioxide concentrations affect the increase in global temperature?

CHECKING BASIC CONCEPTS FOR SECTIONS 5.3 AND 5.4

- 1.** If the principal is \$1200 and the interest rate is 9.5% compounded monthly, calculate the account balance after 4 years. Determine the balance if the interest is compounded continuously.
- 2.** Find values for C and a so that $f(x) = Ca^x$ models the data in the table.

x	0	1	2	3
y	4	2	1	0.5

3. Explain verbally what $\log_2 15$ represents. Is it equal to an integer? (Do not use a calculator.)
4. Evaluate each of the following logarithms by hand.
 - (a) $\log_6 36$ (b) $\log \sqrt{10} + \log 0.01$ (c) $\ln \frac{1}{e^2}$
5. Solve each equation.
 - (a) $e^x = 5$ (b) $10^x = 25$ (c) $\log x = 1.5$
6. Solve each equation.
 - (a) $2e^x + 1 = 25$ (b) $\log 2x = 2.3$
 - (c) $\log x^2 = 1$
7. **Population** In July 1994, the population of New York state in millions was modeled by $f(x) = 18.2e^{0.001x}$, and the population of Florida in millions was modeled by $g(x) = 14e^{0.0168x}$. In both formulas x is the year, where $x = 0$ corresponds to July 1994. (Source: Bureau of the Census.)
 - (a) Find the population of each state in July 1994.
 - (b) Assuming these trends continue, estimate the year when the population of Florida will equal the population of New York. What will their populations be at this time?
8. **Growth in Salary** Suppose that a person's salary is initially \$30,000 and is modeled by $f(x)$, where x represents the number of years of experience. Use $f(x)$ to approximate the years of experience when the salary first exceeds \$60,000.
 - (a) $f(x) = 30,000(1.1)^x$
 - (b) $f(x) = 30,000 \log(10 + x)$

Would most people prefer that their salaries increase exponentially or logarithmically?

5.5 Properties of Logarithms

- Apply basic properties of logarithms
- Expand and combine logarithmic expressions
- Use the change of base formula

Introduction

The discovery of logarithms by John Napier (1550–1617) played an important role in the history of science. Logarithms were instrumental in allowing Johannes Kepler (1571–1630) to calculate the positions of the planet Mars, which led to his discovery of the laws of planetary motion. Kepler's laws were used by Isaac Newton (1643–1727) to discover the universal laws of gravitation. Although calculators and computers have made tables of logarithms obsolete, applications involving logarithms still play an important role in modern-day computation. One reason is that logarithms possess several important properties. For example, the loudness of a sound can be measured in decibels by the formula $f(x) = 10 \log(10^{16}x)$, where x is the intensity of the sound in watts per square centimeter. In Example 4, we use properties of logarithms to simplify this formula.

Basic Properties of Logarithms

Logarithms possess several important properties. One property of logarithms states that the sum of the logarithms of two numbers equals the logarithm of their product. For example, we see in Figure 5.65 that

$$\log 5 + \log 2 = \log 10 \qquad 5 \cdot 2 = 10$$

and in Figure 5.66 that

$$\log 4 + \log 25 = \log 100 \qquad 4 \cdot 25 = 100$$

These calculations illustrate a basic property of logarithms: $\log_a m + \log_a n = \log_a(mn)$.

$\log(5) + \log(2)$	1
$\log(10)$	1

Figure 5.65

$\log(4) + \log(25)$	2
$\log(100)$	2

Figure 5.66

Four properties of logarithms are as follows.

Properties of Logarithms

For positive numbers m , n , and $a \neq 1$ and any real number r :

1. $\log_a 1 = 0$ and $\log_a a = 1$
2. $\log_a m + \log_a n = \log_a (mn)$
3. $\log_a m - \log_a n = \log_a \left(\frac{m}{n}\right)$
4. $\log_a (m^r) = r \log_a m$

The properties of logarithms are a direct result of the properties of exponents and the inverse property $\log_a a^k = k$, as shown below.

Property 1: This property is a direct result of the inverse property: $\log_a a^x = x$.

$$\log_a 1 = \log_a a^0 = 0 \quad \text{and} \quad \log_a a = \log_a a^1 = 1$$

Examples: $\log 1 = 0$ and $\ln e = 1$

Property 2: If m and n are positive numbers, then we can write $m = a^c$ and $n = a^d$ for some real numbers c and d .

$$\log_a m + \log_a n = \log_a a^c + \log_a a^d = c + d$$

$$\log_a (mn) = \log_a (a^c a^d) = \log_a (a^{c+d}) = c + d$$

Thus $\log_a m + \log_a n = \log_a (mn)$.

Example: Let $m = 100$ and $n = 1000$.

$$\log m + \log n = \log 100 + \log 1000 = \log 10^2 + \log 10^3 = 2 + 3 = 5$$

$$\log (mn) = \log (100 \cdot 1000) = \log 100,000 = \log 10^5 = 5$$

Property 3: Let $m = a^c$ and $n = a^d$ for some real numbers c and d .

$$\log_a m - \log_a n = \log_a a^c - \log_a a^d = c - d$$

$$\log_a \left(\frac{m}{n}\right) = \log_a \left(\frac{a^c}{a^d}\right) = \log_a (a^{c-d}) = c - d$$

Thus $\log_a m - \log_a n = \log_a \left(\frac{m}{n}\right)$.

Example: Let $m = 100$ and $n = 1000$.

$$\log m - \log n = \log 100 - \log 1000 = \log 10^2 - \log 10^3 = 2 - 3 = -1$$

$$\log \left(\frac{m}{n}\right) = \log \left(\frac{100}{1000}\right) = \log \left(\frac{1}{10}\right) = \log (10^{-1}) = -1$$

Algebra Review

To review properties of exponents, see Section 4.8 and Chapter R (page R-7).

Property 4: Let $m = a^c$ and r be any real number.

$$\begin{aligned}\log_a m^r &= \log_a (a^c)^r = \log_a (a^{cr}) = cr \\ r \log_a m &= r \log_a a^c = rc\end{aligned}$$

Thus $\log_a (m^r) = r \log_a m$.

Example: Let $m = 100$ and $r = 3$.

$$\begin{aligned}\log m^r &= \log 100^3 = \log 1,000,000 = \log 10^6 = 6 \\ r \log m &= 3 \log 100 = 3 \log 10^2 = 3 \cdot 2 = 6\end{aligned}$$

Caution: $\log_a (m + n) \neq \log_a m + \log_a n$; $\log_a (m - n) \neq \log_a m - \log_a n$

EXAMPLE 1

Recognizing properties of logarithms

Use a calculator to evaluate each pair of expressions. Then state which property of logarithms this calculation illustrates.

- (a) $\ln 5 + \ln 4$, $\ln 20$ (b) $\log 10 - \log 5$, $\log 2$ (c) $\log 5^2$, $2 \log 5$

SOLUTION

- (a) From Figure 5.67, we see that the two expressions are equal. These calculations illustrate Property 2 because $\ln 5 + \ln 4 = \ln (5 \cdot 4) = \ln 20$.
 (b) The two expressions are equal in Figure 5.68, and these calculations illustrate Property 3 because $\log 10 - \log 5 = \log \frac{10}{5} = \log 2$.
 (c) The two expressions are equal in Figure 5.69, and these calculations illustrate Property 4 because $\log 5^2 = 2 \log 5$.

Figure 5.67

Figure 5.68

Figure 5.69

Now Try Exercises 1, 3, and 5

Expanding and Combining Logarithmic Expressions

The next two examples demonstrate how properties of logarithms can be used to expand logarithmic expressions.

EXAMPLE 2

Expanding logarithmic expressions

Use properties of logarithms to expand each expression. Write your answers without exponents.

- (a) $\log xy$ (b) $\ln \frac{5}{z}$ (c) $\log_4 \frac{\sqrt[3]{x}}{\sqrt{k}}$

SOLUTION

- (a) By Property 2, $\log xy = \log x + \log y$.
 (b) By Property 3, $\ln \frac{5}{z} = \ln 5 - \ln z$.
 (c) Begin by using Property 3.

$$\begin{aligned}\log_4 \frac{\sqrt[3]{x}}{\sqrt{k}} &= \log_4 \sqrt[3]{x} - \log_4 \sqrt{k} && \text{Property 3} \\ &= \log_4 x^{1/3} - \log_4 k^{1/2} && \text{Properties of exponents} \\ &= \frac{1}{3} \log_4 x - \frac{1}{2} \log_4 k && \text{Property 4}\end{aligned}$$

Now Try Exercises 7, 11, and 21 ◀

EXAMPLE 3 Applying properties of logarithms

Expand each expression. Write your answers without exponents.

(a) $\log_2 2x^4$ (b) $\ln \frac{7x^3}{k^2}$ (c) $\log \frac{\sqrt{x+1}}{(x-2)^3}$

SOLUTION

$$\begin{aligned}\text{(a)} \quad \log_2 2x^4 &= \log_2 2 + \log_2 x^4 && \text{Property 2} \\ &= 1 + 4 \log_2 x && \text{Properties 1 and 4} \\ \text{(b)} \quad \ln \frac{7x^3}{k^2} &= \ln 7x^3 - \ln k^2 && \text{Property 3} \\ &= \ln 7 + \ln x^3 - \ln k^2 && \text{Property 2} \\ &= \ln 7 + 3 \ln x - 2 \ln k && \text{Property 4} \\ \text{(c)} \quad \log \frac{\sqrt{x+1}}{(x-2)^3} &= \log \sqrt{x+1} - \log (x-2)^3 && \text{Property 3} \\ &= \log (x+1)^{1/2} - \log (x-2)^3 && \text{Properties of exponents} \\ &= \frac{1}{2} \log (x+1) - 3 \log (x-2) && \text{Property 4}\end{aligned}$$

Now Try Exercises 9, 15, and 27 ◀

An Application Sometimes properties of logarithms are used in applications to simplify a formula. This is illustrated in the next example.

EXAMPLE 4 Analyzing sound with decibelsSound levels in decibels (db) can be computed by $D(x) = 10 \log (10^{16}x)$.

- (a) Use properties of logarithms to simplify the formula for D .
 (b) Ordinary conversation has an intensity of $x = 10^{-10}$ w/cm². Find the decibel level.

SOLUTION

- (a) To simplify the formula, use Property 2.

$$\begin{aligned}D(x) &= 10 \log (10^{16}x) \\ &= 10(\log 10^{16} + \log x) && \text{Property 2} \\ &= 10(16 + \log x) && \text{Evaluate the first logarithm.} \\ &= 160 + 10 \log x && \text{Distributive property}\end{aligned}$$

(b) $D(10^{-10}) = 160 + 10 \log (10^{-10}) = 160 + 10(-10) = 160 - 100 = 60$

Ordinary conversation occurs at about 60 decibels.

Now Try Exercise 83 ◀

The next two examples demonstrate how properties of logarithms can be used to combine logarithmic expressions.

EXAMPLE 5 Applying properties of logarithms

Write each expression as the logarithm of a single expression.

$$(a) \ln 2e + \ln \frac{1}{e} \quad (b) \log_2 27 + \log_2 x^3 \quad (c) \log x^3 - \log x^2$$

SOLUTION

$$(a) \text{ By Property 2, } \ln 2e + \ln \frac{1}{e} = \ln \left(2e \cdot \frac{1}{e} \right) = \ln 2.$$

$$(b) \text{ By Property 2, } \log_2 27 + \log_2 x^3 = \log_2 (27x^3).$$

$$(c) \text{ By Property 3, } \log x^3 - \log x^2 = \log \frac{x^3}{x^2} = \log x.$$

Now Try Exercises 41, 43, and 49 ◀

EXAMPLE 6 Combining terms in logarithmic expressions

Write each expression as the logarithm of a single expression.

$$(a) \log 5 + \log 15 - \log 3 \quad (b) 2 \ln x - \frac{1}{2} \ln y - 3 \ln z$$

$$(c) 5 \log_3 x + \log_3 2x - \log_3 y$$

SOLUTION

$$\begin{aligned} (a) \log 5 + \log 15 - \log 3 &= \log (5 \cdot 15) - \log 3 && \text{Property 2} \\ &= \log \left(\frac{5 \cdot 15}{3} \right) && \text{Property 3} \\ &= \log 25 && \text{Simplify.} \end{aligned}$$

$$\begin{aligned} (b) 2 \ln x - \frac{1}{2} \ln y - 3 \ln z &= \ln x^2 - \ln y^{1/2} - \ln z^3 && \text{Property 4} \\ &= \ln \left(\frac{x^2}{y^{1/2}} \right) - \ln z^3 && \text{Property 3} \\ &= \ln \frac{x^2}{y^{1/2} z^3} && \text{Property 3} \\ &= \ln \frac{x^2}{z^3 \sqrt{y}} && \text{Properties of exponents} \end{aligned}$$

$$\begin{aligned} (c) 5 \log_3 x + \log_3 2x - \log_3 y &= \log_3 x^5 + \log_3 2x - \log_3 y && \text{Property 4} \\ &= \log_3 (x^5 \cdot 2x) - \log_3 y && \text{Property 2} \\ &= \log_3 \frac{2x^6}{y} && \text{Property 3} \end{aligned}$$

Now Try Exercises 39, 47, and 51 ◀

Algebra Review

To review rational exponents and radical notation, see Chapter R (page R-41).

Change of Base Formula

Occasionally it is necessary to evaluate a logarithm with a base other than 10 or e . This computation can be accomplished by using a change of base formula.

Change of Base Formula

Let x , $a \neq 1$, and $b \neq 1$ be positive real numbers. Then

$$\log_a x = \frac{\log_b x}{\log_b a}$$

The change of base formula can be derived as follows.

$$\begin{aligned} y &= \log_a x \\ a^y &= a^{\log_a x} && \text{Exponentiate each side; base } a. \\ a^y &= x && \text{Inverse property} \\ \log_b a^y &= \log_b x && \text{Take base-}b \text{ logarithm of each side.} \\ y \log_b a &= \log_b x && \text{Property 4} \\ y &= \frac{\log_b x}{\log_b a} && \text{Divide by } \log_b a. \\ \log_a x &= \frac{\log_b x}{\log_b a} && \text{Substitute } \log_a x \text{ for } y. \text{ (First equation)} \end{aligned}$$

To calculate $\log_2 5$, evaluate $\frac{\log 5}{\log 2} \approx 2.322$. The change of base formula was used with $x = 5$, $a = 2$, and $b = 10$. We could also have evaluated $\frac{\ln 5}{\ln 2} \approx 2.322$.

EXAMPLE 7 Applying the change of base formula

Use a calculator to approximate each expression to the nearest thousandth.

- (a) $\log_4 20$ (b) $\log_2 125 + \log_7 39$

SOLUTION

- (a) Using the change of base formula, we have $\log_4 20 = \frac{\log 20}{\log 4} \approx 2.161$. We could also evaluate $\frac{\ln 20}{\ln 4}$ to obtain the same result, as shown in Figure 5.70.
- (b) $\log_2 125 + \log_7 39 = \frac{\log 125}{\log 2} + \frac{\log 39}{\log 7} \approx 8.848$. See Figure 5.71.

$$\begin{aligned} \log(20)/\log(4) & \\ 2.160964047 & \\ \ln(20)/\ln(4) & \\ 2.160964047 & \end{aligned}$$

Figure 5.70

$$\begin{aligned} \log(125)/\log(2) + & \\ \log(39)/\log(7) & \\ 8.848482542 & \end{aligned}$$

Figure 5.71

Now Try Exercises 67 and 71

$[-10, 10, 1]$ by $[-10, 10, 1]$

Figure 5.72

The change of base formula can be used to graph base- a logarithmic functions.

EXAMPLE 8 Using the change of base formula

Solve the equation $\log_2(x^3 + x - 1) = 5$ graphically.

SOLUTION Graph $Y_1 = \log(X^3 + X - 1)/\log(2)$ and $Y_2 = 5$. See Figure 5.72. Their graphs intersect near the point $(3.104, 5)$. The solution is given by $x \approx 3.104$.

Now Try Exercise 77

5.5 Putting It All Together

The following table summarizes some properties of logarithms.

Concept	Explanation	Examples
Properties of logarithms	1. $\log_a 1 = 0$ and $\log_a a = 1$ 2. $\log_a m + \log_a n = \log_a (mn)$ 3. $\log_a m - \log_a n = \log_a \left(\frac{m}{n}\right)$ 4. $\log_a (m^r) = r \log_a m$	1. $\ln 1 = 0$ and $\log_2 2 = 1$ 2. $\log 3 + \log 6 = \log (3 \cdot 6) = \log 18$ 3. $\log_3 8 - \log_3 2 = \log_3 \frac{8}{2} = \log_3 4$ 4. $\log 6^7 = 7 \log 6$
Change of base formula	Let x , $a \neq 1$, and $b \neq 1$ be positive real numbers. Then $\log_a x = \frac{\log_b x}{\log_b a}$	$\log_3 6 = \frac{\log 6}{\log 3} = \frac{\ln 6}{\ln 3} \approx 1.631$
Graphing logarithmic functions	Use the change of base formula to graph $y = \log_a x$ whenever $a \neq 10$ and $a \neq e$.	To graph $y = \log_2 x$, let $Y_1 = \log (X)/\log (2)$ or $Y_1 = \ln (X)/\ln (2)$.

5.5 Exercises

Note: When applying properties of logarithms, assume that all variables are positive.

Properties of Logarithms

Exercises 1–6: (Refer to Example 1.) Use a calculator to approximate each pair of expressions. Then state which property of logarithms this calculation illustrates.

- $\log 4 + \log 7$, $\log 28$
- $\ln 12 + \ln 5$, $\ln 60$
- $\ln 72 - \ln 8$, $\ln 9$
- $3 \log 4$, $\log 4^3$
- $10 \log 2$, $\log 1024$
- $\log_2 100 - \log_2 20$, $\log_2 5$

Exercises 7–32: (Refer to Examples 2 and 3.) Expand the expression. If possible, write your answer without exponents.

- $\log_2 ab$
- $\ln 3x$
- $\ln 7a^4$
- $\log \frac{a^3}{3}$
- $\log \frac{6}{z}$
- $\ln \frac{xy}{z}$
- $\log \frac{x^2}{3}$
- $\log 3x^6$

15. $\ln \frac{2x^7}{3k}$

16. $\ln \frac{kx^3}{5}$

17. $\log_2 4k^2x^3$

18. $\log \frac{5kx^2}{11}$

19. $\log_5 \frac{25x^3}{y^4}$

20. $\log_2 \frac{32}{xy^2}$

21. $\ln \frac{x^4}{y^2\sqrt{z^3}}$

22. $\ln \frac{x\sqrt[3]{y^2}}{z^6}$

23. $\log_4 (0.25(x+2)^3)$

24. $\log (0.001(a-b)^{-3})$

25. $\log_5 \frac{x^3}{(x-4)^4}$

26. $\log_8 \frac{(3x-2)^2}{x^2+1}$

27. $\log_2 \frac{\sqrt{x}}{z^2}$

28. $\log \sqrt{\frac{xy^2}{z}}$

29. $\ln \sqrt[3]{\frac{2x+6}{(x+1)^5}}$

30. $\log \frac{\sqrt{x^2+4}}{\sqrt[3]{x-1}}$

31. $\log_2 \frac{\sqrt[3]{x^2-1}}{\sqrt{1+x^2}}$

32. $\log_8 \sqrt[3]{\frac{x+y^2}{2z+1}}$

Exercises 33–56: (Refer to Examples 5 and 6.) Write the expression as a logarithm of a single expression.

33. $\log 2 + \log 3$

34. $\log \sqrt{2} + \log \sqrt[3]{2}$

35. $\ln \sqrt{5} - \ln 25$

36. $\ln 33 - \ln 11$

37. $\log 20 + \log \frac{1}{10}$

38. $\log_2 24 + \log_2 \frac{1}{48}$

39. $\log 4 + \log 3 - \log 2$

40. $\log_3 5 - \log_3 10 - \log_3 \frac{1}{2}$

41. $\log_7 5 + \log_7 k^2$

42. $\log_6 45 + \log_6 b^3$

43. $\ln x^6 - \ln x^3$

44. $\log 10x^5 - \log 5x$

45. $\log \sqrt{x} + \log x^2 - \log x$

46. $\log \sqrt[4]{x} + \log x^4 - \log x^2$

47. $3 \ln x - \frac{3}{2} \ln y + 4 \ln z$

48. $\frac{2}{3} \ln y - 4 \ln x - \frac{1}{2} \ln z$

49. $\ln \frac{1}{e^2} + \ln 2e$

50. $\ln 4e^3 - \ln 2e^2$

51. $2 \ln x - 4 \ln y + \frac{1}{2} \ln z$

52. $\frac{1}{3} \log_5 (x+1) + \frac{1}{3} \log_5 (x-1)$

53. $\log 4 - \log x + 7 \log \sqrt{x}$

54. $\ln 3e - \ln \frac{1}{4e}$

55. $2 \log (x^2 - 1) + 4 \log (x - 2) - \frac{1}{2} \log y$

56. $\log_3 x + \log_3 \sqrt{x+3} - \frac{1}{3} \log_3 (x-4)$

Exercises 57–62: Complete the following.

(a) Use a table of $f(x)$ and $g(x)$ to determine whether $f(x) = g(x)$.

(b) If possible, use properties of logarithms to show that $f(x) = g(x)$.

57. $f(x) = \log 3x + \log 2x, \quad g(x) = \log 6x^2$

58. $f(x) = \ln 3x - \ln 2x, \quad g(x) = \ln x$

59. $f(x) = \ln 2x^2 - \ln x, \quad g(x) = \ln 2x$

60. $f(x) = \log x^2 + \log x^3, \quad g(x) = 5 \log x$

61. $f(x) = \ln x^4 - \ln x^2, \quad g(x) = 2 \ln x$

62. $f(x) = (\ln x)^2, \quad g(x) = 2 \ln x$

Exercises 63–66: Sketch a graph of f .

63. $f(x) = \log_2 x$

64. $f(x) = \log_2 x^2$

65. $f(x) = \log_3 |x|$

66. $f(x) = \log_4 2x$

Change of Base Formula

Exercises 67–76: Use the change of base formula to approximate the logarithm to the nearest thousandth.

67. $\log_2 25$

68. $\log_3 67$

69. $\log_5 130$

70. $\log_6 0.77$

71. $\log_2 5 + \log_2 7$

72. $\log_9 85 + \log_7 17$

73. $\sqrt{\log_4 46}$

74. $2 \log_5 15 + \sqrt[3]{\log_3 67}$

75. $\frac{\log_2 12}{\log_2 3}$

76. $\frac{\log_7 125}{\log_7 25}$

 **Exercises 77–80:** Solve the equation graphically. Express any solutions to the nearest thousandth.

77. $\log_2(x^3 + x^2 + 1) = 7$

78. $\log_3(1 + x^2 + 2x^4) = 4$

79. $\log_2(x^2 + 1) = 5 - \log_3(x^4 + 1)$

80. $\ln(x^2 + 2) = \log_2(10 - x^2)$

Applications

81. **Runway Length** (Refer to Exercise 123, Section 5.4.) Use a natural logarithm (instead of a common logarithm) to write the formula $L(x) = 3 \log x$. Evaluate $L(50)$ for each formula. Do your answers agree?

82. **Allometry** The equation $y = bx^a$ is used in applications involving biology and allometry. Another form of this equation is $\log y = \log b + a \log x$. Use properties of logarithms to obtain this second equation from the first. (Source: H. Lancaster, *Quantitative Methods in Biological and Medical Sciences*.)

83. **Decibels** (Refer to Example 4.) If the intensity x of a sound increases by a factor of 10, by how much does the decibel level increase?

84. **Decibels** (Refer to Example 4.) Use a natural logarithm to write the formula $f(x) = 160 + 10 \log x$. Evaluate $f(5 \times 10^{-8})$ for each formula. Do your answers agree?

85. **Light Absorption** When sunlight passes through lake water, its initial intensity I_0 decreases to a weaker intensity I at a depth of x feet according to the formula

$$\ln I - \ln I_0 = -kx,$$

where k is a positive constant. Solve this equation for I .

86. **Dissolving Salt** If C grams of salt are added to a sample of water, the amount A of undissolved salt is modeled by $A = Ca^x$, where x is time. Solve the equation for x .

87. **Population Growth** The population P (in millions) of California x years after 2000 can be modeled by $P = 34e^{0.013x}$.

(a) Use properties of logarithms to solve this equation for x .

(b) Use your equation to find x when $P = 38$. Interpret your answer.

88. **Population Growth** The population P (in millions) of Georgia x years after 2000 can be modeled by $P = 8e^{0.023x}$.

(a) Use properties of logarithms to solve this equation for x .

(b) Use your equation to find x when $P = 10$. Interpret your answer.

89. Solve $A = Pe^{rt}$ for t .

90. Solve $P = P_0e^{r(t-t_0)} + 5$ for t .

91. Write the sum

$$\log 1 + 2 \log 2 + 3 \log 3 + 4 \log 4 + 5 \log 5$$

as a logarithm of a single expression.

92. Show that

$$\log_2(x + \sqrt{x^2 - 4}) + \log_2(x - \sqrt{x^2 - 4}) = 2$$

is an identity. What is the domain of the expression on the left side of the equation?

Writing about Mathematics

93. A student insists that $\log(x + y)$ and $\log x + \log y$ are equal. How could you convince the student otherwise?

94. A student insists that $\log\left(\frac{x}{y}\right)$ and $\frac{\log x}{\log y}$ are equal. How could you convince the student otherwise?

5.6 Exponential and Logarithmic Equations

- Solve exponential equations
- Solve logarithmic equations

Introduction

The population of the world has grown rapidly during the past century. As a result, heavy demands have been made on the world's resources. Exponential functions and equations are often used to model this rapid growth, whereas logarithms are used to model slower growth.

Exponential Equations

The population P of the world was 3 billion in 1960, was 6.7 billion in 2008, and can be modeled by $P(x) = 3(1.017)^{x-1960}$, where x is the year. We can use P to estimate the year when world population reached 5 billion by solving the *exponential equation*

$$3(1.017)^{x-1960} = 5.$$

An equation in which one or more variables occur in the exponent of an expression is called an **exponential equation**. In the next example, we use Property 4 of logarithms, given by $\log_a(m^r) = r \log_a m$, to solve this equation.

EXAMPLE 1 Modeling world population

World population in billions during year x can be modeled by $P(x) = 3(1.017)^{x-1960}$, shown in Figure 5.73. Solve the equation $3(1.017)^{x-1960} = 5$ symbolically to estimate the year when world population reached 5 billion.

SOLUTION First divide each side by 3, and then take the common logarithm of each side. (The natural logarithm could also be used.)

$$3(1.017)^{x-1960} = 5$$

Given equation

$$(1.017)^{x-1960} = \frac{5}{3}$$

Divide by 3.

$$\log(1.017)^{x-1960} = \log \frac{5}{3}$$

Take the common logarithm.

$$(x - 1960) \log(1.017) = \log \frac{5}{3}$$

Property 4: $\log(m^r) = r \log m$

$$x - 1960 = \frac{\log(5/3)}{\log(1.017)}$$

Divide by $\log(1.017)$

$$x = 1960 + \frac{\log(5/3)}{\log(1.017)}$$

Add 1960.

$$x \approx 1990.3$$

Approximate.

This model predicts that world population reached 5 billion during 1990.

Now Try Exercise 71

Figure 5.73

CLASS DISCUSSION

What is the growth factor for $P(x) = 3(1.017)^{x-1960}$? By what percentage has world population grown, on average, each year from 1960 to 2008?

Exponential equations occur in a variety of applications and can be solved symbolically, graphically, and numerically. In the next example, these techniques are used to solve an exponential equation that describes the minimum thickness of the pavement for an airport runway.

EXAMPLE 3 Calculating the thickness of a runway

Heavier aircraft require runways with thicker pavement for landings and takeoffs. The relation between the thickness of the pavement t in inches and gross weight W in thousands of pounds can be approximated by

$$W(t) = 18.29e^{0.246t}$$

- (a) Determine the required thickness of the runway for a 130,000-pound plane.
 (b) Solve part (a) graphically and numerically.

Calculator Help

To find a point of intersection, see Appendix A (page AP-8).

SOLUTION

- (a) **Symbolic Solution** Because the unit for W is thousands of pounds, we solve the equation $W(t) = 130$.

$$18.29e^{0.246t} = 130$$

$$W(t) = 130$$

$$e^{0.246t} = \frac{130}{18.29}$$

Divide by 18.29

$$\ln e^{0.246t} = \ln \frac{130}{18.29}$$

Take the natural logarithm of each side

$$0.246t = \ln \frac{130}{18.29}$$

Inverse property: $\ln e$

$$t = \frac{\ln(130/18.29)}{0.246}$$

Divide by 0.246

$$t \approx 7.97$$

Approximate

The runway should be about 8 inches thick.

- (b) **Graphical Solution** Let $Y_1 = 18.29e^{(.246X)}$ and $Y_2 = 130$. In Figure 5.74, their graphs intersect near $(7.97, 130)$.

Numerical Solution Numerical support of this result is shown in Figure 5.75, where $y_1 \approx y_2$ when $x = 8$.

Now Try Exercise 73

$[0, 10, 1]$ by $[0, 200, 50]$

Figure 5.74

X	Y ₁	Y ₂
5	62.574	130
6	80.026	130
7	102.35	130
8	130.89	130
9	167.39	130
10	214.08	130
11	273.79	130

X = 8

Figure 5.75

**EXAMPLE 4** Modeling the decline of bluefin tuna

Bluefin tuna are large fish that can weigh 1500 pounds and swim at speeds of 55 miles per hour. Because they are used for sushi, a prime fish was worth over \$50,000 in 2008. As a result, the western Atlantic bluefin tuna have been exploited, and their numbers have declined exponentially. Their numbers in thousands from 1974 to 1991 can be modeled by the formula $f(x) = 230(0.881)^x$, where x is years after 1974. (In more recent years, environmental controls have helped slow this exponential decline.) (Source: B. Freedman, *Environmental Ecology*.)

- (a) Estimate the number of bluefin tuna in 1974 and 1991.
 (b) Determine symbolically the year when they numbered 50 thousand.

SOLUTION

- (a) To determine their numbers in 1974 and 1991, evaluate $f(0)$ and $f(17)$.

$$f(0) = 230(0.881)^0 = 230(1) = 230$$

$$f(17) = 230(0.881)^{17} \approx 26.7$$

Bluefin tuna decreased from 230 thousand in 1974 to fewer than 27 thousand in 1991.

- (b) Solve the equation $f(x) = 50$.

$$230(0.881)^x = 50$$

$$f(x) = 50$$

$$0.881^x = \frac{5}{23}$$

Divide by 230; simplify.

$$\ln 0.881^x = \ln \frac{5}{23}$$

Take the natural logarithm of each side. (The common logarithm could also be used.)

$$x \ln 0.881 = \ln \frac{5}{23}$$

Property 4: $\ln m^r = r \ln m$

$$x = \frac{\ln(5/23)}{\ln 0.881}$$

Divide by $\ln 0.881$.

$$x \approx 12.04$$

Approximate.

They numbered about 50 thousand in $1974 + 12.04 \approx 1986$. **Now Try Exercise 77** ◀

In real applications, a modeling function is seldom provided with the data. However, it is not uncommon to be given the general form of a function that describes a data set.

EXAMPLE 4 Finding a modeling function

The gap between organs available for transplant and people who need them has widened. In 1999 about 60,000 people were waiting for organ transplants, and in 2007 this number had increased to 100,000. This trend can be modeled by $T(x) = Ca^{x-1999}$, where C and a are constants. (Source: Scientific Registry of Transplant Recipients.)

- (a) Approximate C and a if the unit for T is thousands of people.
 (b) Use $T(x)$ to estimate the number of people who were waiting for organ transplants in 2004. Compare the estimate to the actual value of 86,000.

SOLUTION

- (a) In 1999 there were 60,000 people waiting, so $T(1999) = 60$. This equation can be used to find C .

$$T(1999) = Ca^{1999-1999} = Ca^0 = C(1) = 60$$

Thus $C = 60$ and $T(x) = 60a^{x-1999}$. In 2007 the number waiting was 100,000, so we can solve the equation $T(2007) = 100$ to find the value of a .

$$60a^{2007-1999} = 100$$

$$T(2007) = 100$$

$$a^8 = \frac{5}{3}$$

Divide by 60; simplify.

$$a = \sqrt[8]{\frac{5}{3}}$$

Take the eighth root of each side.

$$a \approx 1.066$$

Approximate.

Thus T is given by $T(x) = 60(1.066)^{x-1999}$.

- (b) For 2004 this model estimates that

$$T(2004) = 60(1.066)^{2004-1999} \approx 82.6$$

thousand people were waiting for an organ transplant, which is about 3400 less than the actual value.

Now Try Exercise 79 ◀

Exponential equations can occur in many forms. Although some types of exponential equations cannot be solved symbolically, Example 5 shows four equations that can.

EXAMPLE 5 Solving exponential equations symbolically

Solve each equation.

(a) $10^{x+2} = 10^{3x}$ (b) $5(1.2)^x + 1 = 26$ (c) $\left(\frac{1}{4}\right)^{x-1} = \frac{1}{9}$ (d) $5^{x-3} = e^{2x}$

SOLUTION

- (a) Start by taking the common logarithm of each side.

$$10^{x+2} = 10^{3x}$$

Given equation

$$\log 10^{x+2} = \log 10^{3x}$$

Take the common logarithm.

$$x + 2 = 3x$$

Inverse property: $\log 10^k = k$

$$2 = 2x$$

Subtract x .

$$x = 1$$

Divide by 2; rewrite.

- (b) **Getting Started** When solving an exponential equation, first isolate the exponential term on one side of the equation, if possible. Then take the logarithm of each side. ▶

$$5(1.2)^x = 25$$

Subtract 1.

$$(1.2)^x = 5$$

Divide by 5.

$$\log (1.2)^x = \log 5$$

Take the common logarithm.

$$x \log (1.2) = \log 5$$

Property 4: $\log m^r = r \log m$

$$x = \frac{\log 5}{\log (1.2)}$$

Divide by $\log (1.2)$.

$$x \approx 8.827$$

Approximate.

- (c) Begin by taking the common logarithm of each side.

$$\left(\frac{1}{4}\right)^{x-1} = \frac{1}{9}$$

Given equation

$$\log \left(\frac{1}{4}\right)^{x-1} = \log \frac{1}{9}$$

Take the common logarithm.

$$(x-1) \log \left(\frac{1}{4}\right) = \log \frac{1}{9}$$

Property 4: $\log m^r = r \log m$

$$x-1 = \frac{\log (1/9)}{\log (1/4)}$$

Divide by $\log \frac{1}{4}$.

$$x = 1 + \frac{\log (1/9)}{\log (1/4)} \approx 2.585$$

Add 1 and approximate.

This equation could also be solved by taking the natural logarithm of each side.

MAKING CONNECTIONS

Equations and One-to-One Functions If a function f is one-to-one, then $f(b) = f(a)$ implies that $a = b$. Because $f(x) = 10^x$ is a one-to-one function, it follows that $10^{x+2} = 10^{3x}$ implies that $x + 2 = 3x$. This step is equivalent to taking the common logarithm of each side of the given equation.

(d) Begin by taking the natural (or common) logarithm of each side.

$$\begin{array}{ll}
 5^{x-3} = e^{2x} & \text{Given equation} \\
 \ln 5^{x-3} = \ln e^{2x} & \text{Take the natural logarithm.} \\
 (x-3) \ln 5 = 2x & \text{Property 4; inverse property} \\
 x \ln 5 - 3 \ln 5 = 2x & \text{Distributive property} \\
 x \ln 5 - 2x = 3 \ln 5 & \text{Subtract } 2x; \text{ add } 3 \ln 5. \\
 x(\ln 5 - 2) = 3 \ln 5 & \text{Factor out } x. \\
 x = \frac{3 \ln 5}{\ln 5 - 2} & \text{Divide by } \ln 5 - 2. \\
 x \approx -12.36 & \text{Approximate.}
 \end{array}$$

Now Try Exercises 13, 17, 23, and 25 ◀

If a hot object is put in a room with temperature T_0 , then according to **Newton's law of cooling**, the temperature of the object after time t is modeled by

$$T(t) = T_0 + Da^t,$$

where $0 < a < 1$ and D is the initial temperature *difference* between the object and the room. This phenomenon is discussed in the next example.

EXAMPLE 6 Modeling coffee cooling

A pot of coffee with a temperature of 100°C is set down in a room with a temperature of 20°C . The coffee cools to 60°C after 1 hour.

- Find values for T_0 , D , and a so that $T(t) = T_0 + Da^t$ models the data.
- Find the temperature of the coffee after half an hour.
- How long did it take for the coffee to reach 50°C ? Support your result graphically.

SOLUTION

- The room has temperature $T_0 = 20^\circ\text{C}$, and the initial temperature difference between the coffee and the room is $D = 100 - 20 = 80^\circ\text{C}$. It follows that $T(t) = 20 + 80a^t$. We can use the fact that the temperature of the coffee after 1 hour was 60°C to determine the value of a .

$$\begin{array}{ll}
 T(1) = 60 & \\
 20 + 80a^1 = 60 & \text{Let } t = 1 \text{ in } T(t) = 20 + 80a^t. \\
 80a = 40 & \text{Subtract } 20. \\
 a = \frac{1}{2} & \text{Divide by } 80.
 \end{array}$$

Thus $T(t) = 20 + 80\left(\frac{1}{2}\right)^t$.

- After half an hour, the temperature is

$$T\left(\frac{1}{2}\right) = 20 + 80\left(\frac{1}{2}\right)^{1/2} \approx 76.6^\circ\text{C}.$$

(c) **Symbolic Solution** To determine when the coffee reached 50°C , solve $T(t) = 50$.

$$20 + 80\left(\frac{1}{2}\right)^t = 50$$

$$T(t) = 50$$

$$80\left(\frac{1}{2}\right)^t = 30$$

Subtract 20.

$$\left(\frac{1}{2}\right)^t = \frac{3}{8}$$

Divide by 80; simplify

$$\log\left(\frac{1}{2}\right)^t = \log\frac{3}{8}$$

Take the common logarithm.

$$t \log\left(\frac{1}{2}\right) = \log\frac{3}{8}$$

Property 4

$$t = \frac{\log(3/8)}{\log(1/2)}$$

Divide by $\log \frac{1}{2}$.

$$t \approx 1.415$$

Approximate.

The temperature reaches 50°C after about 1.415 hours, or 1 hour and 25 minutes.

Graphical Solution The graphs of $Y_1 = 20 + 80(1/2)^X$ and $Y_2 = 50$ intersect near $(1.415, 50)$, as shown in Figure 5.76. This result agrees with the symbolic solution.

Now Try Exercise 83 ◀

$[0, 3, 1]$ by $[0, 100, 10]$

Figure 5.76

NOTE Newton's law of cooling can also model the temperature of a cold object that is brought into a warm room. In this case, the temperature difference D is negative.

Some exponential equations *cannot* be solved symbolically but can be solved graphically. This is demonstrated in the next example.

EXAMPLE 7 Solving an exponential equation graphically

Solve $e^{-x} + 2x = 3$ graphically. Approximate all solutions to the nearest hundredth.

SOLUTION The graphs of $Y_1 = e^{-X} + 2X$ and $Y_2 = 3$ intersect near the points $(-1.92, 3)$ and $(1.37, 3)$, as shown in Figures 5.77 and 5.78. Thus the solutions are approximately -1.92 and 1.37 .

$[-6, 6, 1]$ by $[-4, 4, 1]$

Figure 5.77

$[-6, 6, 1]$ by $[-4, 4, 1]$

Figure 5.78

Now Try Exercise 65 ◀

Logarithmic Equations

Logarithmic equations contain logarithms. Like exponential equations, logarithmic equations also occur in applications. To solve a logarithmic equation, we use the inverse property $a^{\log_a x} = x$. This technique is illustrated in the next example.

EXAMPLE 8 Solving a logarithmic equationSolve $3 \log_3 x = 12$.**SOLUTION** Begin by dividing each side by 3.

$$\log_3 x = 4 \quad \text{Divide by 3.}$$

$$3^{\log_3 x} = 3^4 \quad \text{Exponentiate each side; base 3.}$$

$$x = 81 \quad \text{Inverse property: } a^{\log_a k} = k \quad \text{Now Try Exercise 49} \quad \blacktriangleleft$$

EXAMPLE 9 Solving a logarithmic equation symbolically

In developing countries, there is a relationship between the amount of land a person owns and the average daily calories consumed. This relationship is modeled by the formula $C(x) = 280 \ln(x + 1) + 1925$, where x is the amount of land owned in acres and $0 \leq x \leq 4$. (Source: D. Grigg, *The World Food Problem*.)

- Find the average caloric intake for a person who owns no land.
- A graph of C is shown in Figure 5.79. Interpret the graph.
- Determine symbolically the number of acres owned by someone whose average intake is 2000 calories per day.

Figure 5.79

SOLUTION

- Since $C(0) = 280 \ln(0 + 1) + 1925 = 1925$, a person without land consumes an average of 1925 calories per day.
- As the amount of land x increases, the caloric intake y also increases. However, the rate of increase slows. This would be expected because there is a limit to the number of calories an average person would eat, regardless of his or her economic status.
- Solve the equation $C(x) = 2000$.

$$280 \ln(x + 1) + 1925 = 2000 \quad C(x) = 2000$$

$$280 \ln(x + 1) = 75 \quad \text{Subtract 1925.}$$

$$\ln(x + 1) = \frac{75}{280} \quad \text{Divide by 280.}$$

$$\ln(x + 1) = 75/280 \quad \text{Exponentiate each side; base } e.$$

$$x + 1 = e^{75/280} \quad \text{Inverse property: } e^{\ln k} = k$$

$$x = e^{75/280} - 1 \quad \text{Subtract 1.}$$

$$x \approx 0.307 \quad \text{Approximate.}$$

A person who owns about 0.3 acre has an average intake of 2000 calories per day.

Now Try Exercise 87 ◀

Like exponential equations, logarithmic equations can occur in many forms. The next example illustrates three equations that can be solved symbolically.

EXAMPLE 10 Solving logarithmic equations symbolically

Solve each equation.

$$(a) \log(2x + 1) = 2 \quad (b) \log_2 4x = 2 - \log_2 x$$

$$(c) 2 \ln(x + 1) = \ln(1 - 2x)$$

SOLUTION

(a) To solve the equation, exponentiate each side of the equation using base 10.

$$\begin{aligned}\log(2x + 1) &= 2 && \text{Given equation} \\ 10^{\log(2x+1)} &= 10^2 && \text{Exponentiate each side; base 10.} \\ 2x + 1 &= 100 && \text{Inverse property: } 10^{\log k} = k \\ x &= 49.5 && \text{Solve for } x.\end{aligned}$$

(b) To solve this equation, apply properties of logarithms.

$$\begin{aligned}\log_2 4x &= 2 - \log_2 x && \text{Given equation} \\ \log_2 4x + \log_2 x &= 2 && \text{Add } \log_2 x. \\ \log_2 4x^2 &= 2 && \text{Property 2: } \log_a m + \log_a n = \log_a(mn) \\ 2^{\log_2 4x^2} &= 2^2 && \text{Exponentiate each side; base 2.} \\ 4x^2 &= 4 && \text{Inverse property: } a^{\log_a k} = k \\ x &= \pm 1 && \text{Solve for } x.\end{aligned}$$

However, -1 is not a solution since $\log_2 x$ is undefined for negative values of x . Thus the only solution is 1.

(c) Start by applying Property 4 to the given equation.

$$\begin{aligned}2 \ln(x + 1) &= \ln(1 - 2x) && \text{Given equation} \\ \ln(x + 1)^2 &= \ln(1 - 2x) && \text{Property 4} \\ e^{\ln(x+1)^2} &= e^{\ln(1-2x)} && \text{Exponentiate; base } e. \\ (x + 1)^2 &= 1 - 2x && \text{Inverse property: } a^{\log_a k} = k \\ x^2 + 2x + 1 &= 1 - 2x && \text{Expand the binomial.} \\ x^2 + 4x &= 0 && \text{Combine terms.} \\ x(x + 4) &= 0 && \text{Factor.} \\ x = 0 \text{ or } x = -4 &&& \text{Zero-product property}\end{aligned}$$

Substituting $x = 0$ and $x = -4$ in the given equation shows that 0 is a solution but -4 is not a solution.

Now Try Exercises 53, 57, and 61 ◀

EXAMPLE 11 Modeling the life span of a robin

In one study, the life spans of 129 robins were monitored over a 4-year period. The equation $y = \frac{2 - \log(100 - x)}{0.42}$ can be used to calculate the number of years y required for x percent of the robin population to die. For example, to find the time when 40% of the robins had died, substitute $x = 40$ into the equation. The result is $y \approx 0.53$, or about half a year. (Source: D. Lack, *The Life of a Robin*.)

- (a) Graph y in $[0, 100, 10]$ by $[0, 5, 1]$. Interpret the graph.
 (b) Estimate graphically the percentage of the robins that had died after 2 years.

SOLUTION

- (a) The graph of $Y_1 = (2 - \log(100 - X))/0.42$ is shown in Figure 5.80. At first, the graph increases slowly between 0% and 60%. Since years are listed on the y -axis and percentages on the x -axis, this slow increase in f indicates that not many years pass

Figure 5.80

[0, 100, 10] by [0, 5, 1]

Figure 5.81

before a large percentage of the robins die. When $x \geq 60$, the graph begins to increase dramatically. This indicates that a small percentage have a comparatively long life span.

- (b) To determine the percentage that had died after 2 years, graph y_1 and $y_2 = 2$. Their graphs intersect near $(85.5, 2)$, as shown in Figure 5.81. After 2 years, approximately 85.5% of the robins had died—a surprisingly high percentage. **Now Try Exercise 89** ◀

MAKING CONNECTIONS

Solving Exponential and Logarithmic Equations At some point in the process of solving an exponential equation, we often take a logarithm of each side of the equation. Similarly, when solving a logarithmic equation, we often exponentiate each side of the equation.

5.6 Putting It All Together

The following table summarizes techniques that can be used to solve some types of exponential and logarithmic equations symbolically.

Concept	Explanation	Example
Exponential equations	<p>Typical form: $Ca^x = k$</p> <p>Solve for a^x. Then take a base-a logarithm of each side.</p> <p>Use the inverse property:</p> $\log_a a^x = x.$	$4e^x = 24$ $e^x = 6$ $\ln e^x = \ln 6$ $x = \ln 6 \approx 1.79$
Logarithmic equations	<p><i>Equation 1:</i> $C \log_a x = k$</p> <p>Solve for $\log_a x$. Then exponentiate each side with base a.</p> <p>Use the inverse property:</p> $a^{\log_a x} = x.$ <p><i>Equation 2:</i> $\log_a bx \pm \log_a cx = k$</p> <p>When more than one logarithm with the same base occurs, use properties of logarithms to combine logarithms.</p> <p>Be sure to check any solutions.</p>	<p>1. $4 \log x = 10$</p> $\log x = 2.5$ $10^{\log x} = 10^{2.5}$ $x = 10^{2.5} \approx 316$ <p>2. $\log x + \log 4x = 2$</p> $\log 4x^2 = 2$ $4x^2 = 10^2$ $x^2 = 25$ $x = \pm 5$ <p>The only solution is 5.</p>

5.6 Exercises

Solving Exponential Equations

Exercises 1–4: The graphical and symbolic representations of f and g are shown.

(a) Use the graph to solve $f(x) = g(x)$.

(b) Solve $f(x) = g(x)$ symbolically.

Exercises 5–34: Solve the exponential equation.

5. $4e^x = 5$
6. $2e^{-x} = 8$
7. $2(10)^x + 5 = 45$
8. $100 - 5(10)^x = 7$
9. $2.5e^{-1.2x} = 1$
10. $9.5e^{0.005x} = 19$
11. $1.2(0.9)^x = 0.6$
12. $0.05(1.15)^x = 5$
13. $4(1.1)^{x-1} = 16$
14. $3(2)^{x-2} = 99$
15. $5(1.2)^{3x-2} + 94 = 100$
16. $1.4(2)^{x+3} = 2.8$
17. $5^{3x} = 5^{1-2x}$
18. $7^{x^2} = 7^{4x-3}$
19. $10^{(x^2)} = 10^{3x-2}$
20. $e^{2x} = e^{5x-3}$
21. $\left(\frac{1}{5}\right)^x = -5$
22. $2^x = -4$
23. $\left(\frac{2}{5}\right)^{x-2} = \frac{1}{3}$
24. $\left(\frac{3}{2}\right)^{x+1} = \frac{7}{3}$
25. $4^{x-1} = 3^{2x}$
26. $3^{1-2x} = e^{0.5x}$

27. $e^{x-3} = 2^{3x}$

28. $6^{x+1} = 4^{2x-1}$

29. $3(1.4)^x - 4 = 60$

30. $2(1.05)^x + 3 = 10$

31. $5(1.015)^{x-1980} = 8$

32. $30 - 3(0.75)^{x-1} = 29$

33. $4\left(\frac{3}{4}\right)^{x+1} = \frac{1}{81}\left(\frac{3}{2}\right)^{5+x}$

34. $5\left(\frac{2}{5}\right)^{x+1} = \frac{1}{125}\left(\frac{4}{5}\right)^{x-3}$

Solving Logarithmic Equations

Exercises 35–64: Solve the logarithmic equation.

35. $3 \log x = 2$
36. $5 \ln x = 10$
37. $\ln 2x = 5$
38. $\ln 4x = 1.5$
39. $\log 2x^2 = 2$
40. $\log(2 - x) = 0.5$
41. $\log_2(3x - 2) = 4$
42. $\log_3(1 - x) = 1$
43. $\log_5(8 - 3x) = 3$
44. $\log_6(2x + 4) = 2$
45. $160 + 10 \log x = 50$
46. $160 + 10 \log x = 120$
47. $\ln x + \ln x^2 = 3$
48. $\log x^5 = 4 + 3 \log x$
49. $2 \log_2 x = 4.2$
50. $3 \log_2 3x = 1$
51. $\log x + \log 2x = 2$
52. $\ln 2x + \ln 3x = \ln 6$
53. $\log(2 - 3x) = 3$
54. $\log(x^2 + 1) = 2$
55. $\ln x + \ln(3x - 1) = \ln 10$
56. $\log x + \log(2x + 5) = \log 7$
57. $2 \ln x = \ln(2x + 1)$
58. $\log(x^2 + 3) = 2 \log(x + 1)$
59. $\log(x + 1) + \log(x - 1) = \log 3$
60. $\ln(x^2 - 4) - \ln(x + 2) = \ln(3 - x)$
61. $\log_2 2x = 4 - \log_2(x + 2)$
62. $\log_3 x + \log_3(x + 2) = \log_3 24$
63. $\log_5(x + 1) + \log_5(x - 1) = \log_5 15$
64. $\log_7 4x - \log_7(x + 3) = \log_7 x$

Solving Equations Graphically

 **Exercises 65–70:** The following equations cannot be solved symbolically. Solve these equations graphically and round your answers to the nearest hundredth.

65. $2x + e^x = 2$ 66. $xe^x - 1 = 0$

67. $x^2 - x \ln x = 2$ 68. $x \ln |x| = -2$

69. $xe^{-x} + \ln x = 1$ 70. $2^{x-2} = \log x^4$

Applications

71. **Population Growth** World population P in billions during year x is modeled by $P(x) = 3(1.017)^{x-1960}$, where $1960 \leq x \leq 2010$. Estimate the year when world population reached 4 billion.

72. **Population of Arizona** The population P of Arizona has been increasing at an annual rate of 3.5%. In 1990 the population of Arizona was 3.7 million.

(a) Write a formula for $P(x)$, where x is the year and P is in millions.

(b) Estimate the population of Arizona in 2005.

73. **Light Absorption** When light passes through water, its intensity I decreases according to the formula $I(x) = I_0 e^{-kx}$, where I_0 is the initial intensity of the light and x is the depth in feet. If $I_0 = 1000$ lumens per square meter and $k = 0.12$, determine symbolically and graphically the depth at which the intensity is 25% of I_0 .

74. **Light Absorption** (Refer to Exercise 73.) Let $I(x) = 500e^{-0.2x}$ and determine symbolically and graphically the depth x at which the intensity I is 1% of $I_0 = 500$.

75. **Modeling Bacteria** (Refer to Section 5.3, Example 8.) The number N of *E. coli* bacteria in millions per milliliter after t minutes can be modeled by $N(t) = 0.5e^{0.014t}$.

Determine symbolically the elapsed time required for the concentration of bacteria to reach 25 million per milliliter.

76. **Credit Cards** From 1987 to 1996 the number of Visa cards and MasterCards was up 80% to 376 million. The formula $f(x) = 36.2e^{0.14x}$ models the amount of credit card spending from Thanksgiving to Christmas in billions of dollars, x years after 1987. (Source: National Credit Counseling Services.)

(a) Determine symbolically the year when this amount reached \$55 billion.

 (b) Solve part (a) graphically or numerically.

77. **Bluefin Tuna** The number of Atlantic bluefin tuna in thousands x years after 1974 can be modeled by $f(x) = 230(0.881)^x$. Estimate the year when the number of bluefin tuna reached 95 thousand.

78. **U.S. Liver Transplants** The number of individuals waiting for liver transplants can be modeled by $f(x) = 2340(1.124)^{x-1988}$, where x is the year. (Source: United Network for Organ Sharing.)

(a) Estimate this number in 2005.

(b) Determine symbolically when this number might reach 30,000.

79. **Population Growth** In 2000 the population of India reached 1 billion, and in 2025 it is projected to be 1.4 billion. (Source: Bureau of the Census.)

(a) Find values for C and a so that $P(x) = Ca^{x-2000}$ models the population of India in year x .

(b) Estimate India's population in 2010.

(c) Use P to determine the year when India's population might reach 1.5 billion.

80. **Population of Pakistan** In 2007 the population of Pakistan was 164 million, and it is expected to be 250 million in 2025. (Source: United Nations.)

(a) Approximate C and a so that $P(x) = Ca^{x-2007}$ models these data, where P is in millions and x is the year.

(b) Estimate the population of Pakistan in 2015, and compare your estimate to the predicted value of 204 million.

(c) Estimate when this population could reach 212 million.

81. **Organ Transplants** (Refer to Example 4.) Determine when the number of individuals waiting for organ transplants is expected to reach 140,000.

82. **Midair Near Collisions** The table shows the number of airliner near collisions y in year x .

x	1989	1991	1993	1995
y	131	78	44	34

Source: FAA.

- (a) Approximate constants C and a so that the formula $f(x) = Ca^{(x-1989)}$ models the data.

- (b) Support your answer by graphing f and the data.

83. **Newton's Law of Cooling** A pan of boiling water with a temperature of 212°F is set in a bin of ice with a temperature of 32°F . The pan cools to 70°F in 30 minutes.

- (a) Find T_0 , D , and a so that $T(t) = T_0 + Da^t$ models the data, where t is in hours.

- (b) Find the temperature of the pan after 10 minutes.

- (c) How long did it take the pan to reach 40°F ? Support your result graphically.

84. **Warming an Object** A pan of cold water with a temperature of 35°F is brought into a room with a temperature of 75°F . After 1 hour, the temperature of the pan of water is 45°F .

- (a) Find T_0 , D , and a so that $T(t) = T_0 + Da^t$ models the data, where t is in hours.

- (b) Find the temperature of the water after 3 hours.

- (c) How long would it take the water to reach 60°F ?

85. **Warming a Soda Can** Suppose that a can of soda, initially at 5°C , warms to 18°C after 2 hours in a room that has a temperature of 20°C .

- (a) Find the temperature of the soda can after 1.5 hours.

- (b) How long did it take for the soda to warm to 15°C ?

86. **Cooling a Soda Can** A soda can at 80°F is put into a cooler containing ice at 32°F . The temperature of the soda after t minutes is given by $T(t) = 32 + 48(0.9)^t$.

- (a) Evaluate $T(30)$ and interpret your results.

- (b) How long did it take for the soda to cool to 50°F ?

87. **Caloric Intake** (Refer to Example 9.) The formula

$$C(x) = 280 \ln(x + 1) + 1925$$

models the number of calories consumed daily by a person owning x acres of land in a developing country. Estimate the number of acres owned for which average intake is 2300 calories per day.

88. **Salinity** The salinity of the oceans changes with latitude and with depth. In the tropics, the salinity increases on the surface of the ocean due to rapid evaporation. In the higher latitudes, there is less evaporation and rainfall causes the salinity to be less on the surface than at lower depths. The function given by

$$S(x) = 31.5 + 1.1 \log(x + 1)$$

models salinity to depths of 1000 meters at a latitude of 57.5°N . The input x is the depth in meters and the output $S(x)$ is in grams of salt per kilogram of seawater. (Source: D. Hartman, *Global Physical Climatology*.)

- (a) Evaluate $S(500)$. Interpret your result.

- (b) Graph S . Discuss any trends.

- (c) Find the depth where the salinity equals 33.

89. **Life Span** Solve Example 11, part (b) symbolically.

90. **Life Span of Sparrows** (Refer to Example 11.) The life span of a sample of sparrows was studied. The equation $y = \frac{2 - \log(100 - x)}{0.37}$ calculates the number of years y required for x percent of the sparrows to die, where $0 \leq x \leq 95$.

- (a) Find y when $x = 40$. Interpret your answer.

- (b) Find x when $y = 1.5$. Interpret your answer.

91. **Bacteria Growth** The concentration of bacteria in a sample can be modeled by $B(t) = B_0 e^{kt}$, where t is in hours and B is the concentration in billions of bacteria per liter.

- (a) If the concentration increases by 15% in 6 hours, find k .

- (b) If $B_0 = 1.2$, find B after 8.2 hours.

- (c) By what percentage does the concentration increase each hour?

92. **Voltage** The voltage in a circuit can be modeled by $V(t) = V_0 e^{kt}$, where t is in milliseconds.

- (a) If the voltage decreases by 85% in 5 milliseconds, find k .

- (b) If $V_0 = 4.5$ volts, find V after 2.3 milliseconds.

- (c) By what percentage does the voltage decrease each millisecond?

Exercises 93 and 94: For the given annual interest rate r , estimate the time for P dollars to double.

93. $P = \$1000$, $r = 8.5\%$ compounded quarterly
 94. $P = \$750$, $r = 12\%$ compounded continuously

*Exercises 95 and 96: **Continuous Compounding** Suppose that P dollars is deposited in a savings account paying 9% interest compounded continuously. After t years, the account will contain $A(t) = Pe^{0.09t}$ dollars.*

- (a) Solve $A(t) = b$ for the given values of P and b .
 (b) Interpret your results.

95. $P = 500$ and $b = 750$
 96. $P = 1000$ and $b = 2000$

97. **Radioactive Carbon-14** The percentage P of radioactive carbon-14 remaining in a fossil after t years is given by $P = 100\left(\frac{1}{2}\right)^{t/5700}$. Suppose a fossil contains 35% of the carbon-14 that the organism contained when it was alive. Estimate the age of the fossil.

98. **Radioactive Radium-226** The amount A of radium in milligrams remaining in a sample after t years is given by $A(t) = 0.02\left(\frac{1}{2}\right)^{t/1600}$. How many years will it take for the radium to decay to 0.004 milligram?

99. **Traffic Flow** (Refer to Section 5.3, Example 10.) The probability that a car will enter an intersection within a period of x minutes is given by $P(x) = 1 - e^{-0.5x}$. Determine symbolically the elapsed time x when there is a 50–50 chance that a car has entered the intersection. (Hint: Solve $P(x) = 0.5$.)

100. **Modeling Traffic Flow** Cars arrive randomly at an intersection with an average traffic volume of 1 car per minute. The likelihood, or probability, that at least one car enters the intersection during a period of x minutes can be estimated by $f(x) = 1 - e^{-x}$.

- (a) What is the probability that at least one car enters the intersection during a 5-minute period?
 (b) Determine the value of x that gives a 40% chance that at least one car enters the intersection during an interval of x minutes.

101. **Modeling Bacteria Growth** Suppose that the concentration of a bacteria sample is 100,000 bacteria per milliliter. If the concentration doubles every 2 hours, how long will it take for the concentration to reach 350,000 bacteria per milliliter?

102. **Modeling Bacteria Growth** Suppose that the concentration of a bacteria sample is 50,000 bacteria per milliliter. If the concentration triples in 4 days, how long will it take for the concentration to reach 85,000 bacteria per milliliter?

103. **Continuous Compounding** Suppose that \$2000 is deposited in an account and the balance increases to \$2300 after 4 years. How long will it take for the account to grow to \$3200? Assume continuous compounding.

104. **Modeling Radioactive Decay** Suppose that a 0.05-gram sample of a radioactive substance decays to 0.04 gram in 20 days. How long will it take for the sample to decay to 0.025 gram?

105. **Drug Concentrations** The concentration of a drug in a patient's bloodstream after t hours is modeled by the formula $C(t) = 11(0.72)^t$, where C is measured in milligrams per liter.

- (a) What is the initial concentration of the drug?
 (b) How long does it take for the concentration to decrease to 50% of its initial level?

106. **Reducing Carbon Emissions** When fossil fuels are burned, carbon is released into the atmosphere. Governments could reduce carbon emissions by placing a tax on fossil fuels. The **cost-benefit** equation

$$\ln(1 - P) = -0.0034 - 0.0053x$$

estimates the relationship between a tax of x dollars per ton of carbon and the percent P reduction in emissions of carbon, where P is in decimal form. Determine P when $x = 60$. Interpret the result. (Source: W. Clime, *The Economics of Global Warming*.)

107. **Investments** The formula $A = P\left(1 + \frac{r}{n}\right)^{nt}$ can be used to calculate the future value of an investment. Solve the equation for t .

108. **Decibels** The formula $D = 160 + 10 \log x$ can be used to calculate loudness of a sound. Solve the equation for x .

Writing about Mathematics

109. Explain how to solve the equation $Ca^x = k$ symbolically for x . Demonstrate your method.
 110. Explain how to solve the equation $b \log_a x = k$ symbolically for x . Demonstrate your method.

EXTENDED AND DISCOVERY EXERCISE

1. **Exponential Functions** Show that any exponential function in the form $f(x) = Ca^x$ can be written as

$f(x) = Ce^{kx}$. That is, write k in terms of a . Use your method to write $g(x) = 2^x$ in the form e^{kx} for some k .

CHECKING BASIC CONCEPTS FOR SECTIONS 5.5 AND 5.6

- Use properties of logarithms to expand $\log \frac{x^2y^3}{\sqrt{z}}$. Write your answer without exponents.
- Write the expression $\frac{1}{2} \ln x - 3 \ln y + \ln z$ as a logarithm of a single expression.
- Solve each equation.
 - $5(1.4)^x - 4 = 25$
 - $4^{2-x} = 4^{2x+1}$
- Solve each equation.
 - $5 \log_2 2x = 25$
 - $\ln(x+1) + \ln(x-1) = \ln 3$
- The temperature T of a cooling object in degrees Fahrenheit after x minutes is given by

$$T = 80 + 120(0.9)^x.$$
 - What happens to T after a long time?
 - After how long is the object's temperature 100°F ?

5.7 Constructing Nonlinear Models

- Find an exponential model
- Find a logarithmic model
- Find a logistic model
- Select a model

Introduction

If data change at a constant rate, then they can be modeled with a linear function. However, real-life data often change at a nonconstant rate. For example, a tree grows slowly when it is small and then gradually grows faster as it becomes larger. Finally, when the tree is mature, its height begins to level off. This type of growth is nonlinear.

Three types of nonlinear data are shown in Figures 5.82–5.84, where t represents time. In Figure 5.82 the data increase rapidly, and an exponential function might be an appropriate modeling function. In Figure 5.83 the data are growing, but at a slower rate than in Figure 5.82. These data could be modeled by a logarithmic function. Finally, in Figure 5.84 the data increase slowly, then increase faster, and finally level off. These data might represent the height of a tree over a 50-year period. To model these data, we need a new type of function called a *logistic function*.

Figure 5.82 Exponential Data

Figure 5.83 Logarithmic Data

Figure 5.84 Logistic Data

Exponential Model

Both world population and bacteria growth can sometimes be modeled by an exponential function that *increases*. Exponential functions can also be used to model data that *decrease*. In the next example, an exponential function is used to model atmospheric pressure.

EXAMPLE 1 Modeling atmospheric pressure

As altitude increases, air pressure decreases. The atmospheric pressure P in millibars (mb) at a given altitude x in meters is listed in Table 5.26.

Table 5.26 Altitude and Air Pressure

x (m)	0	5000	10,000	15,000	20,000	25,000	30,000
P (mb)	1013	541	265	121	55	26	12

Source: A. Miller and J. Thompson, *Elements of Meteorology*.

- Make a scatterplot of the data. What type of function might model the data?
- Use regression to find an exponential function given by $f(x) = ab^x$. Graph the data and f in the same viewing rectangle.
- Use f to estimate the air pressure at an altitude of 23,000 feet.

SOLUTION

- The data are shown in Figure 5.85. A *decreasing* exponential function might model the data.

NOTE It is possible for a different function, such as a portion of a polynomial graph, to model the data. Answers may vary.

- Figures 5.86 and 5.87 show that values of $a \approx 1104.9$ and $b \approx 0.99985$ are obtained from exponential regression, where $f(x) = ab^x$. Figure 5.88 illustrates that f models the data quite accurately.
- $f(23,000) = 1104.9(0.99985)^{23,000} \approx 35.1$ millibars

Now Try Exercise 15

Logarithmic Model

An investor buying a certificate of deposit (CD) usually gets a higher interest rate if the money is deposited for a longer period of time. However, the interest rate for a 2-year CD is not usually twice the rate for a 1-year CD. Instead the rate of interest gradually increases with a longer-term CD. In the next example, we model interest rates with a logarithmic function.

EXAMPLE 1 Modeling interest rates

Table 5.27 lists the interest rates for certificates of deposit. Use the data to complete the following.

Table 5.27 Yield on Certificates of Deposit

Time	6 mo	1 yr	2.5 yr	5 yr
Yield	4.75%	5.03%	5.25%	5.54%

Source: USA Today.

- Make a scatterplot of the data. What type of function might model these data?
- Use least-squares regression to find a formula $f(x) = a + b \ln x$ that models the data.
- Graph f and the data in the same viewing rectangle.

SOLUTION

- Enter the data points (0.5, 4.75), (1, 5.03), (2.5, 5.25), and (5, 5.54) into your calculator. A scatterplot of the data is shown in Figure 5.89. The data increase but gradually level off. A logarithmic modeling function may be appropriate.
- In Figures 5.90 and 5.91 least-squares regression has been used to find a logarithmic function f given (approximately) by $f(x) = 5 + 0.33 \ln x$.
- A graph of f and the data are shown in Figure 5.92.

Figure 5.92

Now Try Exercise 13

Figure 5.93 Sigmoidal Curve

Logistic Model

In real life, populations of bacteria, insects, and animals do not continue to grow indefinitely. Initially, population growth may be slow. Then, as their numbers increase, so does the rate of growth. After a region has become heavily populated or saturated, the population usually levels off because of limited resources.

This type of growth may be modeled by a **logistic function** represented by $f(x) = \frac{c}{1 + ae^{-bx}}$, where a , b , and c are positive constants. A typical graph of a logistic function f is shown in Figure 5.93. The graph of f is referred to as a **sigmoidal curve**. The next example demonstrates how a logistic function can be used to describe the growth of a yeast culture.

EXAMPLE 2 Modeling logistic growth

One of the earliest studies about population growth was done using yeast plants in 1913. A small amount of yeast was placed in a container with a fixed amount of nourishment. The units of yeast were recorded every 2 hours. The data are listed in Table 5.28.

Table 5.28

Time	0	2	4	6	8	10	12	14	16	18
Yeast	9.6	29.0	71.1	174.6	350.7	513.3	594.8	640.8	655.9	661.8

Source: T. Carlson, *Biochem.*; D. Brown, *Models in Biology*.

- Make a scatterplot of the data in Table 5.28. Describe the growth.
- Use least-squares regression to find a logistic function f that models the data.
- Graph f and the data in the same viewing rectangle.
- Approximate graphically the time when the amount of yeast was 200 units.

SOLUTION

- A scatterplot of the data is shown in Figure 5.94. The yeast increase slowly at first. Then they grow more rapidly, until the amount of yeast gradually levels off. The limited amount of nourishment causes this leveling off.
- In Figure 5.95 and 5.96 we see least-squares regression being used to find a logistic function f given by

$$f(x) = \frac{661.8}{1 + 74.46e^{-0.552x}}.$$

- In Figure 5.97 the data and f are graphed in the same viewing rectangle. The fit for the *real* data is remarkably good.

Figure 5.98

- The graphs of $Y_1 = f(x)$ and $Y_2 = 200$ intersect near $(6.29, 200)$, as shown in Figure 5.98. The amount of yeast reached 200 units after about 6.29 hours.

Now Try Exercise 17 ◀

CLASS DISCUSSION

In Example 3, suppose that after 18 hours the experiment had been extended and more nourishment had been provided for the yeast plants. Sketch a possible graph of the amount of yeast.

MAKING CONNECTIONS

Logistic Functions and Horizontal Asymptotes If a logistic function is given by $f(x) = \frac{c}{1 + ae^{-bx}}$, where a , b , and c are positive constants, then the graph of f has a horizontal asymptote of $y = c$. (Try to explain why this is true.) In Example 3, the value of c was 661.8. This means that the amount of yeast leveled off at about 661.8 units.

Selecting a Model

In real-data applications, a modeling function is seldom given. Many times we must choose the type of modeling function and then find it using least-squares regression. Thus far in this section, we have used exponential, logarithmic, and logistic functions to model data. In the next two examples, we select a modeling function.

EXAMPLE 1 Modeling highway design

To allow enough distance for cars to pass on two-lane highways, engineers calculate minimum sight distances between curves and hills. See the figure. Table 5.29 shows the minimum sight distance y in feet for a car traveling at x miles per hour.

**Table 5.29**

x (mph)	20	30	40	50	60	65	70
y (ft)	810	1090	1480	1840	2140	2310	2490

Source: L. Haefner, *Introduction to Transportation Systems*.

- Find a modeling function for the data.
- Graph the data and your modeling function.
- Estimate the minimum sight distance for a car traveling at 43 miles per hour.

SOLUTION

Getting Started One strategy is to plot the data and then decide if the data are linear or nonlinear. If the data are approximately linear, use linear regression to find the modeling function. If the data are nonlinear, think about how the data increase or decrease. You may want to try several types of modeling functions, such as quadratic, cubic, power, exponential, or logarithmic, before making a final decision. ▶

- A scatterplot is shown in Figure 5.99. The data appear to be (nearly) linear, so linear regression has been used to obtain $f(x) = 33.93x + 113.4$. See Figure 5.100.
- The data and f are graphed in Figure 5.101. Function f gives a good fit.

[0, 80, 10] by [0, 3000, 1000]

**Figure 5.99**

LinReg
 $y = ax + b$
 $a = 33.92832765$
 $b = 113.4300341$
 $r^2 = .9986779453$
 $r = .999338754$

Figure 5.100

[0, 80, 10] by [0, 3000, 1000]

**Figure 5.101**

(c) $f(43) = 33.93(43) + 113.4 \approx 1572$ feet

Now Try Exercise 19 ◀

You may have seen asbestos being removed from buildings. Before 1960 people were generally unaware of its health hazards. As a result, insulation workers who worked with asbestos experienced higher rates of lung cancer. The following example models data from this era.

EXAMPLE 5 Modeling asbestos and cancer

Table 5.30 lists the number N of lung cancer cases occurring within a group of asbestos insulation workers with a cumulative total of 100,000 years of work experience, with their first date of employment x years ago.

Table 5.30

x (years)	10	15	20	25	30
N (cases)	6.9	25.4	63.6	130	233

Source: A. Walker, *Observation and Inference*.

- (a) Find a modeling function for the data.
- (b) Graph the data and your modeling function.
- (c) Estimate the number of lung cancer cases for $x = 23$ years.

SOLUTION

Getting Started The data are nonlinear and increasing, so there are a number of functions you can try. Three possibilities are quadratic, power, and exponential. ▶

- (a) A scatterplot is shown in Figure 5.102. To model the data we have used a power function given by $f(x) = 0.004334x^{3.2}$. See Figure 5.103. (Answers may vary.)
- (b) The data and f are graphed in Figure 5.104. Function f gives a good fit.

[0, 40, 10] by [-50, 250, 50]

Figure 5.102

PwrReg

Figure 5.104

$$(c) \quad f(23) = 0.004334(23)^{3.2} \approx 99 \text{ cases}$$

Now Try Exercise 21 ◀

5.7 Putting It All Together

The following table summarizes the basics of exponential, logarithmic, and logistic models. Least-squares regression can be used to determine the constants a , b , c , and C .

Concept	Explanation	Examples
Exponential model	$f(x) = Ca^x$, $f(x) = ab^x$, or $A(t) = A_0e^{kt}$	Exponential functions can be used to model data that increase or decrease rapidly over time.
Logarithmic model	$f(x) = a + b \log x$ or $f(x) = a + b \ln x$	Logarithmic functions can be used to model data that increase gradually over time.
Logistic model	$f(x) = \frac{c}{1 + ae^{-bx}}$	Logistic functions can be used to model data that at first increase slowly, then increase rapidly, and finally level off.

5.7

Exercises

Note: Because different functions can be used to model the same data, your answers may vary from the given answers. You can check the validity of your answer by graphing the data and your modeling function in the same viewing rectangle.

Selecting a Model

Exercises 1–4: Select an appropriate type of modeling function for the data shown in the graph. Choose from the following.

i. Exponential ii. Logarithmic iii. Logistic

Exercises 5–10: Make a scatterplot of the data. Then find an exponential, logarithmic, or logistic function f that best models the data.

5.

x	1	2	3	4
y	2.04	3.47	5.90	10.02

x	1	2	3	4	5
y	2.0	1.6	1.3	1.0	0.82

Applications

11. **Heart Disease Death Rates** The table contains heart disease death rates per 100,000 people for selected ages.

Age	30	40	50	60	70
Death rate	30.5	108.2	315	776	2010

Source: Department of Health and Human Services.

- (a) Make a scatterplot of the data in the viewing rectangle $[25, 75, 5]$ by $[-100, 2100, 200]$.
- (b) Find a function f that models the data.
- (c) Estimate the heart disease death rate for people who are 80 years old.

12. **Female Mechanics** The number of females working in automotive repair is increasing. The table shows the number of female ASE-certified technicians for selected years.

Year	1988	1989	1990	1991
Total	556	614	654	737

Year	1992	1993	1994	1995
Total	849	1086	1329	1592

Source: National Institute for Automotive Service Excellence.

- (a) What type of function might model these data?
- (b) Use least-squares regression to find an exponential function given by $f(x) = ab^x$ that models the data. Let $x = 0$ correspond to 1988.
- (c) Use f to estimate the number of certified female technicians in 2005. Round the result to the nearest hundred.
13. **Telecommuting** Some workers use technology such as e-mail, computers, and multiple phone lines to work at home, rather than in the office. However, because of the need for teamwork and collaboration in the workplace, fewer employees are telecommuting than expected. The table lists telecommuters T in millions during year x .

x	1997	1998	1999	2000	2001
T	9.2	9.6	10.0	10.4	10.6

T	11.0	11.1	11.2	11.3	11.4

Source: USA Today.

Find a function f that models the data, where $x = 1$ corresponds to 1997, $x = 2$ to 1998, and so on.

-  14. **Hurricanes** The table shows the air pressure y in inches of mercury x miles from the eye of a hurricane.

x	2	4	8	15	30	100
y	27.3	27.7	28.04	28.3	28.7	29.3

Source: A. Miller and R. Anthes, *Meteorology*.

- (a) Make a scatterplot of the data.
- (b) Find a function f that models the data.
- (c) Estimate the air pressure at 50 miles.

-  15. **Atmospheric Density** The table lists the atmospheric density y in kilograms per cubic meter (kg/m^3) at an altitude of x meters.

x (m)	0	5000	10,000	15,000
y (kg/m^3)	1.2250	0.7364	0.4140	0.1948

x (m)	20,000	25,000	30,000
y (kg/m^3)	0.0889	0.0401	0.0184

Source: A. Miller.

- (a) Find a function f that models the data.
- (b) Predict the density at 7000 meters. (The actual value is $0.59 \text{ kg}/\text{m}^3$.)
16. **Modeling Data** Use the table to complete the following.

x	1	2	5	10
y	2.5	2.1	1.6	1.2

- (a) Find a function f that models the data.
- (b) Solve the equation $f(x) = 1.8$.

-  17. **Insect Population** The table at the top of the next column shows the density y of a species of insect measured in thousands per acre after x days.

x	2	4	6	8	10	12	14
y	0.38	1.24	2.86	4.22	4.78	4.94	4.98

- (a) Find a function f that models the data.
- (b) Use f to estimate the insect density after a long time.

18. **Heart Disease** As age increases, so does the likelihood of coronary heart disease (CHD). The percentage P of people x years old with signs of CHD is shown in the table.

x	15	25	35	45	55	65	75
$P(\%)$	2	7	19	43	68	82	87

Source: D. Hosmer and S. Lemeshow, *Applied Logistics Regression*.

- (a) Evaluate $P(25)$ and interpret the answer.
- (b) Find a function that models the data.
- (c) Graph P and the data.
- (d) At what age does a person have a 50% chance of having signs of CHD?

19. **U.S. Radio Stations** The numbers N of radio stations on the air for selected years x are listed in the table.

x	1960	1970	1980	1990	2000
$N(x)$	4133	6760	8566	10,788	12,808

Source: M. Street Corporation.

- (a) Find a function that models the data.
- (b) Graph N and the data.
- (c) When did the number of radio stations on the air reach 9500?

20. **College Tuition and Fees** The table lists average public tuition and fees T in constant (2006) dollars during year x .

x	1980	1985	1990	1995	2000
$T(x)$	1707	2227	2620	3346	3662

Source: The College Board.

- (a) Find a function that models the data.
- (b) Graph T and the data.
- (c) When did tuition and fees first reach \$3000?

21. **Wing Size** Heavier birds tend to have larger wings than smaller birds. For one species of bird, the table lists the area A of the bird's wing in square inches if the bird weighs w pounds.

w (lb)	2	6	10	14	18
$A(w)$ (in ²)	160	330	465	580	685

Source: C. Pennycuik, *Newton Rules Biology*.

- Find a function that models the data.
 - Graph A and the data.
 - What weight corresponds to a wing area of 500 square inches?
22. **Wing Span** Heavier birds tend to have a longer wing span than smaller birds. For one species of bird, the table lists the length L of the bird's wing span in feet if the bird weighs w pounds.

w (lb)	0.22	0.88	1.76	2.42
$L(w)$ (ft)	1.38	2.19	2.76	3.07

Source: C. Pennycuik, *Newton Rules Biology*.

- Find a function that models the data.
 - Graph L and the data.
 - What weight corresponds to a wing span of 2 feet?
23. **Tree Growth** (Refer to the introduction to this section.) The height H of a tree in feet after x years is listed in the table.

x (yr)	1	5	10	20	30	40
$H(x)$ (ft)	1.3	3	8	32	47	50

- Evaluate $H(5)$ and interpret the answer.
- Find a function that models the data.
- Graph H and the data.
- What is the age of the tree when its height is 25 feet?
- Did your answer involve interpolation or extrapolation?

24. **Bird Populations** Near New Guinea there is a relationship between the number of bird species found on an island and the size of the island. The table lists the number of species of birds y found on an island with an area of x square kilometers.

x (km ²)	0.1	1	10	100	1000
y (species)	10	15	20	25	30

Source: B. Freedman, *Environmental Ecology*.

- Find a function f that models the data.
- Predict the number of bird species on an island of 5000 square kilometers.
- Did your answer involve interpolation or extrapolation?

25. **Fertilizer Usage** Between 1950 and 1980 the use of chemical fertilizers increased. The table lists worldwide average usage y in kilograms per hectare of cropland, x years after 1950. (Note: 1 hectare \approx 2.47 acres.)

x	0	13	22	29
y	12.4	27.9	54.3	77.1

Source: D. Grigg.

- Graph the data. Are the data linear?
- Find a function f that models the data.
- Predict fertilizer usage in 1989. The actual value was 98.7 kilograms per hectare. What does this indicate about usage of fertilizer during the 1980s?

26. **Social Security** If major reform occurs in the Social Security system, individuals may be able to invest some of their contributions into individual accounts. These accounts would be managed by financial firms, which often charge fees. The table lists the amount in billions of dollars that may be collected if fees are 0.93% of the assets each year.

Year	2005	2010	2015	2020
Fees (\$ billions)	20	41	80	136

Source: Social Security Advisory Council.

- Use exponential regression to find a and b so that $f(x) = ab^x$ models the data x years after 2000.
- Graph f and the data.
- Estimate the fees in 2013.
- Did your answer involve interpolation or extrapolation?

Writing about Mathematics

- How can you distinguish data that illustrate exponential growth from data that illustrate logarithmic growth?
- Give an example of data that could be modeled by a logistic function and explain why.

EXTENDED AND DISCOVERY EXERCISE

1. For medical reasons, dyes may be injected into the bloodstream to determine the health of internal organs. In one study involving animals, the dye BSP was injected to assess the blood flow in the liver. The results are listed in the table, where x represents the elapsed time in minutes and y is the concentration of the dye in the bloodstream in milligrams per milliliter.

x	1	2	3	4	5	7
y	0.102	0.077	0.057	0.045	0.036	0.023

x	9	13	16	19	22
y	0.015	0.008	0.005	0.004	0.003

Source: F. Harrison, "The measurement of liver blood flow in conscious calves."

- (a) Find a function that models the data.
- (b) Estimate the elapsed time when the concentration of the dye reaches 30% of its initial concentration of 0.133 mg/ml.
- (c) Let $g(x) = 0.133(0.878(0.73^x) + 0.122(0.92^x))$. This formula was used by the researchers to model the data. Compare the accuracy of your formula to that of $g(x)$.

CHECKING BASIC CONCEPTS FOR SECTION 5.7

 Exercises 1–4: Find a function that models the data. Choose from exponential, logarithmic, or logistic functions.

Summary

CONCEPT

EXPLANATION AND EXAMPLES

SECTION 5.1 COMBINING FUNCTIONS

Arithmetic Operations on Functions

Addition: $(f + g)(x) = f(x) + g(x)$
 Subtraction: $(f - g)(x) = f(x) - g(x)$
 Multiplication: $(fg)(x) = f(x) \cdot g(x)$
 Division: $(f/g)(x) = \frac{f(x)}{g(x)}, g(x) \neq 0$

Examples: Let $f(x) = x^2 - 5$, $g(x) = x^2 - 4$.
 $(f + g)(x) = (x^2 - 5) + (x^2 - 4) = 2x^2 - 9$
 $(f - g)(x) = (x^2 - 5) - (x^2 - 4) = -1$
 $(fg)(x) = (x^2 - 5)(x^2 - 4) = x^4 - 9x^2 + 20$
 $(f/g)(x) = \frac{x^2 - 5}{x^2 - 4}, x \neq 2, x \neq -2$

CONCEPT**EXPLANATION AND EXAMPLES****SECTION 5.1 COMBINING FUNCTIONS (CONTINUED)****Composition of Functions**

Composition: $(g \circ f)(x) = g(f(x))$
 $(f \circ g)(x) = f(g(x))$

Examples: Let $f(x) = 3x + 2$, $g(x) = 2x^2 - 4x + 1$.
 $g(f(x)) = g(3x + 2)$
 $= 2(3x + 2)^2 - 4(3x + 2) + 1$
 $f(g(x)) = f(2x^2 - 4x + 1)$
 $= 3(2x^2 - 4x + 1) + 2$
 $= 6x^2 - 12x + 5$

SECTION 5.2 INVERSE FUNCTIONS AND THEIR REPRESENTATIONS**Inverse Function**

The inverse function of f is f^{-1} if
 $f^{-1}(f(x)) = x$ for every x in the domain of f and
 $f(f^{-1}(x)) = x$ for every x in the domain of f^{-1} .
Note: If $f(a) = b$, then $f^{-1}(b) = a$.

Example: Find the inverse function of $f(x) = 4x - 5$.
 $y = 4x - 5$ is equivalent to $\frac{y + 5}{4} = x$. (Solve for x .)
Thus $f^{-1}(x) = \frac{x + 5}{4}$.

One-to-One Function

If different inputs always result in different outputs, then f is one-to-one. That is, $a \neq b$ implies $f(a) \neq f(b)$.
Note: If f is one-to-one, then f has an inverse denoted f^{-1} .

Example: $f(x) = x^2 + 1$ is not one-to-one because $f(2) = f(-2) = 5$.

Horizontal Line Test

If every horizontal line intersects the graph of a function f at most once, then f is a one-to-one function.

SECTION 5.3 EXPONENTIAL FUNCTIONS AND MODELS**Exponential Function**

$f(x) = Ca^x$, $a > 0$, $a \neq 1$, and $C > 0$
Exponential growth: $a > 1$; exponential decay: $0 < a < 1$

Examples: $f(x) = 3(2)^x$ (growth); $f(x) = 1.2(0.5)^x$ (decay)

Exponential Data

For each unit increase in x , the y -values increase (or decrease) by a constant factor a .

Example: The data in the table are modeled by $y = 5(2)^x$.

x	0	1	2	3
y	5	10	20	40

CONCEPT EXPLANATION AND EXAMPLES

SECTION 5.3 EXPONENTIAL FUNCTIONS AND MODELS (CONTINUED)

Natural Exponential Function $f(x) = e^x$, where $e \approx 2.718282$

Compound Interest $A = P\left(1 + \frac{r}{n}\right)^{nt}$, where P is the principal, r is the interest expressed as a decimal, n is the number of times interest is paid each year, and t is the number of years

Example: $A = 2000\left(1 + \frac{0.10}{12}\right)^{12(4)} \approx \2978.71

calculates the future value of \$2000 invested at 10% compounded monthly for 4 years.

Continuously Compounded Interest $A = Pe^{rt}$, where P is the principal, r is the interest expressed as a decimal, and t is the number of years

Example: $A = 2000e^{0.10(4)} \approx \2983.65

calculates the future value of \$2000 invested at 10% compounded continuously for 4 years.

SECTION 5.4 LOGARITHMIC FUNCTIONS AND MODELS

Common Logarithm $\log x = k$ if and only if $x = 10^k$

Natural Logarithm $\ln x = k$ if and only if $x = e^k$

General Logarithm $\log_a x = k$ if and only if $x = a^k$

Examples: $\log 100 = 2$ because $100 = 10^2$.

$\ln \sqrt{e} = \frac{1}{2}$ because $\sqrt{e} = e^{1/2}$.

$\log_2 \frac{1}{8} = -3$ because $\frac{1}{8} = 2^{-3}$

Inverse Properties

$$\begin{array}{ll} \log 10^k = k, & 10^{\log k} = k, \quad k > 0 \\ \ln e^k = k, & e^{\ln k} = k, \quad k > 0 \\ \log_a a^k = k, & a^{\log_a k} = k, \quad k > 0 \end{array}$$

Examples: $10^{\log 100} = 100$; $e^{\ln 23} = 23$; $\log_4 64 = \log_4 4^3 = 3$

Inverse Functions The inverse function of $f(x) = a^x$ is $f^{-1}(x) = \log_a x$.

Examples: If $f(x) = 10^x$, then $f^{-1}(x) = \log x$.

If $f(x) = \ln x$, then $f^{-1}(x) = e^x$.

If $f(x) = \log_5 x$, then $f^{-1}(x) = 5^x$.

Exponential and Logarithm Forms $\log_a x = k$ is equivalent to $x = a^k$.

Examples: $\log_2 16 = 4$ is equivalent to $16 = 2^4$.
 $81 = 3^4$ is equivalent to $\log_3 81 = 4$.

CONCEPTS, DEFINITIONS, EXPLANATION AND EXAMPLES

SECTION 5.5 PROPERTIES OF LOGARITHMS

Properties of Logarithms

1. $\log_a 1 = 0$ and $\log_a a = 1$
2. $\log_a m + \log_a n = \log_a (mn)$
3. $\log_a m - \log_a n = \log_a \left(\frac{m}{n}\right)$
4. $\log_a (m^r) = r \log_a m$

- Examples:**
1. $\log_4 1 = 0$ and $\log_4 4 = 1$
 2. $\log 2 + \log 5 = \log (2 \cdot 5) = \log 10 = 1$
 3. $\log 500 - \log 5 = \log (500/5) = \log 100 = 2$
 4. $\log_2 2^3 = 3 \log_2 2 = 3(1) = 3$

Change of Base Formula

$$\log_a x = \frac{\log_b x}{\log_b a}$$

Example: $\log_3 23 = \frac{\log 23}{\log 3} \approx 2.854$

SECTION 5.6 EXPONENTIAL AND LOGARITHMIC EQUATIONS

Solving Exponential Equations

To solve an exponential equation we typically take the logarithm of each side.

Example:

$4e^x = 48$	Given equation
$e^x = 12$	Divide by 4.
$\ln e^x = \ln 12$	Take the natural logarithm.
$x = \ln 12$	Inverse property
$x \approx 2.485$	Approximate.

Solving Logarithmic Equations

To solve a logarithmic equation we typically need to exponentiate each side.

Example:

$5 \log_3 x = 10$	Given equation
$\log_3 x = 2$	Divide by 5.
$3^{\log_3 x} = 3^2$	Exponentiate; base 3.
$x = 9$	Inverse property

SECTION 5.7 CONSTRUCTING NONLINEAR MODELS

Exponential Model

$$f(x) = Ca^x, \quad f(x) = ab^x, \quad \text{or} \quad A(t) = A_0 e^{kt}$$

Models data that increase or decrease rapidly

Logarithmic Model

$$f(x) = a + b \ln x \quad \text{or} \quad f(x) = a + b \log x$$

Models data that increase slowly

Logistic Model

$$f(x) = \frac{c}{1 + ae^{-bx}}, \quad a, b, \text{ and } c \text{ are positive constants}$$

Models data that increase slowly at first, then increase more rapidly, and finally level off near the value of c . Its graph is a sigmoidal curve. See Figure 5.93.

5

Review Exercises

1. Use the tables to evaluate, if possible.

x	-1	0	1	3
$f(x)$	3	5	7	9

x	-1	0	1	3
$g(x)$	-2	0	1	9

- (a) $(f + g)(1)$ (b) $(f - g)(3)$
 (c) $(fg)(-1)$ (d) $(f/g)(0)$
2. Use the graph to evaluate each expression.
 (a) $(f - g)(2)$ (b) $(fg)(0)$

3. Let $f(x) = x^2$ and $g(x) = 1 - x$ and evaluate.
 (a) $(f + g)(3)$ (b) $(f - g)(-2)$
 (c) $(fg)(1)$ (d) $(f/g)(3)$
4. Use $f(x) = x^2 + 3x$ and $g(x) = x^2 - 1$ to find each expression. Identify its domain.
 (a) $(f + g)(x)$ (b) $(f - g)(x)$
 (c) $(fg)(x)$ (d) $(f/g)(x)$
5. Numerical representations for f and g are given by the tables. Evaluate each expression.

x	-2	0	2	4
$f(x)$	1	4	3	2

x	1	2	3	4
$g(x)$	2	4	-2	0

- (a) $(g \circ f)(-2)$ (b) $(f \circ g)(3)$ (c) $f^{-1}(3)$
6. Use the graph at the top of the next column to evaluate each expression.
 (a) $(f \circ g)(2)$ (b) $(g \circ f)(0)$ (c) $f^{-1}(1)$

7. Let $f(x) = \sqrt{x}$ and $g(x) = x^2 + x$ and evaluate.
 (a) $(f \circ g)(2)$ (b) $(g \circ f)(9)$
8. Use $f(x) = x^2 + 1$ and $g(x) = x^3 - x^2 + 2x + 1$ to find each expression.
 (a) $(f \circ g)(x)$ (b) $(g \circ f)(x)$

Exercises 9–12: Find $(f \circ g)(x)$ and identify its domain.

9. $f(x) = x^3 - x^2 + 3x - 2$ $g(x) = x^{-1}$
 10. $f(x) = \sqrt{x + 3}$ $g(x) = 1 - x^2$
 11. $f(x) = \sqrt[3]{2x - 1}$ $g(x) = \frac{1}{2}x^3 + \frac{1}{2}$
 12. $f(x) = \frac{2}{x - 5}$ $g(x) = \frac{1}{x + 1}$

Exercises 13 and 14: Find f and g so that $h(x) = (g \circ f)(x)$.

13. $h(x) = \sqrt{x^2 + 3}$ 14. $h(x) = \frac{1}{(2x + 1)^2}$

Exercises 15 and 16: Describe the inverse operations of the given statement. Then express both the statement and its inverse symbolically.

15. Divide x by 10 and add 6.
 16. Subtract 5 from x and take the cube root.

Exercises 17 and 18: Determine if f is one-to-one.

17. $f(x) = 3x - 1$ 18. $f(x) = 3x^2 - 2x + 1$

Exercises 19 and 20: Determine if f is one-to-one.

19.

20.

21. The table is a complete representation of f . Use the table of f to determine a table for f^{-1} . Identify the domains and ranges of f and f^{-1} .

x	-1	0	4	6
$f(x)$	6	4	3	1

22. Use the graph of f to sketch a graph of f^{-1} .

Exercises 23 and 24: Find $f^{-1}(x)$.

23. $f(x) = 3x - 5$ 24. $f(x) = \frac{3x}{x+7}$

25. Verify that $f(x) = 2x - 1$ and $f^{-1}(x) = \frac{x+1}{2}$ are inverses.

26. Restrict the domain of $f(x) = 2(x - 4)^2 + 3$ so that f is one-to-one. Then find $f^{-1}(x)$.

Exercises 27 and 28: Use the tables to evaluate the given expression.

x	0	1	2	3
$f(x)$	4	3	2	1

x	0	1	2	3
$g(x)$	0	2	3	4

27. $(f \circ g^{-1})(4)$ 28. $(g^{-1} \circ f^{-1})(1)$

29. Find $f^{-1}(x)$ if $f(x) = \sqrt{x+1}$, $x \geq -1$. Identify the domain and range of f and of f^{-1} .

30. Simplify $e^x e^{-2x}$.

Exercises 31 and 32: Find C and a so that $f(x) = Ca^x$ satisfies the given conditions.

31. $f(0) = 3$ and $f(3) = 24$

32. $f(-1) = 8$ and $f(1) = 2$

Exercises 33–36: Sketch a graph of $y = f(x)$. Identify the domain of f .

33. $f(x) = 4(2)^{-x}$

34. $f(x) = 3^{x-1}$

35. $f(x) = \log_4 x$

36. $f(x) = \log(x+1)$

Exercises 37 and 38: Use the graph of $f(x) = Ca^x$ to determine values for C and a .

37.

38.

39. Determine the final value of \$1200 invested at 9% compounded semiannually for 3 years.

40. Determine the final value of \$500 invested at 6.5% compounded continuously for 8 years.

41. Solve $e^x = 19$ symbolically.

42. Solve $2^x - x^2 = x$ graphically. Round each solution to the nearest thousandth.

Exercises 43–46: Evaluate the expression without a calculator.

43. $\log 1000$

44. $\log 0.001$

45. $10 \log 0.01 + \log \frac{1}{10}$

46. $\log 100 + \log \sqrt[3]{10}$

Exercises 47–50: Evaluate the logarithm without a calculator.

47. $\log_3 9$

48. $\log_5 \frac{1}{25}$

49. $\ln e$

50. $\log_2 32$

Exercises 51 and 52: Approximate to the nearest thousandth.

51. $\log_3 18$

52. $\log_2 173$

Exercises 53–60: Solve the equation.

53. $10^x = 125$

54. $1.5^x = 55$

55. $e^{0.1x} = 5.2$

56. $4e^{2x} - 5 = 3$

57. $5^{-x} = 10$

58. $3(10)^{-x} = 6$

59. $50 - 3(0.78)^{x-10} = 21$

60. $5(1.3)^x + 4 = 104$

Exercises 61 and 62: Find either a linear or an exponential function that models the data in the table.

61.

x	0	1	2
y	1.5	3	6

62.

x	0	1	2
y	3	4.5	6

Exercises 63–66: Solve the equation.

63. $\log x = 1.5$

64. $\log_3 x = 4$

65. $\ln x = 3.4$

66. $4 - \ln(5 - x) = \frac{5}{2}$

Exercises 67 and 68: Use properties of logarithms to write the expression as a logarithm of a single expression.

67. $\log 6 + \log 5x$

68. $\log \sqrt{3} - \log \sqrt[3]{3}$

69. Expand $\ln \frac{y}{x^2}$.

70. Expand $\log \frac{4x^3}{k}$.

Exercises 71–76: Solve the logarithmic equation.

71. $8 \log x = 2$

72. $\ln 2x = 2$

73. $2 \log 3x + 5 = 15$

74. $5 \log_2 x = 25$

75. $2 \log_5(x + 2) = \log_5(x + 8)$

76. $\ln(5 - x) - \ln(5 + x) = -\ln 9$

77. Suppose that b is the y -intercept on the graph of a one-to-one function f . What is the x -intercept on the graph of f^{-1} ? Explain your reasoning.

78. Let $f(x) = ax + b$ with $a \neq 0$.

(a) Show that f^{-1} is also linear by finding $f^{-1}(x)$.

(b) How is the slope of the graph of f related to the slope of the graph of f^{-1} ?

Applications

79. **Bacteria Growth** There are initially 4000 bacteria per milliliter in a sample, and after 1 hour their concentration increases to 6000 bacteria per milliliter. Assume exponential growth.

(a) How many bacteria are there after 2.5 hours?

(b) After how long are there 8500 bacteria per milliliter?

80. **Newton's Law of Cooling** A pan of boiling water with a temperature of 100°C is set in a room with a temperature of 20°C . The water cools to 50°C in 40 minutes.

(a) Find values for T_0 , D , and a so that the formula $T(t) = T_0 + Da^t$ models the data, where t is in hours.

(b) Find the temperature of the water after 90 minutes.

(c) How long does it take the water to reach 30°C ?

81. **Combining Functions** The total number of gallons of water passing through a pipe after x seconds is computed by $f(x) = 10x$. Another pipe delivers $g(x) = 5x$ gallons after x seconds. Find a function h that gives the volume of water passing through both pipes in x seconds.

82. **Test Scores** Let scores on a standardized test be modeled by $f(x) = 36e^{-(x-20)^2/49}$. The function f computes the number in thousands of people that received score x . Solve the equation $f(x) = 30$. Interpret your result.

83. **Modeling Growth** The function given by

$$W(x) = 175.6(1 - 0.66e^{-0.24x})^3$$

models the weight in milligrams of a small fish called the *Lebistes reticulatus* after x weeks, where $0 \leq x \leq 14$. Solve the equation $W(x) = 50$. Interpret the result. (Source: D. Brown and P. Rothery, *Models in Biology*.)

84. **Radioactive Decay** After 23 days, a 10-milligram sample of a radioactive material decays to 5 milligrams. After how many days will there be 1 milligram of the material?

85. **Tire Pressure** A car tire has a small leak, and the tire pressure in pounds per square inch after t minutes is given by $P(t) = 32e^{-0.2t}$. After how many minutes is the pressure 15 pounds per square inch?

86. **Converting Units** The figures show graphs of a function f that converts fluid ounces to pints and a function g that converts pints to quarts. Evaluate each expression. Interpret the results.

(a) $(g \circ f)(32)$

(b) $f^{-1}(1)$

(c) $(f^{-1} \circ g^{-1})(1)$

87. **Modeling Epidemics** In 1666 the village of Eyam, located in England, experienced an outbreak of the Great Plague. Out of 261 people in the community, only 83 people survived. The tables show a function f that computes the number of people who were infected after x days.

x	0	15	30	45
$f(x)$	7	21	57	111

x	60	75	90	125
$f(x)$	136	158	164	178

Source: G. Raggett, "Modeling the Eyam plague."

Find a function f that models the given data. (Answers may vary.)

88. **Greenhouse Gases** Methane is a greenhouse gas that is produced when fossil fuels are burned. In 1600 methane had an atmospheric concentration of 700 parts per billion (ppb), whereas in 2000 its concentration was about 1700 ppb. (Source: D. Wuebbles and J. Edmonds, *Primer on Greenhouse Gases*.)

(a) Find values for C and a so that $f(x) = Ca^x$ models the data, where x is the year.

(b) Solve $f(x) = 1000$ and interpret the answer.

89. **Exponential Regression** The data in the table can be modeled by $f(x) = ab^x$. Use regression to estimate the constants a and b . Graph f and the data.

x	1	2	3	4
y	2.59	1.92	1.42	1.05

90. **Logarithmic Regression** The data in the table can be modeled by $f(x) = a + b \ln x$. Use regression to estimate the constants a and b . Graph f and the data.

x	2	3	4	5
y	2.93	3.42	3.76	4.03

EXTENDED AND DISCOVERY EXERCISES

1. **Modeling Data with Power Functions** There is a procedure to determine whether data can be modeled by $y = ax^b$, where a and b are constants. Start by taking the natural logarithm of each side of this equation.

$$\ln y = \ln(ax^b)$$

$$\ln y = \ln a + \ln x^b \quad \ln(mn) = \ln m + \ln n$$

$$\ln y = \ln a + b \ln x \quad \ln(m^r) = r \ln m$$

If we let $z = \ln y$, $d = \ln a$, and $w = \ln x$, then the equation $\ln y = \ln a + b \ln x$ becomes $z = d + bw$. Thus the data points $(w, z) = (\ln x, \ln y)$ lie on the line having a slope of b and y -intercept $d = \ln a$. The following steps provide a procedure for finding the constants a and b .

Modeling Data with the Equation $y = ax^b$

If a data set (x, y) can be modeled by the (power) equation $y = ax^b$, then the following procedure can be applied to determine the constants a and b .

STEP 1: Let $w = \ln x$ and $z = \ln y$ for each data point.

Graph the points (w, z) . If these data are not linear, then do *not* use this procedure.

STEP 2: Find an equation of a line in the form $z = bw + d$ that models the data points (w, z) . (Linear regression may be used.)

STEP 3: The slope of the line equals the constant b . The value of a is given by $a = e^d$.

Apply this procedure to the table of data for the orbital distances and periods of the moons of Jupiter. Let the distance be x and the period be y .

Moons of Jupiter	Distance (10^3 km)	Period (days)
Metis	128	0.29
Almathea	181	0.50
Thebe	222	0.67
Io	422	1.77
Europa	671	3.55
Ganymede	1070	7.16
Callisto	1883	16.69

2. **Global Warming** Greenhouse gases such as carbon dioxide trap heat from the sun. Presently, the net incoming solar radiation reaching Earth's surface is approximately 240 watts per square meter (w/m^2). Any portion of this amount that is due to greenhouse gases is called *radiative forcing*. The table lists the estimated increase in radiative forcing R over the levels in 1750.

x (year)	1800	1850	1900	1950	2000
$R(x)$ (w/m^2)	0.2	0.4	0.6	1.2	2.4

Source: A. Nilsson, *Greenhouse Earth*.

(a) Estimate constants C and k so that $R(x) = Ce^{kx}$ models the data. Let $x = 0$ correspond to 1800.

(b) Estimate the year when the additional radiative forcing could reach $3 \text{ w}/\text{m}^2$.

3. **Global Warming** (Refer to Exercise 2.) The relationship between radiative forcing R and the increase in average global temperature T in degrees Fahrenheit can be modeled by $T(R) = 1.03R$. For example, $T(2) = 1.03(2) = 2.06$ means that if Earth's atmosphere traps an additional 2 watts per square meter, then the average global temperature may increase by 2.06°F if all other factors remained constant. (Source: W. Clime, *The Economics of Global Warming*.)

(a) Use $R(x)$ from Exercise 2 to express $(T \circ R)(x)$ symbolically, where x is the year and $x = 0$ corresponds to the year 1800.

(b) Evaluate $(T \circ R)(100)$ and interpret its meaning.

 Exercises 4 and 5: Try to decide if the expression is precisely an integer. (Hint: Use computer software capable of calculating a large number of decimal places.)

4. $\left(\frac{1}{\pi} \ln(640,320^3 + 744)\right)^2$

(Source: I. J. Good, "What is the most amazing approximate integer in the universe?")

5. $e^{\pi\sqrt{163}}$ (Source: W. Cheney and D. Kincaid, *Numerical Mathematics and Computing*.)

Reference: Basic Concepts from Algebra and Geometry

R

Throughout the text there are algebra and geometry review notes that direct students to “see Chapter R.” This reference chapter contains seven sections, which provide a review of important topics from algebra and geometry. Students can refer to these sections for more explanation or extra practice. Instructors can use these sections to emphasize a variety of mathematical skills.

R.1 Formulas from Geometry

- Use formulas for shapes in a plane
- Find sides of right triangles by applying the Pythagorean theorem
- Apply formulas to three-dimensional objects
- Use similar triangles to solve problems

Geometric Shapes in a Plane

This subsection discusses formulas related to rectangles, triangles, and circles.

Rectangles The distance around the boundary of a geometric shape in a plane is called its **perimeter**. The perimeter of a rectangle equals the sum of the lengths of its four sides. For example, the perimeter of the rectangle shown in Figure R.1 is $5 + 4 + 5 + 4 = 18$ feet. The perimeter P of a rectangle with length L and width W is $P = 2L + 2W$.

Figure R.1 Rectangle

The area A of a rectangle equals the product of its length and width: $A = LW$. So the rectangle in Figure R.1 has an area of $5 \cdot 4 = 20$ square feet.

Many times the perimeter or area of a rectangle is written in terms of variables, as demonstrated in the next example.

EXAMPLE 1 Finding the perimeter and area of a rectangle

The length of a rectangle is three times greater than its width. If the width is x inches, write expressions that give the perimeter and area.

Figure R.2

Figure R.3 Triangle

SOLUTION The width of the rectangle is x inches, so its length is $3x$ inches. A sketch is shown in Figure R.2. The perimeter is

$$\begin{aligned} P &= 2L + 2W \\ &= 2(3x) + 2(x) \\ &= 8x \text{ inches.} \end{aligned}$$

The area is $A = LW = 3x \cdot x = 3x^2$ square inches.

Now Try Exercise 7 ◀

Triangles If the base of a triangle is b and its height is h , as illustrated in Figure R.3, then the area A of the triangle is given by

$$A = \frac{1}{2}bh.$$

EXAMPLE 1 Finding the area of a triangle

Calculate the area of the triangle.

SOLUTION The triangle has a base of 8 feet and a height of 5 feet. Therefore its area is

$$A = \frac{1}{2}bh = \frac{1}{2} \cdot 8 \cdot 5 = 20 \text{ square feet.}$$

Now Try Exercise 11 ◀

Figure R.4 Circle

Circles The perimeter of a circle is called its **circumference** C and is given by $C = 2\pi r$, where r is the radius of the circle. The area A of a circle is $A = \pi r^2$. See Figure R.4.

EXAMPLE 2 Finding the circumference and area of a circle

A circle has a radius of 12.5 inches. Approximate its circumference and area.

SOLUTION

Circumference: $C = 2\pi r = 2\pi(12.5) = 25\pi \approx 78.5$ inches

Area: $A = \pi r^2 = \pi(12.5)^2 = 156.25\pi \approx 490.9$ square inches

Now Try Exercise 21 ◀

The Pythagorean Theorem

One of the most famous theorems in mathematics is the Pythagorean theorem. It states that a triangle with legs a and b and hypotenuse c is a right triangle if and only if

$$a^2 + b^2 = c^2,$$

as illustrated in Figure R.5.

Figure R.5 $a^2 + b^2 = c^2$

Figure R.6

EXAMPLE 1 Finding the perimeter of a right triangle

Find the perimeter of the triangle shown in Figure R.6.

SOLUTION Given one leg and the hypotenuse of a right triangle, we can use the Pythagorean theorem to find the other leg. Let $a = 7$, $c = 25$, and find b .

$$\begin{aligned} a^2 + b^2 &= c^2 && \text{Pythagorean theorem} \\ b^2 &= c^2 - a^2 && \text{Subtract } a^2. \\ b^2 &= 25^2 - 7^2 && \text{Let } a = 7 \text{ and } c = 25. \\ b^2 &= 576 && \text{Simplify.} \\ b &= 24 && \text{Solve for } b > 0. \end{aligned}$$

The perimeter of the triangle is

$$a + b + c = 7 + 24 + 25 = 56 \text{ inches.}$$

Now Try Exercise 29 ◀

Figure R.7 Rectangular Box

Three-Dimensional Objects

Objects that occupy space have both volume and surface area. This subsection discusses rectangular boxes, spheres, cylinders, and cones.

Rectangular Boxes The volume V of a rectangular box with length L , width W , and height H equals $V = LWH$. See Figure R.7. The surface area S of the box equals the sum of the areas of the six sides: $S = 2LW + 2WH + 2LH$.

EXAMPLE 2 Finding the volume and surface area of a box

The box in Figure R.8 has dimensions x by $2x$ by y . Find its volume and surface area.

Figure R.8

SOLUTION

Volume: $LWH = 2x \cdot x \cdot y = 2x^2y$ cubic units

Surface Area: Base and top: $2x \cdot x + 2x \cdot x = 4x^2$
 Front and back: $xy + xy = 2xy$
 Left and right sides: $2xy + 2xy = 4xy$
 Total surface area: $4x^2 + 2xy + 4xy = 4x^2 + 6xy$ square units

Now Try Exercise 41 ◀

Figure R.9 Sphere

Spheres The volume V of a sphere with radius r is $V = \frac{4}{3}\pi r^3$, and its surface area S is $S = 4\pi r^2$. See Figure R.9.

EXAMPLE 6 Finding the volume and surface area of a sphere

Estimate, to the nearest tenth, the volume and surface area of a sphere with a radius of 5.1 feet.

SOLUTION

Volume: $V = \frac{4}{3}\pi r^3 = \frac{4}{3}\pi(5.1)^3 \approx 555.6$ cubic feet

Surface Area: $S = 4\pi r^2 = 4\pi(5.1)^2 \approx 326.9$ square feet

Now Try Exercise 47 ◀

Cylinders A soup can is usually made in the shape of a cylinder. The volume of a cylinder with radius r and height h is $V = \pi r^2 h$. See Figure R.10. To find the total surface area of a cylinder, we add the area of the top and bottom to the area of the side. Figure R.11 illustrates a can cut open to determine its surface area. The top and bottom are circular with areas of πr^2 each, and the side has a surface area of $2\pi rh$. The total surface area is $S = 2\pi r^2 + 2\pi rh$. The side surface area is called the **lateral surface area**.

Figure R.10 Cylinder

Figure R.11 A Cylinder Cut Open

EXAMPLE 7 Finding the volume and surface area of a cylinder

A cylinder has radius $r = 3$ inches and height $h = 2.5$ feet. Find its volume and total surface area to the nearest tenth.

SOLUTION Begin by changing 2.5 feet to 30 inches so that all units are in inches.

Volume: $V = \pi r^2 h = \pi(3)^2(30) = 270\pi \approx 848.2$ cubic inches

Total Surface Area: $S = 2\pi r^2 + 2\pi rh = 2\pi(3)^2 + 2\pi(3)(30) = 198\pi \approx 622.0$ square inches

Now Try Exercise 51 ◀

Figure R.12 Cone

Cones The volume of a cone with radius r and height h is $V = \frac{1}{3}\pi r^2 h$, as shown in Figure R.12. (Compare this formula with the formula for the volume of a cylinder.) Excluding the bottom of the cone, the side (or lateral) surface area is $S = \pi r \sqrt{r^2 + h^2}$. The bottom of the cone is circular and has a surface area of πr^2 .

EXAMPLE 8 Finding the volume and surface area of a cone

Approximate, to the nearest tenth, the volume and surface area (side only) of a cone with a radius of 1.45 inches and a height of 5.12 inches.

SOLUTION

Volume: $V = \frac{1}{3}\pi r^2 h = \frac{1}{3}\pi(1.45)^2(5.12) \approx 11.3$ cubic inches

Surface Area (side only): $S = \pi r \sqrt{r^2 + h^2} = \pi(1.45) \sqrt{(1.45)^2 + (5.12)^2} \approx 24.2$ square inches

Now Try Exercise 55 ◀

Similar Triangles

The corresponding angles of **similar triangles** have equal measure, but similar triangles are not necessarily the same size. Two similar triangles are shown in Figure R.13. Notice that both triangles have angles of 30° , 60° , and 90° . Corresponding sides are not equal in length; however, corresponding ratios are equal. For example, in triangle ABC the ratio of the shortest leg to the hypotenuse equals $\frac{2}{4} = \frac{1}{2}$, and in triangle DEF this ratio is $\frac{3}{6} = \frac{1}{2}$.

Figure R.13 Similar Triangles

EXAMPLE 1 Using similar triangles

Find the length of BC in Figure R.14.

SOLUTION Notice that triangle ABC and triangle ADE are both right triangles. These triangles share an angle at vertex A . Therefore triangles ABC and ADE have two corresponding angles that are congruent. Because the sum of the angles in a triangle equals 180° , all three corresponding angles in these two triangles are congruent. Thus triangles ABC and ADE are similar.

Since corresponding ratios are equal, we can find BC as follows.

$$\frac{BC}{AC} = \frac{DE}{AE}$$

$$\frac{BC}{5} = \frac{6}{7}$$

Solving this equation for BC gives $BC = \frac{30}{7} \approx 4.3$.

Now Try Exercise 61

NOTE For a summary of these formulas, see the back endpapers of this text.

Figure R.14

R.1 Exercises

Rectangles

Exercises 1–6: Find the area and perimeter of the rectangle with length L and width W .

1. $L = 15$ feet, $W = 7$ feet
2. $L = 16$ inches, $W = 10$ inches
3. $L = 100$ meters, $W = 35$ meters
4. $L = 80$ yards, $W = 13$ yards
5. $L = 3x$, $W = y$
6. $L = a + 5$, $W = a$

Exercises 7–10: Find the area and perimeter of the rectangle in terms of the width W .

7. The width W is half the length.
8. Triple the width W minus 3 equals the length.
9. The length equals the width W plus 5.
10. The length is 2 less than twice the width W .

Triangles

Exercises 11 and 12: Find the area of the triangle shown in the figure.

11.

12.

Exercises 13–20: Find the area of the triangle with base b and height h .

13. $b = 5$ inches, $h = 8$ inches

14. $b = 24$ inches, $h = 9$ feet

15. $b = 10.1$ meters, $h = 730$ meters

16. $b = 52$ yards, $h = 102$ feet

17. $b = 2x$, $h = 6x$

18. $b = x$, $h = x + 4$

19. $b = z$, $h = 5z$

20. $b = y + 1$, $h = 2y$

Circles

Exercises 21–26: Find the circumference and area of the circle. Approximate each value to the nearest tenth when appropriate.

21. $r = 4$ meters

22. $r = 1.5$ feet

23. $r = 19$ inches

24. $r = 22$ miles

25. $r = 2x$

26. $r = 5z$

Pythagorean Theorem

Exercises 27–32: Use the Pythagorean theorem to find the missing side of the right triangle with legs a and b and hypotenuse c . Then calculate the perimeter. Approximate values to the nearest tenth when appropriate.

27. $a = 60$ feet, $b = 11$ feet

28. $a = 21$ feet, $b = 11$ yards

29. $a = 5$ centimeters, $c = 13$ centimeters

30. $a = 6$ meters, $c = 15$ meters

31. $b = 7$ millimeters, $c = 10$ millimeters

32. $b = 1.2$ miles, $c = 2$ miles

Exercises 33–36: Find the area of the right triangle that satisfies the conditions. Approximate values to the nearest tenth when appropriate.

33. Legs with lengths 3 feet and 6 feet

34. Hypotenuse 10 inches and leg 6 inches

35. Hypotenuse 15 inches and leg 11 inches

36. Shorter leg 40 centimeters and hypotenuse twice the shorter leg

Rectangular Boxes

Exercises 37–44: Find the volume and surface area of a rectangular box with length L , width W , and height H .

37. $L = 4$ feet, $W = 3$ feet, $H = 2$ feet

38. $L = 6$ meters, $W = 4$ meters, $H = 1.5$ meters

39. $L = 4.5$ inches, $W = 4$ inches, $H = 1$ foot

40. $L = 9.1$ yards, $W = 8$ yards, $H = 6$ feet

41. $L = 3x$, $W = 2x$, $H = x$

42. $L = 6z$, $W = 5z$, $H = 7z$

43. $L = x$, $W = 2y$, $H = 3z$

44. $L = 8x$, $W = y$, $H = z$

Exercises 45 and 46: Find the volume of the rectangular box in terms of the width W .

45. The length is twice the width W , and the height is half the width.

46. The width W is three times the height and one-third of the length.

Spheres

Exercises 47–50: Find the volume and surface area of the sphere satisfying the given condition, where r is the radius and d is the diameter. Approximate values to the nearest tenth.

47. $r = 3$ feet

48. $r = 4.1$ inches

49. $d = 6.4$ meters

50. $d = 16$ feet

Cylinders

Exercises 51–54: Find the volume, the surface area of the side, and the total surface area of the cylinder that satisfies the given conditions, where r is the radius and h is the height. Approximate values to the nearest tenth.

51. $r = 0.5$ foot, $h = 2$ feet

52. $r = \frac{1}{3}$ yard, $h = 2$ feet

53. $r = 12$ millimeters, and h is twice r

54. r is one-fourth of h , and $h = 2.1$ feet

Cones

Exercises 55–60: Approximate, to the nearest tenth, the volume and surface area (side only) of the cone satisfying the given conditions, where r is the radius and h is the height.

55. $r = 5$ centimeters, $h = 6$ centimeters

56. $r = 8$ inches, $h = 30$ inches

57. $r = 24$ inches, $h = 3$ feet

58. $r = 100$ centimeters, $h = 1.3$ meters

59. Three times r equals h , and $r = 2.4$ feet

60. Twice h equals r , and $h = 3$ centimeters

Similar Triangles

Exercises 61–64: Use the fact that triangles ABC and DEF are similar to find the value of x .

61.

62.

63.

64.

R.2 Integer Exponents

- Use bases and exponents
- Use zero and negative exponents
- Apply the product, quotient, and power rules

Bases and Positive Exponents

The expression 8^2 is an exponential expression with base 8 and exponent 2. Table R.1 contains examples of other exponential expressions.

Table R.1

Expression	Base	Exponent
$2 \cdot 2 \cdot 2 = 2^3$	2	3
$6 \cdot 6 \cdot 6 \cdot 6 = 6^4$	6	4
$7 = 7^1$	7	1
$0.5 \cdot 0.5 = 0.5^2$	0.5	2
$x \cdot x \cdot x = x^3$	x	3

We read 0.5^2 as “0.5 squared,” 2^3 as “2 cubed,” and 6^4 as “6 to the fourth power.”

EXAMPLE 1 Writing numbers in exponential notation

Use the given base to write each number as an exponential expression. Check your results with a calculator.

- (a) 10,000 (base 10) (b) 27 (base 3) (c) 32 (base 2)

SOLUTION

(a) $10,000 = 10 \cdot 10 \cdot 10 \cdot 10 = 10^4$ (b) $27 = 3 \cdot 3 \cdot 3 = 3^3$

(c) $32 = 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 = 2^5$

These values are supported in Figure R.15, where exponential expressions are evaluated with a graphing calculator, using the \wedge key. **Now Try Exercises 11, 13, and 15** ◀

10^4	
3^3	10000
2^5	27
	32

Figure R.15

Zero and Negative Exponents

Exponents can be defined for any integer. The following box lists some properties for integer exponents.

Integer Exponents

Let a and b be nonzero real numbers and m and n be positive integers. Then

1. $a^n = a \cdot a \cdot a \cdots a$ (n factors of a)

2. $a^0 = 1$ (Note: 0^0 is undefined.)

3. $a^{-n} = \frac{1}{a^n}$ and $\frac{1}{a^{-n}} = a^n$

4. $\frac{a^{-n}}{b^{-m}} = \frac{b^m}{a^n}$

5. $\left(\frac{a}{b}\right)^{-n} = \left(\frac{b}{a}\right)^n$

EXAMPLE 2 Evaluating expressions

Evaluate each expression.

(a) 3^{-4} (b) $\frac{1}{2^{-3}}$ (c) $\left(\frac{5}{7}\right)^{-2}$ (d) $\frac{1}{(xy)^{-1}}$ (e) $\frac{2^{-2}}{3t^{-3}}$

SOLUTION

(a) $3^{-4} = \frac{1}{3^4} = \frac{1}{3 \cdot 3 \cdot 3 \cdot 3} = \frac{1}{81}$ (b) $\frac{1}{2^{-3}} = 2^3 = 2 \cdot 2 \cdot 2 = 8$

(c) $\left(\frac{5}{7}\right)^{-2} = \left(\frac{7}{5}\right)^2 = \frac{7}{5} \cdot \frac{7}{5} = \frac{49}{25}$ (d) $\frac{1}{(xy)^{-1}} = (xy)^1 = xy$

Base is xy .

(e) Note that only t , not $3t$, is raised to the power of -3 .

$$\frac{2^{-2}}{3t^{-3}} = \frac{t^3}{3(2^2)} = \frac{t^3}{3 \cdot 4} = \frac{t^3}{12}$$

Base is t . **Now Try Exercises 27, 29, 31, 65, and 67** ◀

Product, Quotient, and Power Rules

We can calculate products and quotients of exponential expressions *provided their bases are the same*. For example,

$$3^2 \cdot 3^3 = (3 \cdot 3) \cdot (3 \cdot 3 \cdot 3) = 3^5.$$

This expression has a total of $2 + 3 = 5$ factors of 3, so the result is 3^5 . To multiply exponential expressions with *like bases*, add exponents.

The Product Rule

For any nonzero number a and integers m and n ,

$$a^m \cdot a^n = a^{m+n}.$$

The product rule holds for negative exponents. For example,

$$10^5 \cdot 10^{-2} = 10^{5+(-2)} = 10^3.$$

EXAMPLE Using the product rule

Multiply and simplify.

(a) $7^3 \cdot 7^{-4}$ (b) $x^3 x^{-2} x^4$ (c) $(3y^2)(2y^{-4})$

SOLUTION

(a) $7^3 \cdot 7^{-4} = 7^{3+(-4)} = 7^{-1} = \frac{1}{7}$ (b) $x^3 x^{-2} x^4 = x^{3+(-2)+4} = x^5$

(c) $(3y^2)(2y^{-4}) = 3 \cdot 2 \cdot y^2 \cdot y^{-4} = 6y^{2+(-4)} = 6y^{-2} = \frac{6}{y^2}$

Note that 6 is not raised to the power of -2 in the expression $6y^{-2}$.

Now Try Exercises 35, 37, and 39

Consider division of exponential expressions using the following example.

$$\frac{6^5}{6^3} = \frac{6 \cdot 6 \cdot 6 \cdot 6 \cdot 6}{6 \cdot 6 \cdot 6} = 6 \cdot 6 = 6^2$$

After simplifying, there are two 6s left in the numerator. The result is $6^{5-3} = 6^2 = 36$. To divide exponential expressions with *like bases*, subtract exponents.

The Quotient Rule

For any nonzero number a and integers m and n ,

$$\frac{a^m}{a^n} = a^{m-n}.$$

The quotient rule holds true for negative exponents. For example,

$$\frac{2^6}{2^4} = 2^{6-4} = 2^2 = \frac{1}{2^2} = \frac{1}{4}.$$

This result is supported by Figure R.16.

$$\frac{2^{-6}}{2^{-4}} = .25 = \frac{1}{4}$$

Figure R.16

EXAMPLE 4 Using the quotient rule

Simplify the expression. Use positive exponents.

(a) $\frac{10^4}{10^6}$ (b) $\frac{x^5}{x^2}$ (c) $\frac{15x^2y^3}{5x^4y}$

SOLUTION

(a) $\frac{10^4}{10^6} = 10^{4-6} = 10^{-2} = \frac{1}{10^2} = \frac{1}{100}$ (b) $\frac{x^5}{x^2} = x^{5-2} = x^3$
 (c) $\frac{15x^2y^3}{5x^4y} = \frac{15}{5} \cdot \frac{x^2}{x^4} \cdot \frac{y^3}{y^1} = 3 \cdot x^{(2-4)}y^{(3-1)} = 3x^{-2}y^2 = \frac{3y^2}{x^2}$

Now Try Exercises 45, 47, and 51 ◀

How should we evaluate $(4^3)^2$? To answer this question, consider

$$(4^3)^2 = 4^3 \cdot 4^3 = 4^{3+3} = 4^6.$$

Similarly,

$$(x^4)^3 = x^4 \cdot x^4 \cdot x^4 = x^{4+4+4} = x^{12}.$$

These results suggest that to raise a power to a power, we must multiply the exponents.

Raising Powers to PowersFor any nonzero real number a and integers m and n ,

$$(a^m)^n = a^{mn}.$$

EXAMPLE 5 Raising powers to powers

Simplify each expression. Use positive exponents.

(a) $(5^2)^3$ (b) $(2^4)^{-2}$ (c) $(b^{-7})^5$

SOLUTION

(a) $(5^2)^3 = 5^{2 \cdot 3} = 5^6 = 15,625$ (b) $(2^4)^{-2} = 2^{4(-2)} = 2^{-8} = \frac{1}{2^8} = \frac{1}{256}$
 (c) $(b^{-7})^5 = b^{-7 \cdot 5} = b^{-35} = \frac{1}{b^{35}}$

Now Try Exercises 55, 56, and 57 ◀

How can we simplify the expression $(2x)^3$? Consider the following.

$$(2x)^3 = 2x \cdot 2x \cdot 2x = (2 \cdot 2 \cdot 2) \cdot (x \cdot x \cdot x) = 2^3x^3$$

This result suggests that to cube a product, we can cube each factor.

Raising Products to PowersFor any nonzero real numbers a and b and integer n ,

$$(ab)^n = a^n b^n.$$

EXAMPLE 6 Raising products to powers

Simplify each expression. Use positive exponents.

(a) $(6y)^2$ (b) $(x^2y)^{-2}$ (c) $(2xy^3)^4$

SOLUTION

(a) $(6y)^2 = 6^2y^2 = 36y^2$ (b) $(x^2y)^{-2} = (x^2)^{-2}y^{-2} = x^{-4}y^{-2} = \frac{1}{x^4y^2}$

(c) $(2xy^3)^4 = 2^4x^4(y^3)^4 = 16x^4y^{12}$

Now Try Exercises 59, 60, and 73 ◀

To simplify a power of a quotient, use the following rule.

Raising Quotients to PowersFor nonzero numbers a and b and any integer n ,

$$\left(\frac{a}{b}\right)^n = \frac{a^n}{b^n}.$$

EXAMPLE 7 Raising quotients to powers

Simplify each expression. Use positive exponents.

(a) $\left(\frac{3}{x}\right)^3$ (b) $\left(\frac{1}{2^3}\right)^{-2}$ (c) $\left(\frac{3x^{-3}}{y^2}\right)^4$

SOLUTION

(a) $\left(\frac{3}{x}\right)^3 = \frac{3^3}{x^3} = \frac{27}{x^3}$ (b) $\left(\frac{1}{2^3}\right)^{-2} = \frac{1^{-2}}{(2^3)^{-2}} = \frac{1}{2^{-6}} = 2^6 = 64$

(c) $\left(\frac{3x^{-3}}{y^2}\right)^4 = \frac{3^4(x^{-3})^4}{(y^2)^4} = \frac{81x^{-12}}{y^8} = \frac{81}{x^{12}y^8}$

Now Try Exercises 61, 63, and 81 ◀

In the next example, we use several properties of exponents to simplify expressions.

EXAMPLE 8 Simplifying expressions

Write each expression using positive exponents. Simplify the result completely.

(a) $\left(\frac{x^2y^{-3}}{3z^{-4}}\right)^{-2}$ (b) $\frac{(rt^3)^{-3}}{(r^2t^3)^{-2}}$

SOLUTION

$$\begin{aligned}
 \text{(a)} \quad \left(\frac{x^2y^{-3}}{3z^{-4}}\right)^{-2} &= \left(\frac{3z^{-4}}{x^2y^{-3}}\right)^2 & \text{(b)} \quad \frac{(rt^3)^{-3}}{(r^2t^3)^{-2}} &= \frac{(r^2t^3)^2}{(rt^3)^3} \\
 &= \left(\frac{3y^3}{x^2z^4}\right)^2 & &= \frac{r^4t^6}{r^3t^9} \\
 &= \frac{9y^6}{x^4z^8} & &= \frac{r}{t^3}
 \end{aligned}$$

R.3 Polynomial Expressions

- Perform addition and subtraction on monomials
- Perform addition and subtraction on polynomials
- Apply the distributive property
- Perform multiplication on polynomials
- Find the product of a sum and difference
- Square a binomial

Addition and Subtraction of Monomials

A **term** is a number, a variable, or a *product* of numbers and variables raised to powers. Examples of terms include

$$-15, \quad y, \quad x^4, \quad 3x^3z, \quad x^{-1/2}y^{-2}, \quad \text{and} \quad 6x^{-1}y^3.$$

If the variables in a term have only *nonnegative integer* exponents, the term is called a *monomial*. Examples of monomials include

$$-4, \quad 5y, \quad x^2, \quad 5x^2z^6, \quad -xy^7, \quad \text{and} \quad 6xy^3.$$

If two terms contain the same variables raised to the same powers, we call them like terms. We can add or subtract *like* terms, but not *unlike* terms. For example, the terms

$$x^3 + y^3$$

cannot be combined because they are *unlike terms*. However,

$$x^3 + 3x^3 = (1 + 3)x^3 = 4x^3$$

because x^3 and $3x^3$ are *like terms*. To add or subtract monomials, we simply combine like terms, as illustrated in the next example.

EXAMPLE 1 Adding and subtracting monomials

Simplify each of the following expressions by combining like terms.

(a) $8x^2 - 4x^2 + x^3$ (b) $9x - 6xy^2 + 2xy^2 + 4x$

SOLUTION

(a) The terms $8x^2$ and $-4x^2$ are like terms, so they may be combined.

$$\begin{aligned} 8x^2 - 4x^2 + x^3 &= (8 - 4)x^2 + x^3 && \text{Combine like terms.} \\ &= 4x^2 + x^3 && \text{Simplify.} \end{aligned}$$

However, $4x^2$ and x^3 are unlike terms and cannot be combined.

(b) The terms $9x$ and $4x$ may be combined, as may $-6xy^2$ and $2xy^2$.

$$\begin{aligned} 9x - 6xy^2 + 2xy^2 + 4x &= 9x + 4x - 6xy^2 + 2xy^2 && \text{Commutative property} \\ &= (9 + 4)x + (-6 + 2)xy^2 && \text{Combine like terms.} \\ &= 13x - 4xy^2 && \text{Add.} \end{aligned}$$

Now Try Exercises 5 and 11 ◀

Addition and Subtraction of Polynomials

A polynomial is either a monomial or a sum (or difference) of monomials. Examples of polynomials include

$$\begin{array}{ccccccc} 5x^4z^2, & 9x^4 - 5, & 4x^2 + 5xy - y^2, & \text{and} & 4 - y^2 + 5y^4 + y^5. \\ \text{1 term} & \text{2 terms} & \text{3 terms} & & \text{4 terms} \end{array}$$

Polynomials containing one variable are called polynomials of one variable. The second and fourth polynomials shown above are examples of polynomials of one variable. The leading coefficient of a polynomial of one variable is the coefficient of the monomial with highest degree. The degree of a polynomial with one variable equals the exponent of the monomial with the highest power. Table R.2 shows several polynomials of one variable along with their degrees and leading coefficients. A polynomial of degree 1 is a *linear* polynomial, a polynomial of degree 2 is a *quadratic* polynomial, and a polynomial of degree 3 is a *cubic* polynomial.

Table R.2

Polynomial	Degree	Leading Coefficient	Type
-98	0	-98	Constant
$2x - 7$	1	2	Linear
$-5x + 9x^2 + 7$	2	9	Quadratic
$-2x^3 + 4x^2 + x - 1$	3	-2	Cubic
$7 - x + 4x^2 + x^5$	5	1	Fifth Degree

To add two polynomials, we combine like terms.

EXAMPLE 1 Adding polynomials

Simplify.

(a) $(2x^2 - 3x + 7) + (3x^2 + 4x - 2)$ (b) $(z^3 + 4z + 8) + (4z^2 - z + 6)$

SOLUTION

$$\begin{aligned} \text{(a)} \quad (2x^2 - 3x + 7) + (3x^2 + 4x - 2) &= 2x^2 + 3x^2 - 3x + 4x + 7 - 2 \\ &= (2 + 3)x^2 + (-3 + 4)x + (7 - 2) \\ &= 5x^2 + x + 5 \end{aligned}$$

$$\begin{aligned} \text{(b)} \quad (z^3 + 4z + 8) + (4z^2 - z + 6) &= z^3 + 4z^2 + 4z - z + 8 + 6 \\ &= z^3 + 4z^2 + (4 - 1)z + (8 + 6) \\ &= z^3 + 4z^2 + 3z + 14 \end{aligned}$$

Now Try Exercises 21 and 27 ◀

To subtract integers, we add the first integer and the **opposite**, or **additive inverse**, of the second integer. For example, to evaluate $3 - 5$, we perform the following operations.

$$\begin{aligned} 3 - 5 &= 3 + (-5) && \text{Add the opposite.} \\ &= -2 && \text{Simplify.} \end{aligned}$$

Similarly, to subtract two polynomials, we add the first polynomial and the opposite, or additive inverse, of the second polynomial. To find the opposite of a polynomial, we simply negate each term. Table R.3 shows three polynomials and their opposites.

Table R.3

Polynomial	Opposite
$9 - x$	$-9 + x$
$5x^2 + 4x - 1$	$-5x^2 - 4x + 1$
$-x^4 + 5x^3 - x^2 + 5x - 1$	$x^4 - 5x^3 + x^2 - 5x + 1$

EXAMPLE 4 Subtracting polynomials

Simplify.

(a) $(y^5 + 3y^3) - (-y^4 + 2y^3)$ (b) $(5x^3 + 9x^2 - 6) - (5x^3 - 4x^2 - 7)$

SOLUTION

(a) The opposite of $(-y^4 + 2y^3)$ is $(y^4 - 2y^3)$.

$$\begin{aligned} (y^5 + 3y^3) - (-y^4 + 2y^3) &= (y^5 + 3y^3) + (y^4 - 2y^3) \\ &= y^5 + y^4 + (3 - 2)y^3 \\ &= y^5 + y^4 + y^3 \end{aligned}$$

(b) The opposite of $(5x^3 - 4x^2 - 7)$ is $(-5x^3 + 4x^2 + 7)$.

$$\begin{aligned} (5x^3 + 9x^2 - 6) - (5x^3 - 4x^2 - 7) &= (5x^3 + 9x^2 - 6) + (-5x^3 + 4x^2 + 7) \\ &= (5 - 5)x^3 + (9 + 4)x^2 + (-6 + 7) \\ &= 0x^3 + 13x^2 + 1 \\ &= 13x^2 + 1 \end{aligned}$$

Now Try Exercises 39 and 41 ◀

Distributive Properties

Distributive properties are used frequently in the multiplication of polynomials. For all real numbers a , b , and c ,

$$a(b + c) = ab + ac \quad \text{and}$$

$$a(b - c) = ab - ac.$$

In the next example, we use these distributive properties to multiply expressions.

EXAMPLE 5 Using distributive properties

Multiply.

(a) $4(5 + x)$ (b) $-3(x - 4y)$ (c) $(2x - 5)(6)$

Figure R.17 Area: $20 + 4x$ **SOLUTION**

$$(a) \quad 4(5 + x) = 4 \cdot 5 + 4 \cdot x = 20 + 4x$$

$$(b) \quad -3(x - 4y) = -3 \cdot x - (-3) \cdot (4y) = -3x + 12y$$

$$(c) \quad (2x - 5)(6) = 2x \cdot 6 - 5 \cdot 6 = 12x - 30$$

Now Try Exercises 47, 51, and 53 ◀

You can visualize the solution in part (a) of Example 4 by using areas of rectangles. If a rectangle has width 4 and length $5 + x$, its area is $20 + 4x$, as shown in Figure R.17.

Multiplying Polynomials

A polynomial with two terms is a **binomial**, and one with three terms is a **trinomial**. Examples are shown in Table R.4.

Table R.4

Monomials	$2x^2$	$-3x^4$	9
Binomials	$3x - 1$	$2x^3 - x$	$x^2 + 5$
Trinomials	$x^2 - 3x + 5$	$5x^2 - 2x + 10$	$2x^3 - x^2 - 2$

In the next example, we multiply two binomials.

EXAMPLE 5 Multiplying binomials

Multiply $(x + 1)(x + 3)$.

SOLUTION To multiply $(x + 1)(x + 3)$, we apply the distributive property.

$$\begin{aligned}
 (x + 1)(x + 3) &= (x + 1)(x) + (x + 1)(3) \\
 &= x \cdot x + 1 \cdot x + x \cdot 3 + 1 \cdot 3 \\
 &= x^2 + x + 3x + 3 \\
 &= x^2 + 4x + 3
 \end{aligned}$$

Now Try Exercise 55 ◀

To multiply the binomials $(x + 1)$ and $(x + 3)$, we multiplied every term in $x + 1$ by every term in $x + 3$. That is,

$$\begin{aligned}
 (x + 1)(x + 3) &= x^2 + 3x + x + 3 \\
 &= x^2 + 4x + 3.
 \end{aligned}$$

NOTE This process of multiplying binomials is called **FOIL**. You may use the name to remind yourself to multiply the first terms (*F*), outside terms (*O*), inside terms (*I*), and last terms (*L*).

Multiply the *First terms* to obtain x^2 .

$$(x + 1)(x + 3)$$

Multiply the *Outside terms* to obtain $3x$.

$$(x + 1)(x + 3)$$

Multiply the *Inside terms* to obtain x .

$$(x + 1)(x + 3)$$

Multiply the *Last terms* to obtain 3.

$$(x + 1)(x + 3)$$

The following box summarizes how to multiply two polynomials in general.

Multiplying Polynomials

The product of two polynomials may be found by multiplying every term in the first polynomial by every term in the second polynomial and then combining like terms.

EXAMPLE 6 Multiplying binomials

Multiply each binomial.

(a) $(2x - 1)(x + 2)$ (b) $(1 - 3x)(2 - 4x)$ (c) $(x^2 + 1)(5x - 3)$

SOLUTION

$$\begin{aligned} \text{(a)} \quad (2x - 1)(x + 2) &= 2x \cdot x + 2x \cdot 2 - 1 \cdot x - 1 \cdot 2 \\ &= 2x^2 + 4x - x - 2 \\ &= 2x^2 + 3x - 2 \end{aligned}$$

$$\begin{aligned} \text{(b)} \quad (1 - 3x)(2 - 4x) &= 1 \cdot 2 - 1 \cdot 4x - 3x \cdot 2 + 3x \cdot 4x \\ &= 2 - 4x - 6x + 12x^2 \\ &= 2 - 10x + 12x^2 \end{aligned}$$

$$\begin{aligned} \text{(c)} \quad (x^2 + 1)(5x - 3) &= x^2 \cdot 5x - x^2 \cdot 3 + 1 \cdot 5x - 1 \cdot 3 \\ &= 5x^3 - 3x^2 + 5x - 3 \end{aligned}$$

Now Try Exercises 57, 59, and 77 ◀

EXAMPLE 7 Multiplying polynomials

Multiply each expression.

(a) $3x(x^2 + 5x - 4)$ (b) $-x^2(x^4 - 2x + 5)$ (c) $(x + 2)(x^2 + 4x - 3)$

SOLUTION

$$\begin{aligned} \text{(a)} \quad 3x(x^2 + 5x - 4) &= 3x \cdot x^2 + 3x \cdot 5x - 3x \cdot 4 \\ &= 3x^3 + 15x^2 - 12x \end{aligned}$$

$$\begin{aligned} \text{(b)} \quad -x^2(x^4 - 2x + 5) &= -x^2 \cdot x^4 + x^2 \cdot 2x - x^2 \cdot 5 \\ &= -x^6 + 2x^3 - 5x^2 \end{aligned}$$

$$\begin{aligned} \text{(c)} \quad (x + 2)(x^2 + 4x - 3) &= x \cdot x^2 + x \cdot 4x - x \cdot 3 + 2 \cdot x^2 + 2 \cdot 4x - 2 \cdot 3 \\ &= x^3 + 4x^2 - 3x + 2x^2 + 8x - 6 \\ &= x^3 + 6x^2 + 5x - 6 \end{aligned}$$

Now Try Exercises 67, 69, and 73 ◀

Some Special Products

The following special product often occurs in mathematics.

$$\begin{aligned} (a - b)(a + b) &= a \cdot a + a \cdot b - b \cdot a - b \cdot b \\ &= a^2 + ab - ba - b^2 \\ &= a^2 - b^2 \end{aligned}$$

That is, the product of a sum of two numbers and their difference equals the difference of their squares.

EXAMPLE 3 Finding the product of a sum and difference

Multiply.

(a) $(x - 3)(x + 3)$ (b) $(5 + 4x^2)(5 - 4x^2)$

SOLUTION(a) If we let $a = x$ and $b = 3$, we can apply $(a - b)(a + b) = a^2 - b^2$. Thus

$$\begin{aligned}(x - 3)(x + 3) &= (x)^2 - (3)^2 \\ &= x^2 - 9.\end{aligned}$$

(b) Similarly,

$$\begin{aligned}(5 + 4x^2)(5 - 4x^2) &= (5)^2 - (4x^2)^2 \\ &= 25 - 16x^4.\end{aligned}$$

Now Try Exercises 79 and 95 ◀

Two other special products involve *squaring a binomial*:

$$\begin{aligned}(a + b)^2 &= (a + b)(a + b) \\ &= a^2 + ab + ba + b^2 \\ &= a^2 + 2ab + b^2\end{aligned}$$

and

$$\begin{aligned}(a - b)^2 &= (a - b)(a - b) \\ &= a^2 - ab - ba + b^2 \\ &= a^2 - 2ab + b^2.\end{aligned}$$

Note that to obtain the middle term, we multiply the two terms in the binomial and double the result.

EXAMPLE 4 Squaring a binomial

Multiply.

(a) $(x + 5)^2$ (b) $(3 - 2x)^2$

SOLUTION(a) If we let $a = x$ and $b = 5$, we can apply $(a + b)^2 = a^2 + 2ab + b^2$. Thus

$$\begin{aligned}(x + 5)^2 &= (x)^2 + 2(x)(5) + (5)^2 \\ &= x^2 + 10x + 25.\end{aligned}$$

(b) Applying the formula $(a - b)^2 = a^2 - 2ab + b^2$, we find

$$\begin{aligned}(3 - 2x)^2 &= (3)^2 - 2(3)(2x) + (2x)^2 \\ &= 9 - 12x + 4x^2.\end{aligned}$$

Now Try Exercises 85 and 91 ◀

R.4 Factoring Polynomials

- Use common factors
- Factor by grouping
- Factor $x^2 + bx + c$
- Factor trinomials by grouping
- Factor trinomials with FOIL
- Factor the difference of two squares
- Factor perfect square trinomials
- Factor the sum and difference of two cubes

Common Factors

When factoring a polynomial, we first look for factors that are common to each term in an expression. By applying a distributive property, we can write a polynomial as two factors. For example, each term in $2x^2 + 4x$ contains a factor of $2x$.

$$2x^2 = 2x \cdot x$$

$$4x = 2x \cdot 2$$

Thus the polynomial $2x^2 + 4x$ can be factored as follows.

$$2x^2 + 4x = 2x(x + 2)$$

EXAMPLE 1 Finding common factors

Factor.

(a) $6z^3 - 2z^2 + 4z$ (b) $4x^3y^2 + x^2y^3$

SOLUTION

(a) Each of the terms $6z^3$, $2z^2$, and $4z$ contains a common factor of $2z$. That is,

$$6z^3 = 2z \cdot 3z^2, \quad 2z^2 = 2z \cdot z, \quad \text{and} \quad 4z = 2z \cdot 2.$$

$$\text{Thus } 6z^3 - 2z^2 + 4z = 2z(3z^2 - z + 2).$$

(b) Both $4x^3y^2$ and x^2y^3 contain a common factor of x^2y^2 . That is,

$$4x^3y^2 = x^2y^2 \cdot 4x \quad \text{and} \quad x^2y^3 = x^2y^2 \cdot y.$$

$$\text{Thus } 4x^3y^2 + x^2y^3 = x^2y^2(4x + y).$$

Many times we factor out the *greatest common factor*. For example, the polynomial $15x^4 - 5x^2$ has a common factor of $5x$. We could write this polynomial as

$$15x^4 - 5x^2 = 5x(3x^3 - x).$$

However, we can also factor out $5x^2$ to obtain

$$15x^4 - 5x^2 = 5x^2(3x^2 - 1).$$

Because $5x^2$ is the common factor with the highest degree and largest coefficient, we say that $5x^2$ is the **greatest common factor** (GCF) of $15x^4 - 5x^2$.

EXAMPLE 2 Factoring greatest common factors

Factor.

(a) $6m^3n^2 - 3mn^2 + 9m$ (b) $-9x^4 + 6x^3 - 3x^2$

SOLUTION

(a) The GCF of $6m^3n^2$, $3mn^2$, and $9m$ is $3m$.

$$6m^3n^2 = 3m \cdot 2m^2n^2, \quad 3mn^2 = 3m \cdot n^2, \quad \text{and} \quad 9m = 3m \cdot 3$$

$$\text{Thus } 6m^3n^2 - 3mn^2 + 9m = 3m(2m^2n^2 - n^2 + 3).$$

(b) Rather than factoring out $3x^2$, we can factor out $-3x^2$ and make the leading coefficient of the remaining expression positive.

$$-9x^4 = -3x^2 \cdot 3x^2, \quad 6x^3 = -3x^2 \cdot -2x, \quad \text{and} \quad -3x^2 = -3x^2 \cdot 1$$

$$\text{Thus } -9x^4 + 6x^3 - 3x^2 = -3x^2(3x^2 - 2x + 1). \quad \text{Now Try Exercises 11 and 17} \quad \blacktriangleleft$$

Factoring by Grouping

Factoring by grouping is a technique that makes use of the associative and distributive properties. The next example illustrates the first step in this factoring technique.

Consider the polynomial

$$3t^3 + 6t^2 + 2t + 4.$$

We can factor this polynomial by first grouping it into two binomials.

$$(3t^3 + 6t^2) + (2t + 4) \quad \text{Associative property}$$

$$3t^2(t + 2) + 2(t + 2) \quad \text{Factor out common factors.}$$

$$(3t^2 + 2)(t + 2). \quad \text{Factor out } (t + 2).$$

The following steps summarize factoring four terms by grouping.

Factoring by Grouping

- STEP 1:** Use parentheses to group the terms into binomials with common factors. Begin by writing the expression with a plus sign between the binomials.
- STEP 2:** Factor out the common factor in each binomial.
- STEP 3:** Factor out the common binomial. If there is no common binomial, try a different grouping or a different method of factoring.

EXAMPLE 3 Factoring by grouping

Factor each polynomial.

(a) $12x^3 - 9x^2 - 8x + 6$ (b) $2x - 2y + ax - ay$

SOLUTION

$$\begin{aligned}
 \text{(a)} \quad 12x^3 - 9x^2 - 8x + 6 &= (12x^3 - 9x^2) + (-8x + 6) \\
 &= 3x^2(4x - 3) - 2(4x - 3) \\
 &= (3x^2 - 2)(4x - 3)
 \end{aligned}$$

$$\begin{aligned}
 \text{(b)} \quad 2x - 2y + ax - ay &= (2x - 2y) + (ax - ay) \\
 &= 2(x - y) + a(x - y) \\
 &= (2 + a)(x - y)
 \end{aligned}$$

Write with a plus sign between binomials.

Factor out $3x^2$ and -2 .Factor out $4x - 3$.

Group terms.

Factor out 2 and a .

Now Try Exercises 21 and 31

Factoring $x^2 + bx + c$ The product $(x + 3)(x + 4)$ can be found as follows.

$$\begin{aligned}
 (x + 3)(x + 4) &= x^2 + 4x + 3x + 12 \\
 &= x^2 + 7x + 12
 \end{aligned}$$

The middle term $7x$ is found by calculating the sum $4x + 3x$, and the last term is found by calculating the product $3 \cdot 4 = 12$.When we factor polynomials, we are *reversing* the process of multiplication. To factor $x^2 + 7x + 12$, we must find m and n that satisfy

$$x^2 + 7x + 12 = (x + m)(x + n).$$

Because

$$(x + m)(x + n) = x^2 + (m + n)x + mn,$$

it follows that $mn = 12$ and $m + n = 7$. To determine m and n , we list factors of 12 and their sum, as shown in Table R.5.Because $3 \cdot 4 = 12$ and $3 + 4 = 7$, we can write the factored form as

$$x^2 + 7x + 12 = (x + 3)(x + 4).$$

This result can always be checked by multiplying the two binomials.

$$(x + 3)(x + 4) = x^2 + 7x + 12$$

$$\begin{array}{r}
 + 3x \\
 + 4x \\
 \hline
 + 7x
 \end{array}$$

The middle term checks.

Table R.5 Factor Pairs for 12

Factors	1, 12	2, 6	3, 4
Sum	13	8	7

Factoring $x^2 + bx + c$ To factor the trinomial $x^2 + bx + c$, find integers m and n that satisfy

$$m \cdot n = c \quad \text{and} \quad m + n = b.$$

Then $x^2 + bx + c = (x + m)(x + n)$.**EXAMPLE 4** Factoring the form $x^2 + bx + c$

Factor each trinomial.

(a) $x^2 + 10x + 16$ (b) $x^2 + 7x - 30$

Table R.6 Factor Pairs for 16

Factors	1, 16	2, 8	4, 4
Sum	17	10	8

SOLUTION

- (a) We need to find a factor pair for 16 whose sum is 10. From Table R.6 the required factor pair is $m = 2$ and $n = 8$. Thus

$$x^2 + 10x + 16 = (x + 2)(x + 8).$$

- (b) Factors of -30 whose sum equals 7 are -3 and 10 . Thus

$$x^2 + 7x - 30 = (x - 3)(x + 10).$$

Now Try Exercises 33 and 37 ◀

EXAMPLE 3 Removing common factors first

Factor completely.

- (a) $3x^2 + 15x + 18$ (b) $5x^3 + 5x^2 - 60x$

SOLUTION

- (a) If we first factor out the common factor of 3, the resulting trinomial is easier to factor.

$$3x^2 + 15x + 18 = 3(x^2 + 5x + 6)$$

Now we find m and n such that $mn = 6$ and $m + n = 5$. These numbers are 2 and 3.

$$\begin{aligned} 3x^2 + 15x + 18 &= 3(x^2 + 5x + 6) \\ &= 3(x + 2)(x + 3) \end{aligned}$$

- (b) First, we factor out the common factor of $5x$. Then we factor the resulting trinomial.

$$\begin{aligned} 5x^3 + 5x^2 - 60x &= 5x(x^2 + x - 12) \\ &= 5x(x - 3)(x + 4) \end{aligned}$$

Now Try Exercises 51 and 53 ◀

Factoring Trinomials by Grouping

In this subsection we use grouping to factor trinomials in the form $ax^2 + bx + c$ with $a \neq 1$. For example, one way to factor $3x^2 + 14x + 8$ is to find two numbers m and n such that $mn = 3 \cdot 8 = 24$ and $m + n = 14$. Because $2 \cdot 12 = 24$ and $2 + 12 = 14$, $m = 2$ and $n = 12$. Using grouping, we can now factor this trinomial.

$$\begin{aligned} 3x^2 + 14x + 8 &= 3x^2 + 2x + 12x + 8 && \text{Write } 14x \text{ as } 2x + 12x. \\ &= (3x^2 + 2x) + (12x + 8) && \text{Associative property} \\ &= x(3x + 2) + 4(3x + 2) && \text{Factor out } x \text{ and } 4. \\ &= (x + 4)(3x + 2) && \text{Distributive property} \end{aligned}$$

Writing the polynomial as $3x^2 + 12x + 2x + 8$ would also work.

Factoring $ax^2 + bx + c$ by Grouping

To factor $ax^2 + bx + c$, perform the following steps. (Assume that a , b , and c have no factor in common.)

1. Find numbers m and n such that $mn = ac$ and $m + n = b$. This step may require trial and error.
2. Write the trinomial as $ax^2 + mx + nx + c$.
3. Use grouping to factor this expression as two binomials.

EXAMPLE 6 Factoring $ax^2 + bx + c$ by grouping

Factor each trinomial.

(a) $12y^2 + 5y - 3$ (b) $6r^2 - 19r + 10$

SOLUTION

- (a) In this trinomial $a = 12$, $b = 5$, and $c = -3$. Because $mn = ac$ and $m + n = b$, the numbers m and n satisfy $mn = -36$ and $m + n = 5$. Thus $m = 9$ and $n = -4$.

$$\begin{aligned}
 12y^2 + 5y - 3 &= 12y^2 + 9y - 4y - 3 && \text{Write } 5y \text{ as } 9y - 4y. \\
 &= (12y^2 + 9y) + (-4y - 3) && \text{Associative property} \\
 &= 3y(4y + 3) - 1(4y + 3) && \text{Factor out } 3y \text{ and } -1. \\
 &= (3y - 1)(4y + 3) && \text{Distributive property}
 \end{aligned}$$

- (b) In this trinomial $a = 6$, $b = -19$, and $c = 10$. Because $mn = ac$ and $m + n = b$, the numbers m and n satisfy $mn = 60$ and $m + n = -19$. Thus $m = -4$ and $n = -15$.

$$\begin{aligned}
 6r^2 - 19r + 10 &= 6r^2 - 4r - 15r + 10 && \text{Write } -19r \text{ as } -4r - 15r. \\
 &= (6r^2 - 4r) + (-15r + 10) && \text{Associative property} \\
 &= 2r(3r - 2) - 5(3r - 2) && \text{Factor out } 2r \text{ and } -5. \\
 &= (2r - 5)(3r - 2) && \text{Distributive property}
 \end{aligned}$$

Now Try Exercises 41 and 43 ◀**Factoring Trinomials with FOIL**

An alternative to factoring trinomials by grouping is to use FOIL in *reverse*. For example, the factors of $3x^2 + 7x + 2$ are two binomials.

$$3x^2 + 7x + 2 \stackrel{?}{=} (\underline{\quad} + \underline{\quad})(\underline{\quad} + \underline{\quad})$$

The expressions to be placed in the four blanks are yet to be found. By the FOIL method, we know that the product of the first terms is $3x^2$. Because $3x^2 = 3x \cdot x$, we can write

$$3x^2 + 7x + 2 \stackrel{?}{=} (\underline{3x} + \underline{\quad})(\underline{x} + \underline{\quad}).$$

The product of the last terms in each binomial must equal 2. Because $2 = 1 \cdot 2$, we can put the 1 and 2 in the blanks, but we must be sure to place them correctly so that the product of the *outside terms* plus the product of the *inside terms* equals $7x$.

$$\begin{array}{c}
 (3x + 1)(x + 2) = 3x^2 + 7x + 2 \\
 \begin{array}{ccc}
 \downarrow & \downarrow & \downarrow \\
 3x & + & 1 \\
 \downarrow & \downarrow & \downarrow \\
 3x^2 & + & 2x \\
 + & & \\
 + & 6x & + \\
 \hline
 & 7x &
 \end{array}
 \end{array}$$

← Middle term checks.

If we had interchanged the 1 and 2, we would have obtained an incorrect result.

$$\begin{array}{c}
 (3x + 2)(x + 1) = 3x^2 + 5x + 2 \\
 \begin{array}{ccc}
 \downarrow & \downarrow & \downarrow \\
 3x & + & 2 \\
 \downarrow & \downarrow & \downarrow \\
 3x^2 & + & 3x \\
 + & & \\
 + & 2x & + \\
 \hline
 & 5x &
 \end{array}
 \end{array}$$

← Middle term is *not* $7x$.

In the next example, we factor expressions of the form $ax^2 + bx + c$, where $a \neq 1$. In this situation, we may need to *guess and check* or use *trial and error* a few times to find the correct factors.

EXAMPLE 7 Factoring the form $ax^2 + bx + c$

Factor each trinomial.

(a) $6x^2 - x - 2$ (b) $4x^3 - 14x^2 + 6x$

SOLUTION

- (a) The factors of $6x^2$ are either $2x$ and $3x$ or $6x$ and x . The factors of -2 are either -1 and 2 or 1 and -2 . To obtain a middle term of $-x$, we use the following factors.

$$\begin{array}{rcccl} (3x - 2) & (2x + 1) & = & 6x^2 - x - 2 & \\ \left[\begin{array}{c} -4x \\ +3x \\ -x \end{array} \right] & & & & \uparrow \\ & & & & \text{It checks.} \end{array}$$

To find the correct factorization, we may need to guess and check a few times.

- (b) Each term contains a common factor of $2x$, so we do the following step first.

$$4x^3 - 14x^2 + 6x = 2x(2x^2 - 7x + 3)$$

Next we factor $2x^2 - 7x + 3$. The factors of $2x^2$ are $2x$ and x . Because the middle term is negative, we use -1 and -3 for factors of 3 .

$$\begin{aligned} 4x^3 - 14x^2 + 6x &= 2x(2x^2 - 7x + 3) \\ &= 2x(2x - 1)(x - 3) \end{aligned}$$

Now Try Exercises 55 and 57

Difference of Two Squares

When we factor polynomials, we are *reversing* the process of multiplying polynomials. In Section R.3 we discussed the equation

$$(a - b)(a + b) = a^2 - b^2.$$

We can use this equation to factor a difference of two squares.

Difference of Two Squares

For any real numbers a and b ,

$$a^2 - b^2 = (a - b)(a + b).$$

NOTE The sum of two squares *cannot* be factored (using real numbers). For example, $x^2 + y^2$ cannot be factored, whereas $x^2 - y^2$ can be factored. It is important to remember that $x^2 + y^2 \neq (x + y)^2$.

EXAMPLE 8 Factoring the difference of two squares

Factor each polynomial, if possible.

(a) $9x^2 - 64$ (b) $4x^2 + 9y^2$ (c) $4a^3 - 4a$

SOLUTION

- (a) Note that $9x^2 = (3x)^2$ and $64 = 8^2$.

$$\begin{aligned} 9x^2 - 64 &= (3x)^2 - (8)^2 \\ &= (3x - 8)(3x + 8) \end{aligned}$$

- (b) Because $4x^2 + 9y^2$ is the *sum* of two squares, it *cannot* be factored.
 (c) Start by factoring out the common factor of $4a$.

$$\begin{aligned} 4a^3 - 4a &= 4a(a^2 - 1) \\ &= 4a(a - 1)(a + 1) \end{aligned}$$

Now Try Exercises 61, 65, and 69

EXAMPLE 9 Applying the difference of two squares

Factor each expression.

(a) $x^4 - y^4$ (b) $6r^2 - 24t^4$

SOLUTION

(a) Use $a^2 - b^2 = (a - b)(a + b)$, with $a = x^2$ and $b = y^2$.

$$\begin{aligned} x^4 - y^4 &= (x^2)^2 - (y^2)^2 && \text{Write as squares.} \\ &= (x^2 - y^2)(x^2 + y^2) && \text{Difference of squares} \\ &= (x - y)(x + y)(x^2 + y^2) && \text{Difference of squares} \end{aligned}$$

(b) Start by factoring out the common factor of 6.

$$\begin{aligned} 6r^2 - 24t^4 &= 6(r^2 - 4t^4) && \text{Factor out 6.} \\ &= 6(r^2 - (2t^2)^2) && \text{Write as squares.} \\ &= 6(r - 2t^2)(r + 2t^2) && \text{Difference of squares} \end{aligned}$$

Now Try Exercises 66 and 67

Perfect Square Trinomials

In Section R.3 we expanded $(a + b)^2$ and $(a - b)^2$ as follows.

$$(a + b)^2 = a^2 + 2ab + b^2 \quad \text{and} \quad (a - b)^2 = a^2 - 2ab + b^2$$

The expressions $a^2 + 2ab + b^2$ and $a^2 - 2ab + b^2$ are called **perfect square trinomials**. We can use the following formulas to factor them.

Perfect Square Trinomials

For any real numbers a and b ,

$$\begin{aligned} a^2 + 2ab + b^2 &= (a + b)^2 \quad \text{and} \\ a^2 - 2ab + b^2 &= (a - b)^2. \end{aligned}$$

EXAMPLE 10 Factoring perfect square trinomials

Factor each expression.

(a) $x^2 + 6x + 9$ (b) $81x^2 - 72x + 16$

SOLUTION

(a) Let $a^2 = x^2$ and $b^2 = 3^2$. In a perfect square trinomial, the middle term is $2ab$.

$$2ab = 2(x)(3) = 6x,$$

which equals the given middle term. Thus $a^2 + 2ab + b^2 = (a + b)^2$ implies

$$x^2 + 6x + 9 = (x + 3)^2.$$

(b) Let $a^2 = (9x)^2$ and $b^2 = 4^2$. In a perfect square trinomial, the middle term is $2ab$.

$$2ab = 2(9x)(4) = 72x,$$

which equals the given middle term. Thus $a^2 - 2ab + b^2 = (a - b)^2$ implies

$$81x^2 - 72x + 16 = (9x - 4)^2.$$

Now Try Exercises 77 and 81

EXAMPLE 11 Factoring perfect square trinomials

Factor $25a^3 + 10a^2b + ab^2$.

SOLUTION Start by factoring out the common factor of a . Then factor the resulting perfect square trinomial.

$$\begin{aligned} 25a^3 + 10a^2b + ab^2 &= a(25a^2 + 10ab + b^2) \\ &= a(5a + b)^2 \end{aligned}$$

Now Try Exercise 89

Sum and Difference of Two Cubes

The sum or difference of two cubes may be factored. This fact is justified by the following two equations.

$$\begin{aligned} (a + b)(a^2 - ab + b^2) &= a^3 + b^3 \quad \text{and} \\ (a - b)(a^2 + ab + b^2) &= a^3 - b^3 \end{aligned}$$

These equations can be verified by multiplying the left side to obtain the right side. For example,

$$\begin{aligned} (a + b)(a^2 - ab + b^2) &= a \cdot a^2 - a \cdot ab + a \cdot b^2 + b \cdot a^2 - b \cdot ab + b \cdot b^2 \\ &= a^3 - a^2b + ab^2 + a^2b - ab^2 + b^3 \\ &= a^3 + b^3. \end{aligned}$$

Sum and Difference of Two Cubes

For any real numbers a and b ,

$$\begin{aligned} a^3 + b^3 &= (a + b)(a^2 - ab + b^2) \quad \text{and} \\ a^3 - b^3 &= (a - b)(a^2 + ab + b^2). \end{aligned}$$

EXAMPLE 12 Factoring the sum and difference of two cubes

Factor each polynomial.

(a) $x^3 + 8$ (b) $27x^3 - 64y^3$ (c) $27p^9 - 8q^6$

SOLUTION

(a) Because $x^3 = (x)^3$ and $8 = 2^3$, we let $a = x$, $b = 2$ and factor. Substituting in

$$a^3 + b^3 = (a + b)(a^2 - ab + b^2)$$

gives

$$x^3 + 2^3 = (x + 2)(x^2 - x \cdot 2 + 2^2)$$

$$= (x + 2)(x^2 - 2x + 4).$$

Note that the quadratic expression does not factor further.

(b) Here, $27x^3 = (3x)^3$ and $64y^3 = (4y)^3$, so

$$27x^3 - 64y^3 = (3x)^3 - (4y)^3.$$

Substituting $a = 3x$ and $b = 4y$ in

$$a^3 - b^3 = (a - b)(a^2 + ab + b^2)$$

gives

$$(3x)^3 - (4y)^3 = (3x - 4y)((3x)^2 + 3x \cdot 4y + (4y)^2)$$

$$= (3x - 4y)(9x^2 + 12xy + 16y^2).$$

(c) Let $a^3 = (3p^3)^3$ and $b^3 = (2q^2)^3$. Then $a^3 - b^3 = (a - b)(a^2 + ab + b^2)$ implies

$$27p^9 - 8q^6 = (3p^3 - 2q^2)(9p^6 + 6p^3q^2 + 4q^4).$$

Now Try Exercises 93, 95, and 99 ◀

R.5 Rational Expressions

- Simplify rational expressions
- Multiply and divide fractions
- Perform multiplication and division on rational expressions
- Find least common multiples and denominators
- Add and subtract fractions
- Perform addition and subtraction on rational expressions
- Clear fractions from equations
- Simplify complex fractions

Simplifying Rational Expressions

When simplifying fractions, we sometimes use the **basic principle of fractions**, which states that

$$\frac{a \cdot c}{b \cdot c} = \frac{a}{b}.$$

This principle holds because $\frac{c}{c} = 1$ and $\frac{a}{b} \cdot 1 = \frac{a}{b}$. It can be used to simplify a fraction.

$$\frac{6}{44} = \frac{3 \cdot 2}{22 \cdot 2} = \frac{3}{22}$$

This same principle can also be used to simplify rational expressions.

Simplifying Rational Expressions

The following principle can be used to simplify rational expressions, where A , B , and C are polynomials.

$$\frac{A \cdot C}{B \cdot C} = \frac{A}{B}, \quad B \text{ and } C \text{ are nonzero.}$$

EXAMPLE 1 Simplifying rational expressions

Simplify each expression.

$$(a) \frac{9x}{3x^2} \quad (b) \frac{2z^2 - 3z - 9}{z^2 + 2z - 15} \quad (c) \frac{a^2 - b^2}{a + b}$$

SOLUTION

(a) First factor out the greatest common factor, $3x$, in the numerator and denominator.

$$\frac{9x}{3x^2} = \frac{3 \cdot 3x}{x \cdot 3x} = \frac{3}{x}$$

(b) Start by factoring the numerator and denominator.

$$\frac{2z^2 - 3z - 9}{z^2 + 2z - 15} = \frac{(2z + 3)(z - 3)}{(z + 5)(z - 3)} = \frac{2z + 3}{z + 5}$$

(c) Start by factoring the numerator as the difference of squares.

$$\frac{a^2 - b^2}{a + b} = \frac{(a - b)(a + b)}{a + b} = a - b$$

Now Try Exercises 1, 5, and 11

Review of Multiplication and Division of Fractions

Recall that to multiply two fractions we use the property

$$\frac{a}{b} \cdot \frac{c}{d} = \frac{ac}{bd}$$

For example, $\frac{2}{5} \cdot \frac{3}{7} = \frac{2 \cdot 3}{5 \cdot 7} = \frac{6}{35}$.

EXAMPLE 2 Multiplying fractions

Multiply and simplify the product.

$$(a) \frac{4}{9} \cdot \frac{3}{8} \quad (b) \frac{2}{3} \cdot \frac{3}{4} \cdot \frac{5}{6}$$

SOLUTION

$$(a) \frac{4}{9} \cdot \frac{3}{8} = \frac{4 \cdot 3}{9 \cdot 8} = \frac{12}{72} = \frac{1 \cdot 12}{6 \cdot 12} = \frac{1}{6} \quad (b) \frac{2}{3} \cdot \frac{3}{4} \cdot \frac{5}{6} = \frac{6 \cdot 5}{12 \cdot 6} = \frac{5}{12}$$

Now Try Exercises 15 and 17

Recall that to divide two fractions we “invert and multiply.” That is, we change a division problem to a multiplication problem, using the property

$$\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \cdot \frac{d}{c}$$

For example, $\frac{3}{4} \div \frac{5}{4} = \frac{3}{4} \cdot \frac{4}{5} = \frac{3 \cdot 4}{5 \cdot 4} = \frac{3}{5}$.

Multiplication and Division of Rational Expressions

Multiplying and dividing rational expressions is similar to multiplying and dividing fractions.

Products and Quotients of Rational Expressions

To multiply two rational expressions, multiply numerators and multiply denominators.

$$\frac{A}{B} \cdot \frac{C}{D} = \frac{AC}{BD}, \quad B \text{ and } D \text{ are nonzero.}$$

To divide two rational expressions, multiply by the reciprocal of the divisor.

$$\frac{A}{B} \div \frac{C}{D} = \frac{A}{B} \cdot \frac{D}{C}, \quad B, C, \text{ and } D \text{ are nonzero.}$$

EXAMPLE 3 Multiplying rational expressions

Multiply.

$$(a) \frac{1}{x} \cdot \frac{2x}{x+1} \quad (b) \frac{x-1}{x} \cdot \frac{x-1}{x+2}$$

SOLUTION

$$(a) \frac{1}{x} \cdot \frac{2x}{x+1} = \frac{1 \cdot 2x}{x(x+1)} = \frac{2}{x+1} \quad (b) \frac{x-1}{x} \cdot \frac{x-1}{x+2} = \frac{(x-1)(x-1)}{x(x+2)}$$

Now Try Exercises 33 and 37 ◀

EXAMPLE 4 Dividing two rational expressions

Divide and simplify.

$$(a) \frac{2}{x} \div \frac{2x-1}{4x} \quad (b) \frac{x^2-1}{x^2+x-6} \div \frac{x-1}{x+3}$$

SOLUTION

$$(a) \frac{2}{x} \div \frac{2x-1}{4x} = \frac{2}{x} \cdot \frac{4x}{2x-1} \quad \text{Invert and multiply}$$

$$= \frac{8x}{x(2x-1)} \quad \text{Simplify}$$

$$= \frac{8}{2x-1}$$

$$(b) \frac{x^2-1}{x^2+x-6} \div \frac{x-1}{x+3} = \frac{x^2-1}{x^2+x-6} \cdot \frac{x+3}{x-1}$$

$$= \frac{(x+1)(x-1)}{(x-2)(x+3)} \cdot \frac{x+3}{x-1}$$

$$= \frac{(x+1)(x-1)(x+3)}{(x-2)(x-1)(x+3)}$$

$$= \frac{x+1}{x-2}$$

Now Try Exercises 45 and 53 ◀

Least Common Multiples and Denominators

To add or subtract fractions and rational expressions, we need to find a common denominator. The **least common denominator** (LCD) is equivalent to the **least common multiple** (LCM) of the denominators. The following procedure can be used to find the least common multiple.

Finding the Least Common Multiple

The least common multiple (LCM) of two polynomials can be found as follows.

STEP 1: Factor each polynomial completely.

STEP 2: List each factor the greatest number of times that it occurs in either factorization.

STEP 3: Find the product of this list of factors. The result is the LCM.

The next example illustrates how to use this procedure.

EXAMPLE 5 Finding least common multiples

Find the least common multiple for each pair of expressions.

$$(a) 4x, 5x^3 \quad (b) x^2 + 4x + 4, x^2 + 3x + 2$$

SOLUTION**(a) STEP 1:** Factor each polynomial completely.

$$4x = 2 \cdot 2 \cdot x \quad \text{and} \quad 5x^3 = 5 \cdot x \cdot x \cdot x$$

STEP 2: The factor 2 occurs twice, the factor 5 occurs once, and the factor x occurs at most three times. The list then is 2, 2, 5, x , x , and x .**STEP 3:** The LCM is the product $2 \cdot 2 \cdot 5 \cdot x \cdot x \cdot x$, or $20x^3$.**(b) STEP 1:** Factor each polynomial as follows.

$$x^2 + 4x + 4 = (x + 2)(x + 2) \quad \text{and} \quad x^2 + 3x + 2 = (x + 1)(x + 2)$$

STEP 2: The factor $(x + 1)$ occurs once, and $(x + 2)$ occurs at most twice.**STEP 3:** The LCM is the product $(x + 1)(x + 2)^2$, which is left in factored form.

Now Try Exercises 61 and 65

EXAMPLE 6 Finding a least common denominatorFind the LCD for the expressions $\frac{1}{x^2 + 4x + 4}$ and $\frac{5}{x^2 + 3x + 2}$.**SOLUTION** From Example 5(b), the LCM for $x^2 + 4x + 4$ and $x^2 + 3x + 2$ is

$$(x + 1)(x + 2)^2.$$

Therefore the LCD is *also* $(x + 1)(x + 2)^2$.

Now Try Exercise 69

Review of Addition and Subtraction of Fractions

Recall that to add two fractions we use the property $\frac{a}{c} + \frac{b}{c} = \frac{a+b}{c}$. This property requires *like* denominators. For example, $\frac{1}{5} + \frac{3}{5} = \frac{1+3}{5} = \frac{4}{5}$. When the denominators are not alike, we must find a common denominator. Before adding two fractions, such as $\frac{2}{3}$ and $\frac{1}{4}$, we write them with 12 as their common denominator. That is, we multiply each fraction by 1 written in an appropriate form. For example, to write $\frac{2}{3}$ with a denominator of 12, we multiply $\frac{2}{3}$ by 1, written as $\frac{4}{4}$.

$$\frac{2}{3} = \frac{2}{3} \cdot \frac{4}{4} = \frac{8}{12} \quad \text{and} \quad \frac{1}{4} = \frac{1}{4} \cdot \frac{3}{3} = \frac{3}{12}$$

Once the fractions have a common denominator, we can add them, as in

$$\frac{2}{3} + \frac{1}{4} = \frac{8}{12} + \frac{3}{12} = \frac{11}{12}.$$

The *least common denominator* (LCD) for $\frac{2}{3}$ and $\frac{1}{4}$ is equal to the *least common multiple* (LCM) of 3 and 4. Thus the least common denominator is 12.

EXAMPLE 7 Adding fractionsSimplify $\frac{3}{5} + \frac{2}{7}$.**SOLUTION** The LCD is 35.

$$\frac{3}{5} + \frac{2}{7} = \frac{3}{5} \cdot \frac{7}{7} + \frac{2}{7} \cdot \frac{5}{5} = \frac{21}{35} + \frac{10}{35} = \frac{31}{35}$$

Now Try Exercise 27

Recall that subtraction is similar to addition. To subtract two fractions with *like* denominators, we use the property $\frac{a}{c} - \frac{b}{c} = \frac{a-b}{c}$. For example, $\frac{3}{11} - \frac{7}{11} = \frac{3-7}{11} = -\frac{4}{11}$.

EXAMPLE 8 Subtracting fractions

Simplify $\frac{3}{8} - \frac{5}{6}$.

SOLUTION The LCD is 24.

$$\frac{3}{8} - \frac{5}{6} = \frac{3}{8} \cdot \frac{3}{3} - \frac{5}{6} \cdot \frac{4}{4} = \frac{9}{24} - \frac{20}{24} = -\frac{11}{24}$$

Now Try Exercise 29 ◀

Addition and Subtraction of Rational Expressions

Addition and subtraction of rational expressions with like denominators are performed in the following manner.

Sums and Differences of Rational Expressions

To add (or subtract) two rational expressions with like denominators, add (or subtract) their numerators. The denominator does not change.

$$\frac{A}{C} + \frac{B}{C} = \frac{A+B}{C}$$

$$\frac{A}{C} - \frac{B}{C} = \frac{A-B}{C}, \quad C \neq 0$$

NOTE If the denominators are not alike, begin by writing each rational expression, using a common denominator. The LCD equals the LCM of the denominators.

EXAMPLE 9 Adding rational expressions

Add and simplify.

$$(a) \frac{x}{x+2} + \frac{3x+1}{x+2} \quad (b) \frac{1}{x-1} + \frac{2x}{x+1}$$

SOLUTION

(a) The denominators are alike, so we add the numerators and keep the same denominator.

$$\begin{aligned} \frac{x}{x+2} + \frac{3x+1}{x+2} &= \frac{x+3x+1}{x+2} && \text{Add numerators.} \\ &= \frac{4x+1}{x+2} && \text{Combine like terms.} \end{aligned}$$

(b) The LCM for $x - 1$ and $x + 1$ is their product, $(x - 1)(x + 1)$.

$$\begin{aligned}
 \frac{1}{x-1} + \frac{2x}{x+1} &= \frac{1}{x-1} \cdot \frac{x+1}{x+1} + \frac{2x}{x+1} \cdot \frac{x-1}{x-1} && \text{Change to a common denominator.} \\
 &= \frac{x+1}{(x-1)(x+1)} + \frac{2x(x-1)}{(x+1)(x-1)} && \text{Multiply.} \\
 &= \frac{x+1+2x^2-2x}{(x-1)(x+1)} && \text{Add numerators; distributive property} \\
 &= \frac{2x^2-x+1}{(x-1)(x+1)} && \text{Combine like terms.}
 \end{aligned}$$

Now Try Exercises 73 and 81

Subtraction of rational expressions is similar.

EXAMPLE 10 Subtracting rational expressions

Subtract and simplify the expression $\frac{x-1}{x} - \frac{5}{x+5}$.

SOLUTION The LCD is $x(x+5)$.

$$\begin{aligned}
 \frac{x-1}{x} - \frac{5}{x+5} &= \frac{x-1}{x} \cdot \frac{x+5}{x+5} - \frac{5}{x+5} \cdot \frac{x}{x} && \text{Change to a common denominator.} \\
 &= \frac{(x-1)(x+5)}{x(x+5)} - \frac{5x}{x(x+5)} && \text{Multiply.} \\
 &= \frac{(x-1)(x+5) - 5x}{x(x+5)} && \text{Subtract numerators.} \\
 &= \frac{x^2 + 4x - 5 - 5x}{x(x+5)} && \text{Multiply binomials.} \\
 &= \frac{x^2 - x - 5}{x(x+5)} && \text{Combine like terms.}
 \end{aligned}$$

Now Try Exercise 79

Clearing Fractions

To solve rational equations, it is sometimes advantageous to multiply each side by the LCD to clear fractions. For example, the LCD for the equation $\frac{1}{x+2} + \frac{1}{x-2} = 0$ is $(x+2)(x-2)$. Multiplying each side by the LCD results in the following.

$$\begin{aligned}
 (x+2)(x-2) \left(\frac{1}{x+2} + \frac{1}{x-2} \right) &= 0 && \text{Multiply by LCD.} \\
 \frac{(x+2)(x-2)}{x+2} + \frac{(x+2)(x-2)}{x-2} &= 0 && \text{Distributive property} \\
 (x-2) + (x+2) &= 0 && \text{Simplify.} \\
 x &= 0 && \text{Combine like terms and solve.}
 \end{aligned}$$

This technique is applied in the next example.

EXAMPLE 11 Clearing fractions

Clear fractions from the equation and solve.

$$\frac{3}{x} + \frac{x}{x^2 - 1} - \frac{4}{x + 1} = 0$$

SOLUTION The LCD is $x(x^2 - 1) = x(x - 1)(x + 1)$.

$$\begin{aligned} x(x^2 - 1) \left(\frac{3}{x} + \frac{x}{x^2 - 1} - \frac{4}{x + 1} \right) &= x(x^2 - 1) \cdot 0 \\ \frac{3x(x^2 - 1)}{x} + \frac{x(x)(x^2 - 1)}{x^2 - 1} - \frac{4x(x^2 - 1)}{x + 1} &= 0 \\ \frac{3x(x^2 - 1)}{x} + \frac{x^2(x^2 - 1)}{x^2 - 1} - \frac{4x(x - 1)(x + 1)}{x + 1} &= 0 \\ 3(x^2 - 1) + x^2 - 4x(x - 1) &= 0 \\ 3x^2 - 3 + x^2 - 4x^2 + 4x &= 0 \\ 4x - 3 &= 0 \\ x &= \frac{3}{4} \end{aligned}$$

The solution is $\frac{3}{4}$. Check this answer.

Now Try Exercise 111 ◀

Complex Fractions

A complex fraction is a rational expression that contains fractions in its numerator, denominator, or both. One strategy for simplifying a complex fraction is to multiply the numerator and denominator by the LCD of the fractions in the numerator and denominator. For example, the LCD for the complex fraction

$$\frac{1 - \frac{1}{x}}{1 + \frac{1}{2x}}$$

is $2x$. To simplify, multiply the complex fraction by 1 , expressed in the form $\frac{2x}{2x}$.

$$\begin{aligned} \frac{\left(1 - \frac{1}{x}\right) \cdot 2x}{\left(1 + \frac{1}{2x}\right) \cdot 2x} &= \frac{2x - \frac{2x}{x}}{2x + \frac{2x}{2x}} && \text{Distributive property} \\ &= \frac{2x - 2}{2x + 1} && \text{Simplify.} \end{aligned}$$

In the next example, we simplify a complex fraction.

EXAMPLE 12 Simplifying a complex fraction

Simplify the complex fraction.

$$\frac{\frac{3}{x - 1} - \frac{2}{x}}{\frac{1}{x - 1} + \frac{3}{x}}$$

SOLUTION The LCD is the product, $x(x - 1)$. Multiply the expression by $\frac{x(x - 1)}{x(x - 1)}$.

$$\begin{aligned}
 \left(\frac{3}{x-1} - \frac{2}{x} \right) \cdot \frac{x(x-1)}{x(x-1)} &= \frac{3x(x-1)}{x-1} - \frac{2x(x-1)}{x} && \text{Distributive property} \\
 \left(\frac{1}{x-1} + \frac{3}{x} \right) \cdot \frac{x(x-1)}{x(x-1)} &= \frac{x(x-1)}{x-1} + \frac{3x(x-1)}{x} \\
 &= \frac{3x - 2(x-1)}{x + 3(x-1)} && \text{Simplify.} \\
 &= \frac{3x - 2x + 2}{x + 3x - 3} && \text{Distributive property} \\
 &= \frac{x + 2}{4x - 3} && \text{Combine like terms.}
 \end{aligned}$$

$$89. \frac{2x}{x-5} + \frac{2x-1}{3x^2-16x+5}$$

$$90. \frac{x+3}{2x-1} + \frac{3}{10x^2-5x}$$

$$91. \frac{x}{(x-1)^2} - \frac{1}{(x-1)(x+3)}$$

$$92. \frac{3}{x^2-x-6} - \frac{2}{x^2+5x+6}$$

$$93. \frac{x}{x^2-5x+4} + \frac{2}{x^2-2x-8}$$

$$94. \frac{3}{x^2-2x+1} + \frac{1}{x^2-3x+2}$$

$$95. \frac{x}{x^2-4} - \frac{1}{x^2+4x+4}$$

$$96. \frac{3x}{x^2+2x-3} + \frac{1}{x^2-2x+1}$$

$$97. \frac{3x}{x-y} - \frac{3y}{x^2-2xy+y^2}$$

$$98. \frac{4c}{ab} + \frac{3b}{ac} - \frac{2a}{bc} \quad 99. x + \frac{1}{x-1} - \frac{1}{x+1}$$

$$100. 5 - \frac{6}{n^2-36} + \frac{3}{n-6}$$

$$101. \frac{6}{t-1} + \frac{2}{t-2} + \frac{1}{t}$$

$$102. \frac{3}{x-5} - \frac{1}{x-3} - \frac{2x}{x-5}$$

$$107. \frac{2x}{9-x^2} + \frac{1}{3-x} = 0$$

$$108. \frac{1}{1-x^2} + \frac{1}{1+x} = 0$$

$$109. \frac{1}{2x} + \frac{1}{2x^2} - \frac{1}{x^3} = 0$$

$$110. \frac{1}{x^2-16} + \frac{4}{x+4} - \frac{5}{x-4} = 0$$

$$111. \frac{1}{x} - \frac{2}{x+5} + \frac{1}{x-5} = 0$$

$$112. \frac{1}{x-2} + \frac{1}{x-3} - \frac{2}{x} = 0$$

Complex Fractions

Exercises 113–124: Simplify the expression.

$$113. \frac{1 + \frac{1}{x}}{1 - \frac{1}{x}}$$

$$114. \frac{\frac{1}{2} - x}{\frac{1}{x} - 2}$$

$$115. \frac{\frac{1}{x-5}}{\frac{4}{x} - \frac{1}{x-5}}$$

$$116. \frac{1 + \frac{1}{x-3}}{\frac{1}{x-3} - 1}$$

$$117. \frac{\frac{1}{x} + \frac{2-x}{x^2}}{\frac{3}{x^2} - \frac{1}{x}}$$

$$118. \frac{\frac{1}{x-1} + \frac{2}{x}}{2 - \frac{1}{x}}$$

$$119. \frac{\frac{1}{x+3} + \frac{2}{x-3}}{2 - \frac{1}{x-3}}$$

$$120. \frac{\frac{1}{x} + \frac{2}{x}}{\frac{1}{x-1} + \frac{x}{2}}$$

$$121. \frac{\frac{4}{x-5}}{\frac{1}{x+5} + \frac{1}{x}}$$

$$122. \frac{\frac{2}{x-4}}{1 - \frac{1}{x+4}}$$

$$123. \frac{\frac{1}{2a} - \frac{1}{2b}}{\frac{1}{a^2} - \frac{1}{b^2}}$$

$$124. \frac{\frac{1}{2x^2} - \frac{1}{2y^2}}{\frac{1}{3y^2} + \frac{1}{3x^2}}$$

Clearing Fractions

Exercises 103–112: (Refer to Example 11.) Clear fractions and solve. Check your answers.

$$103. \frac{1}{x} + \frac{3}{x^2} = 0 \quad 104. \frac{1}{x-2} + \frac{3}{x+1} = 0$$

$$105. \frac{1}{x} + \frac{3x}{2x-1} = 0 \quad 106. \frac{x}{2x-5} + \frac{4}{x} = 0$$

R.6 Radical Notation and Rational Exponents

- Use radical notation
- Apply rational exponents
- Use properties of rational exponents

Radical Notation

Square Root Recall the definition of the square root of a number a .

Square Root

The number b is a *square root* of a if $b^2 = a$.

Every positive number a has two square roots, one positive and one negative. For example, the square roots of 100 are 10 and -10 . Recall that the *positive* square root is called the *principal square root* and is denoted \sqrt{a} . The *negative square root* is denoted $-\sqrt{a}$. To identify both square roots, we write $\pm\sqrt{a}$. The symbol \pm is read “plus or minus.” The symbol $\sqrt{}$ is called the **radical sign**. The expression under the radical sign is called the **radicand**, and an expression containing a radical sign is called a **radical expression**. Examples of radical expressions include

$$\sqrt{6}, \quad 5 + \sqrt{x+1}, \quad \text{and} \quad \sqrt{\frac{3x}{2x-1}}.$$

In the next example, we show how to find the principal square root of an expression.

EXAMPLE 1 Finding principal square roots

Find the principal square root of each expression.

- (a) 25 (b) 17 (c) $\frac{4}{9}$ (d) $c^2, c > 0$

SOLUTION

- (a) Because $5 \cdot 5 = 25$, the principal, or positive, square root of 25 is $\sqrt{25} = 5$.
 (b) The principal square root of 17 is $\sqrt{17}$. This value is not an integer, but we can approximate it. Figure R.18 shows that $\sqrt{17} \approx 4.12$, rounded to the nearest hundredth. Note that calculators do not give exact answers when approximating many radical expressions; they give decimal approximations.
 (c) Because $\frac{2}{3} \cdot \frac{2}{3} = \frac{4}{9}$, the principal square root of $\frac{4}{9}$ is $\sqrt{\frac{4}{9}} = \frac{2}{3}$.
 (d) The principal square root of c^2 is $\sqrt{c^2} = c$, as it is given that c is positive.

Now Try Exercises 7, 9, 11, and 13 ◀

Figure R.18

Cube Root Another common radical expression is the cube root of a number a , denoted $\sqrt[3]{a}$.

Cube Root

The number b is a *cube root* of a if $b^3 = a$.

Although the square root of a negative number is not a real number, the cube root of a negative number is a negative real number. *Every real number has one real cube root.*

EXAMPLE 2 Finding cube roots

Find the cube root of each expression.

- (a) 8 (b) -27 (c) 16 (d)
- $\frac{1}{64}$
- (e)
- d^6

SOLUTION

- (a) $\sqrt[3]{8} = 2$ because $2^3 = 2 \cdot 2 \cdot 2 = 8$.
 (b) $\sqrt[3]{-27} = -3$ because $(-3)^3 = (-3)(-3)(-3) = -27$.
 (c) $\sqrt[3]{16}$ is not an integer. Figure R.19 shows that $\sqrt[3]{16} \approx 2.52$.
 (d) $\sqrt[3]{\frac{1}{64}} = \frac{1}{4}$ because $(\frac{1}{4})^3 = \frac{1}{4} \cdot \frac{1}{4} \cdot \frac{1}{4} = \frac{1}{64}$.
 (e) $\sqrt[3]{d^6} = d^2$ because $(d^2)^3 = d^2 \cdot d^2 \cdot d^2 = d^{2+2+2} = d^6$.

Now Try Exercises 15, 17, 19, 21, and 31 ◀

Figure R.19

n th Root We can generalize square roots and cube roots to include the n th root of a number a . The number b is an **n th root** of a if $b^n = a$, where n is a positive integer, and the principal n th root is denoted $\sqrt[n]{a}$. The number n is called the **index**. For the square root, the index is 2, although we usually write \sqrt{a} rather than $\sqrt[2]{a}$. When n is odd, we are finding an **odd root**, and when n is even, we are finding an **even root**. The square root \sqrt{a} is an example of an even root, and the cube root $\sqrt[3]{a}$ is an example of an odd root.

NOTE An odd root of a negative number is a negative number, but the even root of a negative number is *not* a real number. For example, $\sqrt[3]{-8} = -2$, whereas $\sqrt[4]{-81}$ is *not* a real number.

EXAMPLE 3 Finding n th roots

Find each root.

- (a)
- $\sqrt[4]{16}$
- (b)
- $\sqrt[5]{-32}$

SOLUTION

- (a) $\sqrt[4]{16} = 2$ because $2^4 = 2 \cdot 2 \cdot 2 \cdot 2 = 16$. Note that when n is even the principal n th root is positive.
 (b) $\sqrt[5]{-32} = -2$ because $(-2)^5 = (-2)(-2)(-2)(-2)(-2) = -32$.

Now Try Exercises 37 and 38 ◀

Rational Exponents

When m and n are integers, the product rule states that $a^m a^n = a^{m+n}$. This rule can be extended to include exponents that are fractions. For example,

$$4^{1/2} \cdot 4^{1/2} = 4^{1/2+1/2} = 4^1 = 4.$$

That is, if we multiply $4^{1/2}$ by itself, the result is 4. Because we also know that $\sqrt{4} \cdot \sqrt{4} = 4$, this discussion suggests that $4^{1/2} = \sqrt{4}$ and motivates the following definition.

The Expression $a^{1/n}$ If n is an integer greater than 1, then

$$a^{1/n} = \sqrt[n]{a}.$$

If $a < 0$ and n is an even positive integer, then $a^{1/n}$ is not a real number.

The next two examples show how to interpret rational exponents.

EXAMPLE 4 Interpreting rational exponents

Write each expression in radical notation. Then evaluate the expression (to the nearest hundredth when appropriate).

(a) $36^{1/2}$ (b) $23^{1/5}$ (c) $(5x)^{1/2}$

SOLUTION

(a) The exponent $\frac{1}{2}$ indicates a square root. Thus $36^{1/2} = \sqrt{36}$, which evaluates to 6.

(b) The exponent $\frac{1}{5}$ indicates a fifth root. Thus $23^{1/5} = \sqrt[5]{23}$, which is not an integer. Figure R.20 shows this expression approximated in both exponential and radical notation. In either case $23^{1/5} \approx 1.87$.

(c) The exponent $\frac{1}{2}$ indicates a square root, so $(5x)^{1/2} = \sqrt{5x}$.

Now Try Exercises 41, 43, and 59 ◀

Figure R.20

Suppose that we want to define the expression $8^{2/3}$. On the one hand, using properties of exponents we have

$$8^{1/3} \cdot 8^{1/3} = 8^{1/3+1/3} = 8^{2/3}.$$

On the other hand, we have

$$8^{1/3} \cdot 8^{1/3} = \sqrt[3]{8} \cdot \sqrt[3]{8} = 2 \cdot 2 = 4.$$

Thus $8^{2/3} = 4$, and that value is obtained whether we interpret $8^{2/3}$ as either

$$8^{2/3} = (8^2)^{1/3} = \sqrt[3]{8^2} = \sqrt[3]{64} = 4$$

or

$$8^{2/3} = (8^{1/3})^2 = (\sqrt[3]{8})^2 = 2^2 = 4.$$

This result illustrates that $8^{2/3} = \sqrt[3]{8^2} = (\sqrt[3]{8})^2 = 4$ and suggests the following definition.

The Expression $a^{m/n}$

If m and n are positive integers with $\frac{m}{n}$ in lowest terms, then

$$a^{m/n} = \sqrt[n]{a^m} = (\sqrt[n]{a})^m.$$

If $a < 0$ and n is an even integer, then $a^{m/n}$ is not a real number.

EXAMPLE 5 Interpreting rational exponents

Write each expression in radical notation. Then evaluate the expression when the result is an integer.

(a) $(-27)^{2/3}$ (b) $12^{3/5}$

SOLUTION

(a) The exponent $\frac{2}{3}$ indicates either that we take the cube root of -27 and then square it or that we square -27 and then take the cube root. In either case the result will be the same. Thus

$$(-27)^{2/3} = (\sqrt[3]{-27})^2 = (-3)^2 = 9$$

or

$$(-27)^{2/3} = \sqrt[3]{(-27)^2} = \sqrt[3]{729} = 9.$$

- (b) The exponent $\frac{3}{5}$ indicates either that we take the fifth root of 12 and then cube it or that we cube 12 and then take the fifth root. Thus

$$12^{3/5} = (\sqrt[5]{12})^3 \quad \text{or} \quad 12^{3/5} = \sqrt[5]{12^3}.$$

This result is not an integer.

Now Try Exercises 47 and 61

From properties of exponents we know that $a^{-n} = \frac{1}{a^n}$, where n is a positive integer. We now define this property for negative rational exponents.

The Expression $a^{-m/n}$

If m and n are positive integers with $\frac{m}{n}$ in lowest terms, then

$$a^{-m/n} = \frac{1}{a^{m/n}}, \quad a \neq 0.$$

EXAMPLE 1 Interpreting negative rational exponents

Write each expression in radical notation and then evaluate.

- (a) $(64)^{-1/3}$ (b) $(81)^{-3/4}$

SOLUTION

$$(a) \quad (64)^{-1/3} = \frac{1}{64^{1/3}} = \frac{1}{\sqrt[3]{64}} = \frac{1}{4}$$

$$(b) \quad (81)^{-3/4} = \frac{1}{81^{3/4}} = \frac{1}{(\sqrt[4]{81})^3} = \frac{1}{3^3} = \frac{1}{27}$$

Now Try Exercises 51 and 53

Properties of Rational Exponents

Any rational number can be written as a ratio of two integers. That is, if p is a rational number, then $p = \frac{m}{n}$, where m and n are integers. Properties for integer exponents also apply to rational exponents—with one exception. If n is even in the expression $a^{m/n}$ and $\frac{m}{n}$ is written in lowest terms, then a must be nonnegative (not negative) for the result to be a real number.

Properties of Exponents

Let p and q be rational numbers written in lowest terms. For all real numbers a and b for which the expressions are real numbers, the following properties hold.

- $a^p \cdot a^q = a^{p+q}$ Product rule for exponents
- $a^{-p} = \frac{1}{a^p}, \quad \frac{1}{a^{-p}} = a^p$ Negative exponents
- $\left(\frac{a}{b}\right)^{-p} = \left(\frac{b}{a}\right)^p$ Negative exponents for quotients
- $\frac{a^p}{a^q} = a^{p-q}$ Quotient rule for exponents
- $(a^p)^q = a^{pq}$ Power rule for exponents
- $(ab)^p = a^p b^p$ Power rule for products
- $\left(\frac{a}{b}\right)^p = \frac{a^p}{b^p}$ Power rule for quotients

In the next example, we apply these properties.

EXAMPLE 1 Applying properties of exponents

Write each expression using rational exponents and simplify. Write the answer with a positive exponent. Assume that all variables are positive numbers.

(a) $\sqrt{x} \cdot \sqrt[3]{x}$ (b) $\sqrt[3]{27x^2}$ (c) $\left(\frac{x^2}{81}\right)^{-1/2}$

SOLUTION

(a) $\sqrt{x} \cdot \sqrt[3]{x} = x^{1/2} \cdot x^{1/3}$ Use rational exponents.
 $= x^{1/2 + 1/3}$ Product rule for exponents
 $= x^{5/6}$ Simplify.

(b) $\sqrt[3]{27x^2} = (27x^2)^{1/3}$ Use rational exponents.
 $= 27^{1/3}(x^2)^{1/3}$ Power rule for products
 $= 3x^{2/3}$ Power rule for exponents

(c) $\left(\frac{x^2}{81}\right)^{-1/2} = \left(\frac{81}{x^2}\right)^{1/2}$ Negative exponents for quotients
 $= \frac{(81)^{1/2}}{(x^2)^{1/2}}$ Power rule for quotients
 $= \frac{9}{x}$ Power rule for exponents; simplify.

Now Try Exercises 81, 89, and 99 ◀

R.7 Radical Expressions

- Apply the product rule
- Simplify radical expressions
- Apply the quotient rule
- Perform addition, subtraction, and multiplication on radical expressions
- Rationalize the denominator

Product Rule for Radical Expressions

The product of two (like) roots is equal to the root of their product.

Product Rule for Radical Expressions

Let a and b be real numbers, where $\sqrt[n]{a}$ and $\sqrt[n]{b}$ are both defined. Then

$$\sqrt[n]{a} \cdot \sqrt[n]{b} = \sqrt[n]{a \cdot b}.$$

NOTE The product rule works only when the radicals have the *same* index.

We apply the product rule in the next two examples.

EXAMPLE 1 Multiplying radical expressions

Multiply each pair of radical expressions.

(a) $\sqrt{5} \cdot \sqrt{20}$ (b) $\sqrt[3]{-3} \cdot \sqrt[3]{9}$

SOLUTION

(a) $\sqrt{5} \cdot \sqrt{20} = \sqrt{5 \cdot 20} = \sqrt{100} = 10$

(b) $\sqrt[3]{-3} \cdot \sqrt[3]{9} = \sqrt[3]{-3 \cdot 9} = \sqrt[3]{-27} = -3$

Now Try Exercises 3 and 5 ◀

EXAMPLE 2 Multiplying radical expressions containing variables

Multiply each pair of radical expressions. Assume that all variables are positive.

(a) $\sqrt{x} \cdot \sqrt{x^3}$ (b) $\sqrt[3]{2a} \cdot \sqrt[3]{5a}$ (c) $\sqrt[5]{\frac{2x}{y}} \cdot \sqrt[5]{\frac{16y}{x}}$

SOLUTION

(a) $\sqrt{x} \cdot \sqrt{x^3} = \sqrt{x \cdot x^3} = \sqrt{x^4} = x^2$

(b) $\sqrt[3]{2a} \cdot \sqrt[3]{5a} = \sqrt[3]{2a \cdot 5a} = \sqrt[3]{10a^2}$

$$\begin{aligned} \text{(c)} \quad \sqrt[5]{\frac{2x}{y}} \cdot \sqrt[5]{\frac{16y}{x}} &= \sqrt[5]{\frac{2x}{y} \cdot \frac{16y}{x}} \\ &= \sqrt[5]{\frac{32xy}{xy}} \\ &= \sqrt[5]{32} \\ &= 2 \end{aligned}$$

Product rule

Multiply fractions.

Simplify.

$$2^5 = 32$$

Now Try Exercises 27, 33, and 35 ◀

Simplifying Radicals An integer a is a **perfect n th power** if there exists an integer b such that $b^n = a$. Thus 36 is a **perfect square** because $6^2 = 36$, 8 is a **perfect cube** because $2^3 = 8$, and 81 is a **perfect fourth power** because $3^4 = 81$.

The product rule for radicals can be used to simplify radical expressions. For example, because the largest perfect square factor of 50 is 25, the expression $\sqrt{50}$ can be simplified as

$$\sqrt{50} = \sqrt{25 \cdot 2} = \sqrt{25} \cdot \sqrt{2} = 5\sqrt{2}.$$

This procedure is generalized as follows.

Simplifying Radicals (n th Roots)

STEP 1: Determine the largest perfect n th power factor of the radicand.

STEP 2: Use the product rule to factor out and simplify this perfect n th power.

EXAMPLE 3 Simplifying radical expressions

Simplify each expression.

(a) $\sqrt{300}$ (b) $\sqrt[3]{16}$ (c) $\sqrt[4]{512}$

SOLUTION

(a) First note that $300 = 100 \cdot 3$ and that 100 is the largest perfect square factor of 300.

$$\sqrt{300} = \sqrt{100} \cdot \sqrt{3} = 10\sqrt{3}$$

(b) The largest perfect cube factor of 16 is 8. Thus $\sqrt[3]{16} = \sqrt[3]{8} \cdot \sqrt[3]{2} = 2\sqrt[3]{2}$.

(c) $\sqrt[4]{512} = \sqrt[4]{256} \cdot \sqrt[4]{2} = 4\sqrt[4]{2}$ because $4^4 = 256$.

Now Try Exercises 37, 39, and 41 ◀

NOTE To simplify a cube root of a negative number, we usually factor out the negative of the largest perfect cube factor. For example, because $-16 = -8 \cdot 2$, it follows that $\sqrt[3]{-16} = \sqrt[3]{-8} \cdot \sqrt[3]{2} = -2\sqrt[3]{2}$. This procedure can be used with any odd root of a negative number.

EXAMPLE 4 Simplifying radical expressions

Simplify each expression. Assume that all variables are positive.

(a) $\sqrt{25x^4}$ (b) $\sqrt{32n^3}$ (c) $\sqrt[3]{-16x^3y^5}$ (d) $\sqrt[3]{2a} \cdot \sqrt[3]{4a^2b}$

SOLUTION

(a) $\sqrt{25x^4} = 5x^2$

$(5x^2)^2 = 25x^4$

(b) $\sqrt{32n^3} = \sqrt{(16n^2)2n}$
 $= \sqrt{16n^2} \cdot \sqrt{2n}$
 $= 4n\sqrt{2n}$

$16n^2$ is the largest perfect square factor.

Product rule

$(4n)^2 = 16n^2$

(c) $\sqrt[3]{-16x^3y^5} = \sqrt[3]{(-8x^3y^3)2y^2}$
 $= \sqrt[3]{-8x^3y^3} \cdot \sqrt[3]{2y^2}$
 $= -2xy\sqrt[3]{2y^2}$

$8x^3y^3$ is the largest perfect cube factor.

Product rule

$(-2xy)^3 = -8x^3y^3$

(d) $\sqrt[3]{2a} \cdot \sqrt[3]{4a^2b} = \sqrt[3]{(2a)(4a^2b)}$
 $= \sqrt[3]{(8a^3)b}$
 $= \sqrt[3]{8a^3} \cdot \sqrt[3]{b}$
 $= 2a\sqrt[3]{b}$

Product rule

$8a^3$ is the largest perfect cube factor.

Product rule

$(2a)^3 = 8a^3$

Now Try Exercises 45, 47, 49, and 51 ◀

The product rule for radical expressions cannot be used if the radicals do not have the same indexes. In this case we use rational exponents, as illustrated in the next example.

EXAMPLE 5 Multiplying radicals with different indexes

Simplify each expression. Write your answer in radical notation.

(a) $\sqrt{2} \cdot \sqrt[3]{4}$ (b) $\sqrt[3]{x} \cdot \sqrt[4]{x}$

SOLUTION

(a) First note that $\sqrt[3]{4} = \sqrt[3]{2^2} = 2^{2/3}$. Thus

$$\sqrt{2} \cdot \sqrt[3]{4} = 2^{1/2} \cdot 2^{2/3} = 2^{1/2+2/3} = 2^{7/6}.$$

In radical notation, $2^{7/6} = \sqrt[6]{2^7} = \sqrt[6]{2^6 \cdot 2^1} = \sqrt[6]{2^6} \cdot \sqrt[6]{2} = 2\sqrt[6]{2}$.

(b) $\sqrt[3]{x} \cdot \sqrt[4]{x} = x^{1/3} \cdot x^{1/4} = x^{7/12} = \sqrt[12]{x^7}$

Now Try Exercises 57 and 59 ◀

Quotient Rule for Radical Expressions

The root of a quotient is equal to the quotient of the roots.

Quotient Rule for Radical Expressions

Let a and b be real numbers, where $\sqrt[n]{a}$ and $\sqrt[n]{b}$ are both defined and $b \neq 0$. Then

$$\sqrt[n]{\frac{a}{b}} = \frac{\sqrt[n]{a}}{\sqrt[n]{b}}.$$

EXAMPLE 4 Simplifying quotients

Simplify each radical expression. Assume that all variables are positive.

(a) $\sqrt[3]{\frac{5}{8}}$ (b) $\sqrt{\frac{16}{y^2}}$

SOLUTION

(a) $\sqrt[3]{\frac{5}{8}} = \frac{\sqrt[3]{5}}{\sqrt[3]{8}} = \frac{\sqrt[3]{5}}{2}$

(b) $\sqrt{\frac{16}{y^2}} = \frac{\sqrt{16}}{\sqrt{y^2}} = \frac{4}{y}$ because $y > 0$.

Now Try Exercises 7 and 21 ◀

EXAMPLE 5 Simplifying radical expressions

Simplify each radical expression. Assume that all variables are positive.

(a) $\frac{\sqrt{40}}{\sqrt{10}}$ (b) $\sqrt[4]{\frac{16x^3}{y^4}}$ (c) $\sqrt{\frac{5a^2}{8}} \cdot \sqrt{\frac{5a^3}{2}}$

SOLUTION

(a) $\frac{\sqrt{40}}{\sqrt{10}} = \sqrt{\frac{40}{10}} = \sqrt{4} = 2$

(b) $\sqrt[4]{\frac{16x^3}{y^4}} = \frac{\sqrt[4]{16x^3}}{\sqrt[4]{y^4}} = \frac{\sqrt[4]{16} \cdot \sqrt[4]{x^3}}{\sqrt[4]{y^4}} = \frac{2\sqrt[4]{x^3}}{y}$

(c) To simplify this expression, we use both the product and quotient rules.

$$\sqrt{\frac{5a^2}{8}} \cdot \sqrt{\frac{5a^3}{2}} = \sqrt{\frac{25a^5}{16}} \quad \text{Product rule}$$

$$= \frac{\sqrt{25a^5}}{\sqrt{16}} \quad \text{Quotient rule}$$

$$= \frac{\sqrt{25a^4} \cdot \sqrt{a}}{\sqrt{16}} \quad \text{Factor out largest perfect square.}$$

$$= \frac{5a^2\sqrt{a}}{4} \quad (5a^2)^2 = 25a^4$$

Now Try Exercises 13, 22, and 35 ◀

Addition and Subtraction

We can add $2x^2$ and $5x^2$ to obtain $7x^2$ because they are *like terms*. That is,

$$2x^2 + 5x^2 = (2 + 5)x^2 = 7x^2.$$

We can add and subtract **like radicals**, which have the same index and the same radicand. For example, we can add $3\sqrt{2}$ and $5\sqrt{2}$ because they are like radicals.

$$3\sqrt{2} + 5\sqrt{2} = (3 + 5)\sqrt{2} = 8\sqrt{2}$$

Sometimes two radical expressions that are not alike can be added by changing them to like radicals. For example, $\sqrt{20}$ and $\sqrt{5}$ are unlike radicals. However,

$$\sqrt{20} = \sqrt{4 \cdot 5} = \sqrt{4} \cdot \sqrt{5} = 2\sqrt{5},$$

so

$$\sqrt{20} + \sqrt{5} = 2\sqrt{5} + \sqrt{5} = 3\sqrt{5}.$$

We cannot combine $x + x^2$ because they are unlike terms. Similarly, we cannot combine $\sqrt{2} + \sqrt{5}$ because they are unlike radicals.

EXAMPLE 8 Adding radical expressions

Add the expressions and simplify.

$$(a) 10\sqrt{11} + 4\sqrt{11} \quad (b) 5\sqrt[3]{6} + \sqrt[3]{6} \quad (c) \sqrt{12} + 7\sqrt{3}$$

SOLUTION

$$(a) 10\sqrt{11} + 4\sqrt{11} = (10 + 4)\sqrt{11} = 14\sqrt{11}$$

$$(b) 5\sqrt[3]{6} + \sqrt[3]{6} = (5 + 1)\sqrt[3]{6} = 6\sqrt[3]{6}$$

$$\begin{aligned} (c) \sqrt{12} + 7\sqrt{3} &= \sqrt{4 \cdot 3} + 7\sqrt{3} \\ &= \sqrt{4} \cdot \sqrt{3} + 7\sqrt{3} \\ &= 2\sqrt{3} + 7\sqrt{3} \\ &= 9\sqrt{3} \end{aligned}$$

Now Try Exercises 63, 68, and 69

EXAMPLE 9 Adding radical expressions

Add the expressions and simplify. Assume that all variables are positive.

$$(a) -2\sqrt{4x} + \sqrt{x} \quad (b) 3\sqrt{3k} + 5\sqrt{12k} + 9\sqrt{48k}$$

SOLUTION

$$(a) \text{ Note that } \sqrt{4x} = \sqrt{4} \cdot \sqrt{x} = 2\sqrt{x}.$$

$$-2\sqrt{4x} + \sqrt{x} = -2(2\sqrt{x}) + \sqrt{x} = -4\sqrt{x} + \sqrt{x} = -3\sqrt{x}$$

$$(b) \text{ Note that } \sqrt{12k} = \sqrt{4} \cdot \sqrt{3k} = 2\sqrt{3k} \text{ and that } \sqrt{48k} = \sqrt{16} \cdot \sqrt{3k} = 4\sqrt{3k}.$$

$$\begin{aligned} 3\sqrt{3k} + 5\sqrt{12k} + 9\sqrt{48k} &= 3\sqrt{3k} + 5(2\sqrt{3k}) + 9(4\sqrt{3k}) \\ &= (3 + 10 + 36)\sqrt{3k} \\ &= 49\sqrt{3k} \end{aligned}$$

Now Try Exercises 77 and 83

Subtraction of radical expressions is similar to addition, as illustrated in the next example.

EXAMPLE 10 Subtracting radical expressions

Subtract and simplify. Assume that all variables are positive.

(a) $3\sqrt[3]{xy^2} - 2\sqrt[3]{xy^2}$ (b) $\sqrt{16x^3} - \sqrt{x^3}$

SOLUTION

(a) $3\sqrt[3]{xy^2} - 2\sqrt[3]{xy^2} = (3 - 2)\sqrt[3]{xy^2} = \sqrt[3]{xy^2}$

(b) $\begin{aligned}\sqrt{16x^3} - \sqrt{x^3} &= \sqrt{16} \cdot \sqrt{x^3} - \sqrt{x^3} \\ &= 4\sqrt{x^3} - \sqrt{x^3} \\ &= 3\sqrt{x^3} \\ &= 3x\sqrt{x}\end{aligned}$

Now Try Exercises 75 and 81 ◀

Multiplication

Some types of radical expressions can be multiplied like binomials. The next example demonstrates this technique.

EXAMPLE 11 Multiplying radical expressions

Multiply and simplify.

(a) $(\sqrt{b} - 4)(\sqrt{b} + 5)$ (b) $(4 + \sqrt{3})(4 - \sqrt{3})$

SOLUTION

(a) This expression can be multiplied and then simplified.

$$\begin{aligned}(\sqrt{b} - 4)(\sqrt{b} + 5) &= \sqrt{b} \cdot \sqrt{b} + 5\sqrt{b} - 4\sqrt{b} - 4 \cdot 5 \\ &= b + \sqrt{b} - 20\end{aligned}$$

Compare this product to $(b - 4)(b + 5) = b^2 + b - 20$.

(b) This expression is in the form $(a + b)(a - b)$, which equals $a^2 - b^2$.

$$\begin{aligned}(4 + \sqrt{3})(4 - \sqrt{3}) &= (4)^2 - (\sqrt{3})^2 \\ &= 16 - 3 \\ &= 13\end{aligned}$$

Now Try Exercises 89 and 95 ◀

Rationalizing the Denominator

Quotients containing radical expressions can appear to be different but actually be equal. For example, $\frac{1}{\sqrt{3}}$ and $\frac{\sqrt{3}}{3}$ represent the same real number even though they do not look equal. To show this fact, we multiply the first quotient by 1 in the form $\frac{\sqrt{3}}{\sqrt{3}}$.

$$\frac{1}{\sqrt{3}} \cdot \frac{\sqrt{3}}{\sqrt{3}} = \frac{1 \cdot \sqrt{3}}{\sqrt{3} \cdot \sqrt{3}} = \frac{\sqrt{3}}{3}$$

NOTE $\sqrt{b} \cdot \sqrt{b} = \sqrt{b^2} = b$ for any positive number b .

One way to standardize radical expressions is to remove any radical expressions from the denominator. This process is called **rationalizing the denominator**. The next example demonstrates how to rationalize the denominator of two quotients.

EXAMPLE 12 Rationalizing the denominator

Rationalize each denominator. Assume that all variables are positive.

(a) $\frac{3}{5\sqrt{3}}$ (b) $\sqrt{\frac{x}{24}}$

SOLUTION

(a) We multiply this expression by 1 in the form $\frac{\sqrt{3}}{\sqrt{3}}$.

$$\frac{3}{5\sqrt{3}} \cdot \frac{\sqrt{3}}{\sqrt{3}} = \frac{3\sqrt{3}}{5\sqrt{9}} = \frac{3\sqrt{3}}{5 \cdot 3} = \frac{\sqrt{3}}{5}$$

(b) Because $\sqrt{24} = \sqrt{4} \cdot \sqrt{6} = 2\sqrt{6}$, we start by simplifying the expression.

$$\sqrt{\frac{x}{24}} = \frac{\sqrt{x}}{\sqrt{24}} = \frac{\sqrt{x}}{2\sqrt{6}}$$

To rationalize the denominator, we multiply this expression by 1 in the form $\frac{\sqrt{6}}{\sqrt{6}}$.

$$\frac{\sqrt{x}}{2\sqrt{6}} = \frac{\sqrt{x}}{2\sqrt{6}} \cdot \frac{\sqrt{6}}{\sqrt{6}} = \frac{\sqrt{6x}}{12}$$

Now Try Exercises 99 and 101

If the denominator consists of two terms, at least one of which contains a radical expression, then the **conjugate** of the denominator is found by changing a + sign to a - sign or vice versa. For example, the conjugate of $\sqrt{2} + \sqrt{3}$ is $\sqrt{2} - \sqrt{3}$, and the conjugate of $\sqrt{3} - 1$ is $\sqrt{3} + 1$. In the next example, we multiply the numerator and denominator by the conjugate of the denominator to rationalize the denominator of fractions that contain radicals.

EXAMPLE 13 Rationalizing the denominator

Rationalize the denominator. Assume that all variables are positive.

(a) $\frac{3 + \sqrt{5}}{2 - \sqrt{5}}$ (b) $\frac{\sqrt{x}}{\sqrt{x} - 2}$

SOLUTION

(a) The conjugate of the denominator is $2 + \sqrt{5}$.

$$\begin{aligned} \frac{3 + \sqrt{5}}{2 - \sqrt{5}} &= \frac{(3 + \sqrt{5})}{(2 - \sqrt{5})} \cdot \frac{(2 + \sqrt{5})}{(2 + \sqrt{5})} && \text{Multiply by } \frac{\text{conjugate}}{\text{conjugate}}. \\ &= \frac{6 + 3\sqrt{5} + 2\sqrt{5} + (\sqrt{5})^2}{(2)^2 - (\sqrt{5})^2} && \text{Multiply.} \\ &= \frac{11 + 5\sqrt{5}}{4 - 5} && \text{Combine terms.} \\ &= -11 - 5\sqrt{5} && \text{Simplify.} \end{aligned}$$

(b) The conjugate of the denominator is $\sqrt{x} + 2$.

$$\begin{aligned}\frac{\sqrt{x}}{\sqrt{x} - 2} &= \frac{\sqrt{x}}{(\sqrt{x} - 2)} \cdot \frac{(\sqrt{x} + 2)}{(\sqrt{x} + 2)} \\ &= \frac{x + 2\sqrt{x}}{x - 4}\end{aligned}$$

Multiply by $\frac{\text{conjugate}}{\text{conjugate}}$

Multiply.

Now Try Exercises 103 and 109

Appendix A: Using the Graphing Calculator

A

Overview of the Appendix

The intent of this appendix is to provide instruction in the TI-83, TI-83 Plus, and TI-84 Plus graphing calculators that may be used in conjunction with this textbook. It includes specific keystrokes needed to work several examples from the text. Students are also advised to consult the *Graphing Calculator Guidebook* provided by the manufacturer.

The following is a listing of the topics covered in this appendix.

Displaying Numbers in Scientific Notation	AP-2	Accessing the Variable Y_1	AP-12
Entering Numbers in Scientific Notation	AP-2	Shading between Two Graphs	AP-12
Entering Mathematical Expressions	AP-2	Copying a Regression Equation into $Y_1 =$	AP-13
Setting the Viewing Rectangle	AP-3	Setting a Decimal Window	AP-13
Making a Scatterplot or a Line Graph	AP-3	Graphing an Inverse Function	AP-13
Entering a Formula for a Function	AP-4	Shading a System of Inequalities	AP-14
Graphing a Function	AP-5	Entering the Elements of a Matrix	AP-14
Evaluating a Function Graphically	AP-5	Reduced Row-Echelon Form	AP-15
Making a Table	AP-6	Performing Arithmetic Operations	
Squaring a Viewing Rectangle	AP-6	on Matrices	AP-15
Plotting Data and an Equation	AP-7	Finding the Inverse of a Matrix	AP-16
Accessing the Greatest Integer Function	AP-7	Solving a Linear System with	
Setting Connected and Dot Mode	AP-8	a Matrix Inverse	AP-17
Finding the Line of Least-Squares Fit	AP-8	Evaluating a Determinant	AP-17
Locating a Point of Intersection	AP-8	Creating a Sequence	AP-18
Locating a Zero of a Function	AP-9	Entering, Tabling, and Graphing

Figure A.2

Figure A.3 Normal Mode

Displaying Numbers in Scientific Notation

To display numbers in scientific notation when the calculator is in normal mode, set the graphing calculator in scientific mode (SCI) by using the following keystrokes. See Figure A.1.

(MODE) (▶) (ENTER) (2nd) (MODE [QUIT])

Figure A.2 shows the numbers 5432 and 0.00001234 displayed in scientific notation.

Summary: Setting Scientific Mode

If your calculator is in normal mode, it can be set in scientific mode by pressing

(MODE) (▶) (ENTER) (2nd) (MODE [QUIT]).

These keystrokes return the graphing calculator to the home screen.

Entering Numbers in Scientific Notation

Numbers can be entered in scientific notation. For example, to enter 4.2×10^{-3} in scientific notation, use the following keystrokes. (Be sure to use the negation key (–) rather than the subtraction key.)

(4) (.) (2) (2nd) ([EE]) (–) (3)

This number can also be entered using the following keystrokes. See Figure A.3.

(4) (.) (2) (×) (1) (0) (^) (() (–) (3) ())

Summary: Entering Numbers in Scientific Notation

One way to enter a number in scientific notation is to use the keystrokes

(2nd) (,)

to access an exponent (EE) of 10.

Entering Mathematical Expressions

Several expressions are evaluated in Example 6, Section 1.1. To evaluate $\sqrt[3]{131}$, use the following keystrokes from the home screen.

(MATH) (4) (1) (3) (1) () (ENTER)

To calculate $\pi^3 + 1.2^2$, use the following keystrokes. (Do *not* use 3.14 for π .)

(2nd) (^[π]) (^) (3) (+) (1) (.) (2) (x²) (ENTER)

To calculate $|\sqrt{3} - 6|$, use the following keystrokes.

(MATH) (▶) (1) (2nd) (x²[√]) (3) () (–) (6) () (ENTER)

Summary: Entering Common Mathematical Expressions

To calculate a cube root, use the keystrokes MATH 4 .

To access the number π , use the keystrokes 2nd $\text{^}[\pi]$.

To access the absolute value, use the keystrokes MATH > 1 .

To access the square root, use the keystrokes 2nd $\text{x}^2[\sqrt{\quad}]$.

Figure A.9

Setting the Viewing Rectangle

In Example 12, Section 1.2, there are at least two ways to set the standard viewing rectangle to $[-10, 10, 1]$ by $[-10, 10, 1]$. The first method involves pressing ZOOM followed by 6 . (See Figure A.4.) The second method is to press WINDOW and enter the following keystrokes. (See Figure A.5.)

$\text{(-)} \text{1} \text{0} \text{ENTER} \text{1} \text{0} \text{ENTER} \text{1} \text{ENTER}$

$\text{(-)} \text{1} \text{0} \text{ENTER} \text{1} \text{0} \text{ENTER} \text{1} \text{ENTER}$

(Be sure to use the negation key $(-)$ rather than the subtraction key.) The viewing rectangle $[-30, 40, 10]$ by $[-400, 800, 100]$ can be set in a similar manner, as shown in Figure A.6. To see the viewing rectangle, press GRAPH .

Summary: Setting the Viewing Rectangle

To set the standard viewing rectangle, press ZOOM 6 . To set any viewing rectangle, press WINDOW and enter the necessary values. To see the viewing rectangle, press GRAPH .

Note: You do not need to change “Xres”.

Making a Scatterplot or a Line Graph

In Example 13, Section 1.2, we are asked to make a scatterplot with $(-5, -5)$, $(-2, 3)$, $(1, -7)$, and $(4, 8)$. Begin this task by following these steps.

1. Press STAT followed by 1 .
2. If list L1 is not empty, use the arrow keys to place the cursor on L1, as shown in Figure A.7. Then press CLEAR followed by ENTER . This deletes all elements in the list. Similarly, if L2 is not empty, clear the list.
3. Input each x -value into list L1, followed by ENTER . Input each y -value into list L2, followed by ENTER . See Figure A.8.

It is essential that both lists have the same number of values—otherwise an error message will appear when a scatterplot is attempted. Before these four points can be plotted, STATPLOT must be turned on. It is accessed by pressing

2nd Y- [STAT PLOT] ,

as shown in Figure A.9.

There are three possible STATPLOTS, numbered 1, 2, and 3. Any one of the three can be selected. The first plot is selected by pressing 1 . Next, place the cursor over “On”

Figure A.10

$[-10, 10, 1]$ by $[-10, 10, 1]$

Figure A.11

and press ENTER to turn Plot1 on. There are six types of plots that can be selected. The first type is a *scatterplot* and the second type is a *line graph*, so place the cursor over the first type of plot and press ENTER to select a scatterplot. (To make the line graph in Example 14, Section 1.2, be sure to select the line graph.) The x -values are stored in list L1, so select L1 for “Xlist” by pressing 2nd (1) . Similarly, press 2nd (2) for “Ylist,” since the y -values are stored in list L2. Finally, there are three styles of marks that can be used to show data points in the graph. We usually use the first, because it is largest and shows up the best. Make the screen appear as in Figure A.10. Before plotting the four data points, be sure to set an appropriate viewing rectangle. Then press GRAPH . The data points will appear as in Figure A.11.

NOTE 1 A fast way to set the viewing rectangle for any scatterplot is to select the ZOOM-STAT feature by pressing ZOOM (9) . This feature automatically scales the viewing rectangle so that all data points are shown.

NOTE 2 If an equation has been entered into the Y= menu and selected, it will be graphed with the data. Throughout this textbook, this feature is used frequently in modeling data.

NOTE 3 When the error message “ERR: DIM MISMATCH” appears, it usually means that there are not equal numbers of x -values and y -values in lists L1 and L2.

Summary: Making a Scatterplot or a Line Graph

The following are basic steps necessary to make either a scatterplot or a line graph.

- STEP 1:** Use STAT (1) to access lists L1 and L2.
- STEP 2:** If list L1 is not empty, place the cursor on L1 and press CLEAR ENTER . Repeat for list L2 if it is not empty.
- STEP 3:** Enter the x -values into list L1 and the y -values into list L2.
- STEP 4:** Use 2nd Y= [STAT PLOT] to set the appropriate parameters for the scatterplot or line graph.
- STEP 5:** Either set an appropriate viewing rectangle or press ZOOM (9) . This feature automatically sets the viewing rectangle and plots the data.

Note: ZOOM (9) cannot be used to set a viewing rectangle for the graph of a function.

Deleting and Inserting a List A list, such as L2, can be deleted. Press STAT (1) and then place the cursor on L2 and press DEL . If you want to insert a deleted list, press STAT (1) and then place the cursor where you want to insert the list. For example, to insert L2, place the cursor on L3. Press 2nd DEL [INS] 2nd 2[L2] .

Entering a Formula for a Function

To enter the formula for a function f , press Y= . For example, use the following keystrokes after “ $Y_1 =$ ” to enter $f(x) = 2x^2 - 3x + 7$. See Figure A.12.

Y= CLEAR (2) $\text{X,T,}\theta,\text{n}$ ^ (2) -- (3) $\text{X,T,}\theta,\text{n}$ + (7)

Figure A.12

Figure A.13

Note that there is a built-in key for entering the variable X . If “ $Y_1 =$ ” does not appear after you press $(Y=)$, press $(MODE)$ and make sure the calculator is set in function mode, denoted “Func”. See Figure A.13.

Summary: Entering a Formula for a Function

To enter the formula for a function, press $(Y=)$. To delete an existing formula, press $(CLEAR)$. Then enter the symbolic representation for the function.

Graphing a Function

To graph a function such as $f(x) = x^2 - 4$, start by pressing $(Y=)$ and then enter $Y_1 = X^2 - 4$. If there is an equation already entered, remove it by pressing $(CLEAR)$. The equals sign in “ $Y_1 =$ ” should be in reverse video (a dark rectangle surrounding a white equals sign), which indicates that the equation will be graphed. If the equals sign is not in reverse video, place the cursor over it and press $(ENTER)$. Set an appropriate viewing rectangle and then press $(GRAPH)$. The graph of f will appear in the specified viewing rectangle. See Figures A.14 and A.15.

NOTE If the error message “ERR: DIM MISMATCH” appears when you try to graph a function, check to see if one of the STATPLOTS is turned on. If it is, turn it off and then try graphing the function.

Summary: Graphing a Function

Use the $(Y=)$ menu to enter the formula for the function and the $(WINDOW)$ menu to set an appropriate viewing rectangle. Then press $(GRAPH)$.

Figure A.14

$[-10, 10, 1]$ by $[-10, 10, 1]$

Figure A.15

ZoomFit The ZoomFit feature can be used to find an appropriate window when graphing a function. ZoomFit leaves the current Xmin and Xmax settings unchanged and adjusts the current Ymin and Ymax values so that they are equal to the smallest and largest y -values on the graph of the function between Xmin and Xmax. To use ZoomFit, press $(ZOOM)$ (0) .

Evaluating a Function Graphically

In Example 7, Section 1.3, we are asked to evaluate the function $f(x) = 0.72x + 2$ graphically at $x = 65$. Begin by entering the formula $Y_1 = .72X + 2$ into the $(Y=)$ menu. Then graph f in the appropriate viewing rectangle, as shown in Figure 1.49. To evaluate $f(65)$, use the following keystrokes, which access the CALCULATE menu.

$(2nd)$ $(TRACE)$ $(CALC)$ (1) (6) (5) $(ENTER)$

See Figures 1.50 and 1.51.

Summary: Evaluating a Function Graphically

To evaluate a function graphically, begin by graphing the function. Then use the following keystrokes to use the value routine in the CALCULATE menu.

2nd **TRACE [CALC]** **1**

Then enter the x -value where the function should be evaluated and press **ENTER**. The x -value must be between X_{\min} and X_{\max} .

Making a Table

In Example 7, Section 1.3, a table of values is requested. Start by pressing **Y=** and then entering the formula $Y_1 = .72X + 2$, as shown in Figure A.16. To set the table parameters, use the following keystrokes. (See Figure A.17.)

2nd **WINDOW [TBLSET]** **6** **0** **ENTER** **1**

These keystrokes specify a table that starts at $x = 60$ and increments the x -values by 1. Therefore the values of Y_1 at $x = 60, 61, 62, \dots$ appear in the table. To create this table, press the following keys.

2nd **GRAPH [TABLE]**

One can scroll through x - and y -values by using the arrow keys. See Figure A.18. Note that there is no first or last x -value in the table.

Summary: Making a Table of a Function

Enter the formula for the function using **Y=**. Then press

2nd **WINDOW [TBLSET]**

to set the starting x -value and the increment between x -values appearing in the table. Create the table by pressing

2nd **GRAPH [TABLE]**.

Figure A.19

Squaring a Viewing Rectangle

In a square viewing rectangle, the graph of $y = x$ is a line that makes a 45° angle with the positive x -axis, a circle appears circular, and all sides of a square have the same length. An approximately square viewing rectangle can be set if the distance along the x -axis is 1.5 times the distance along the y -axis. Examples of viewing rectangles that are (approximately) square include

$[-6, 6, 1]$ by $[-4, 4, 1]$ and $[-9, 9, 1]$ by $[-6, 6, 1]$.

Square viewing rectangles can be set automatically by pressing either

ZOOM **4** or **ZOOM** **5**.

ZOOM 4 provides a decimal window, which is discussed later. See Figure A.19.

Summary: Squaring a Viewing Rectangle

Either ZOOM 4 or ZOOM 5 may be used to produce a square viewing rectangle. An (approximately) square viewing rectangle has the form

$$[-1.5k, 1.5k, 1] \text{ by } [-k, k, 1],$$

where k is a positive number.

Plotting Data and an Equation

In Example 4, Section 2.1, we are asked to plot data and graph a modeling function in the same xy -plane. (You may want to refer to the subsection on making a scatterplot and line graph in this appendix.) Start by entering the x -values into list L1 and the y -values into list L2, as shown in Figure A.20. Then press Y= and enter the formula $Y_1 = .65X$ for $f(x)$. Make sure that STATPLOT is on, and set an appropriate viewing rectangle. See Figures A.21 and A.22, and note that Figure A.21 shows “Plot1” in reverse video, which indicates that the scatterplot is on. Now press GRAPH to have both the scatterplot and the graph of Y_1 appear in the same viewing rectangle, as shown in Figure A.23.

L1	L2	L3	1
240	150	-----	
360	230		
680	435		
800	510		
-----	-----

Figure A.23

Summary: Plotting Data and an Equation

- STEP 1: Enter the x -values into list L1 and the y -values into list L2 using the STAT EDIT menu. Turn on Plot1 so that the scatterplot appears.
- STEP 2: Use the Y= menu to enter the equation to be graphed.
- STEP 3: Use WINDOW or ZOOM to set an appropriate viewing rectangle.
- STEP 4: Press GRAPH to graph both the scatterplot and the equation in the same viewing rectangle.

Accessing the Greatest Integer Function

To access the greatest integer function, enter the following keystrokes from the home screen.

MATH > 5

See Figure A.24.

Summary: Accessing the Greatest Integer Function

- STEP 1: Press MATH .
- STEP 2: Position the cursor over “NUM”.
- STEP 3: Press 5 to select the greatest integer function, which is denoted “int”.

MATH	NUM	CPX	PRB
1:abs(
2:round(
3:iPart(
4:fPart(
5:int(
6:min(
7:max(

Figure A.24

Figure A.25

Setting Connected and Dot Mode

In Figure 2.10 of Section 2.1 a form of the greatest integer function is graphed in dot mode, and in Figure 2.11 it is graphed in connected mode. To set your graphing calculator in dot mode, press **(MODE)**, position the cursor over “Dot”, and press **(ENTER)**. See Figure A.25. Graphs will now appear in dot mode rather than connected mode.

Summary: Setting Connected or Dot Mode

- STEP 1:** Press **(MODE)**.
- STEP 2:** Position the cursor over “Connected” or “Dot”. Press **(ENTER)**.

LinReg(ax+b)

Figure A.26

Figure A.27

DiagnosticOn Done

Figure A.28

Figure A.29

Finding the Line of Least-Squares Fit

In Example 7, Section 2.1, the line of least-squares fit for the points (1, 1), (2, 3), and (3, 4) is found. Begin by entering the points in the same way as for a scatterplot. See Figure 2.12, where the x -values are in list L1 and the y -values are in list L2.

After the data have been entered, perform the following keystrokes from the home screen.

(CLEAR) **(STAT)** **(>)** **(4)**

(See Figure 2.13.) This causes “LinReg(ax+b)” to appear on the home screen, as shown in Figure A.26. The graphing calculator assumes that the x -values are in list L1 and the y -values are in list L2. Now press **(ENTER)**. The result is shown in Figure 2.14.

If the correlation coefficient r does not appear, enter the keystrokes

(2nd) **(0 [CATALOG])**

and scroll down until you find “DiagnosticsOn”. Press **(ENTER)** twice. See Figures A.27 and A.28. The graphs of the data and the least-squares regression line are shown in Figure 2.15.

Summary: Linear Least-Squares Fit

- STEP 1:** Enter the data using **(STAT)** **(1)**, as is done for a scatterplot. Input the x -values into list L1 and the y -values into list L2.
- STEP 2:** Press **(STAT)** **(>)** **(4)** from the home screen to access the least-squares regression line. Press **(ENTER)** to start the computation. See page AP-13 to learn how to copy a regression equation into Y_1 .

Locating a Point of Intersection

In Example 7, Section 2.3, we are asked to find the point of intersection for two lines. To find the point of intersection for the graphs of

$$f(x) = 5.91x + 13.7 \quad \text{and} \quad g(x) = -4.71x + 64.7,$$

start by entering Y_1 and Y_2 , as shown in Figure A.29. Set the viewing rectangle to $[0, 12, 2]$ by $[0, 100, 10]$, and graph both equations in the same viewing rectangle, as shown in Figure 2.35. Then press the following keys to find the intersection point.

(2nd) **(TRACE [CALC])** **(5)**

CALCULATE

1:value
2:zero
3:minimum
4:maximum

Figure A.32

CALCULATE

1:value
2:zero
3:minimum
4:maximum
5:intersect
6:dy/dx
7:f(x)dx

Figure A.33

See Figure A.30, where the intersect utility is being selected. The calculator prompts for the first curve, as shown in Figure A.31. Use the arrow keys to locate the cursor near the point of intersection and press **(ENTER)**. Repeat these steps for the second curve, as shown in Figure A.32. Finally the calculator prompts for a guess. For each of the three prompts, place the free-moving cursor near the point of intersection and press **(ENTER)**. The approximate coordinates of the point of intersection are shown in Figure 2.36.

Summary: Finding a Point of Intersection

STEP 1: Graph the two functions in an appropriate viewing rectangle.

STEP 2: Press **(2nd) (TRACE [CALC]) (5)**.

STEP 3: Use the arrow keys to select an approximate location for the point of intersection. Press **(ENTER)** to make the three selections for "First curve?", "Second curve?", and "Guess?". (If the cursor is near the point of intersection, you usually do not need to move the cursor for each selection. Just press **(ENTER)** three times.)

Locating a Zero of a Function

In Example 4, Section 2.4, we are asked to locate an x -intercept, or *zero*, of the function f given by $f(x) = 1 - x - (\frac{1}{2}x - 2)$. Start by entering $Y_1 = 1 - X - (X/2 - 2)$ into the **(Y=)** menu. Set the viewing rectangle to $[-6, 6, 1]$ by $[-4, 4, 1]$ and graph Y_1 . Afterwards, press the following keys to invoke the zero finder. (See Figure A.33.)

(2nd) (TRACE [CALC]) (2)

The calculator prompts for a left bound. Use the arrow keys to set the cursor to the left of the x -intercept and press **(ENTER)**. The calculator then prompts for a right bound. Set the cursor to the right of the x -intercept and press **(ENTER)**. Finally the calculator prompts for a guess. Set the cursor roughly at the x -intercept and press **(ENTER)**. See Figures A.34–A.36. The calculator then approximates the x -intercept, or zero, automatically, as shown in Figure 2.48.

[-6, 6, 1] by [-4, 4, 1]

Figure A.34

$[-4.7, 4.7, 1]$ by $[-3.1, 3.1, 1]$

Figure A.41

Accessing the Absolute Value

In Example 1, Section 2.5, the absolute value is used to graph $f(x) = |x + 2|$. To graph f , begin by entering $Y_1 = \text{abs}(X + 2)$. The absolute value (abs) is accessed by pressing

MATH \triangleright **1**.

See Figure A.37.

Summary: Accessing the Absolute Value

- STEP 1:** Press **MATH**.
- STEP 2:** Position the cursor over “NUM”.
- STEP 3:** Press **1** to select the absolute value.

Finding Extrema (Minima and Maxima)

In Example 6, Section 3.1, we are asked to find a minimum point (or vertex) on the graph of $f(x) = 1.5x^2 - 6x + 4$. Start by entering $Y_1 = 1.5X^2 - 6X + 4$ into the **Y=** menu. Set the viewing rectangle to $[-4.7, 4.7, 1]$ by $[-3.1, 3.1, 1]$ by entering **ZOOM** **4**. Then perform the following keystrokes to find the minimum y -value.

2nd **TRACE [CALC]** **3**

See Figure A.38.

The calculator prompts for a left bound. Use the arrow keys to position the cursor to the left of the vertex and press **ENTER**. Similarly, position the cursor to the right of the vertex for the right bound and press **ENTER**. Finally the calculator asks for a guess between the left and right bounds. Place the cursor near the minimum point and press **ENTER**. See Figures A.39–A.41. The minimum point (or vertex) is shown in Figure 3.14.

To find a maximum of the function f on an interval, use a similar approach, except enter

2nd **TRACE [CALC]** **4**.

The calculator prompts for left and right bounds, followed by a guess. Press **ENTER** after the cursor has been located appropriately for each prompt. An example of a maximum point is displayed in Figure 3.20.

Summary: Finding Extrema (Maxima and Minima)

- STEP 1:** Graph the function in an appropriate viewing rectangle.
- STEP 2:** Press **2nd** **TRACE [CALC]** **3** to find a minimum point or **2nd** **TRACE [CALC]** **4** to find a maximum point.
- STEP 3:** Use the arrow keys to locate the left and right x -bounds, followed by a guess. Press **ENTER** to select each position of the cursor.

Using the Ask Table Feature

In Example 11, Section 3.1, a table with x -values of 0, 2, 4, 6, and 8 is created. Start by entering $Y_1 = 1.875(X - 8)^2 + 80$. To obtain the table shown in Figure 3.23, use the Ask feature rather than the Auto feature for the independent variable (Indpnt:). Press **2nd**

TABLE SETUP

(GRAPH [TABLE]). Whenever an x -value is entered, the corresponding y -value is calculated automatically. See Figures A.42 and A.43.

Summary: Using the Ask Feature for a Table

- STEP 1:** Enter the formula for $f(x)$ into Y_1 by using the (Y=) menu.
- STEP 2:** Press (2nd) (WINDOW [TBLSET]) to access “TABLE SETUP” and then select “Ask” for the independent variable (Indpnt:). “TblStart” and “ Δ Tbl” do not need to be set.
- STEP 3:** Enter x -values of your choice. The corresponding y -values will be calculated automatically.

Finding a Nonlinear Function of Least-Squares Fit

In Example 12, Section 3.1, a quadratic function of least-squares fit is found in a manner similar to the way a linear function of least-squares fit is found. To solve Example 12, start by pressing (STAT) (1) and then enter the data points from Table 3.4, as shown in Figure 3.25. Input the x -values into list L1 and the y -values into list L2. To find the equation for a quadratic polynomial of least-squares fit, perform the following keystrokes from the home screen.

(CLEAR) (STAT) (▶) (5)

This causes “Quadreg” to appear on the home screen. The calculator assumes that the x -values are in list L1 and the y -values are in list L2, unless otherwise designated. Press (ENTER) to obtain the quadratic regression equation, as shown in Figure 3.27. Graphs of the data and the regression equation are shown in Figure 3.28.

Other types of regression equations, such as cubic, quartic, power, and exponential, can be selected from the STAT CALC menu. See Figure A.44.

Summary: Nonlinear Least-Squares Fit

- STEP 1:** Enter the data using (STAT) (1). Input the x -values into list L1 and the y -values into list L2, as is done for a scatterplot.
- STEP 2:** From the home screen, press (STAT) (▶) and select a type of least-squares modeling function from the menu. Press (ENTER) to initiate the computation.

Evaluating Complex Arithmetic

Complex arithmetic can be performed in much the same way as other arithmetic expressions are evaluated. The imaginary unit i is obtained by entering

(2nd) (i)

from the home screen. For example, to add the numbers $(-2 + 3i) + (4 - 6i)$, perform the following keystrokes on the home screen.

(() (-) 2) + 3 (2nd) (i)) + (() 4 - 6 (2nd) (i))) (ENTER)

The result is shown in the first two lines of Figure 3.48 in Section 3.3. Other complex arithmetic operations are done similarly.

Summary: Evaluating Complex Arithmetic

Enter a complex expression in the same way as any other arithmetic expression. To obtain the complex number i , use $(2\text{nd}) \text{ (i)}$.

Figure A.48

Accessing the Variable Y_1

In Figure 3.94, Section 3.5, the expressions $-Y_1$ and $Y_1(-X)$ in the $(Y=)$ menu are used to graph reflections. The Y_1 variable can be found by pressing the following keys. (See Figures A.45 and A.46.)

$(\text{VARs}) \text{ (}\blacktriangleright\text{) (1) (1)}$

Summary: Accessing the Variable Y_1

STEP 1: Press (VARs) .

STEP 2: Position the cursor over "Y-VARS".

STEP 3: Press (1) twice.

These keystrokes will make Y_1 appear on the screen.

Shading between Two Graphs

In Example 8, Section 3.5, the region below the graph of $f(x) = -0.4x^2 + 4$ is shaded to make it look like a mountain, as illustrated in Figure 3.113. One way to shade below the graph of f is to begin by entering $Y_1 = -.4X^2 + 4$ after pressing $(Y=)$. Then use the following keystrokes from the home screen.

$(2\text{nd}) \text{ (PRGM [DRAW]) (7) (-) (5) (,) (VARs) (}\blacktriangleright\text{) (1) (1) (})$

The expression $\text{Shade}(-5, Y_1)$ should appear on your home screen. See Figures A.47 and A.48. The shading utility, accessed from the DRAW menu, requires a lower function and then an upper function, separated by a comma. When (ENTER) is pressed, the graphing calculator shades between the graph of the lower function and the graph of the upper function. For the lower function we have arbitrarily selected $y = -5$ because its graph lies below the graph of f and does not appear in the viewing rectangle in Figure 3.113. Instead of entering the variable Y_1 , we could enter the formula $-.4X^2 + 4$ for the upper function.

Summary: Shading a Graph

STEP 1: Press $(2\text{nd}) \text{ (PRGM [DRAW]) (7)}$ from the home screen.

STEP 2: Enter a formula or a variable such as Y_1 for the lower function, followed by a comma.

STEP 3: Enter a formula or a variable such as Y_2 for the upper function, followed by a right parenthesis.

STEP 4: Set an appropriate viewing rectangle.

STEP 5: Press (ENTER) . The region between the two graphs will be shaded.

Figure A.53

Copying a Regression Equation into $Y_1 =$

In Example 7, Section 4.2, we are asked to use cubic regression to model real data. The resulting formula for the cubic function, shown in Figure 4.53, is quite complicated and tedious to enter into $Y_1 =$ by hand. A graphing calculator has the capability to copy this equation into Y_1 automatically. To do this, clear the equation for $Y_1 =$. Then enter Y_1 after “CubicReg”, as shown in Figure A.49. When ENTER is pressed, the regression equation will be calculated and then copied into $Y_1 =$, as shown in Figure A.50. The following keystrokes may be used from the home screen. (Be sure to enter the data into lists L1 and L2.)

$\text{STAT} \rightarrow 6 \text{ VARS} \rightarrow 1 \text{ ENTER}$

Summary: Copying a Regression Equation into $Y_1 =$

STEP 1: Clear Y_1 in the Y= menu if an equation is present. Return to the home screen.

STEP 2: Select a type of regression from the STAT CALC menu.

STEP 3: Press $\text{VAR} \rightarrow 1 \text{ ENTER}$.

Setting a Decimal Window

In Example 1, Section 4.7, a decimal (or friendly) window is used to trace the graph of f . With a decimal window, the cursor stops on convenient x -values. In the decimal window $[-9.4, 9.4, 1]$ by $[-6.2, 6.2, 1]$, the cursor stops on x -values that are multiples of 0.2. If we reduce the viewing rectangle to $[-4.7, 4.7, 1]$ by $[-3.1, 3.1, 1]$, the cursor stops on x -values that are multiples of 0.1. To set this smaller window automatically, press $\text{ZOOM} \rightarrow 4$. See Figure A.51. Decimal windows are useful when graphing rational functions with asymptotes in connected mode.

Summary: Setting a Decimal Window

Press $\text{ZOOM} \rightarrow 4$ to set the viewing rectangle $[-4.7, 4.7, 1]$ by $[-3.1, 3.1, 1]$. A convenient larger decimal window is $[-9.4, 9.4, 1]$ by $[-6.2, 6.2, 1]$.

Graphing an Inverse Function

In Example 7, Section 5.2, the inverse function of $f(x) = x^3 + 2$ is graphed. A graphing calculator can graph the inverse of a function without a formula for $f^{-1}(x)$. Begin by entering $Y_1 = X^3 + 2$ into the Y= menu. Then return to the home screen by pressing

$2\text{nd} \text{ MODE [QUIT]}$.

The DrawInv utility may be accessed by pressing

$2\text{nd} \text{ PRGM [DRAW]} \rightarrow 8$,

followed by

$\text{VAR} \rightarrow 1 \text{ ENTER}$

to obtain the variable Y_1 . See Figure A.52. Pressing ENTER causes both Y_1 and its inverse to be graphed, as shown in Figure A.53.

Summary: Graphing an Inverse Function

- STEP 1: Enter the formula for $f(x)$ into Y_1 using the $(Y=)$ menu.
- STEP 2: Set an appropriate viewing rectangle by pressing (WINDOW) .
- STEP 3: Return to the home screen by pressing $(2\text{nd}) (\text{MODE [QUIT]})$.
- STEP 4: Press $(2\text{nd}) (\text{PRGM [DRAW]}) (8) (\text{VAR}) (\text{>}) (1) (1) (\text{ENTER})$ to create the graphs of f and f^{-1} .

Shade(Y_2, Y_1)

Figure A.54

$[-6, 6, 1]$ by $[-6, 6, 1]$

Figure A.55

Shading a System of Inequalities

In Example 2(b), Section 9.2, we are asked to shade the solution set for the system of linear inequalities $x + 3y \leq 9$, $2x - y \leq -1$. Begin by solving each system for y to obtain $y \leq (9 - x)/3$ and $y \geq 2x + 1$. Then let $Y_1 = (9 - X)/3$ and $Y_2 = 2X + 1$, as shown in Figure 9.34. Position the cursor to left of Y_1 and press (ENTER) three times. The triangle that appears indicates that the calculator will shade the region below the graph of Y_1 . Next locate the cursor to the left of Y_2 and press (ENTER) twice. This triangle indicates that the calculator will shade the region above the graph of Y_2 . After setting the viewing rectangle to $[-6, 6, 1]$ by $[-6, 6, 1]$, press (GRAPH) . The result is shown in Figure 9.35. The solution set could also be shaded using $\text{Shade}(Y_2, Y_1)$ from the home screen. See Figures A.54 and A.55.

Summary: Shading a System of Equations

- STEP 1: Solve each inequality for y .
- STEP 2: Enter the formulas as Y_1 and Y_2 in the $(Y=)$ menu.
- STEP 3: Locate the cursor to the left of Y_1 and press (ENTER) two or three times, to shade either above or below the graph of Y_1 . Repeat for Y_2 .
- STEP 4: Set an appropriate viewing rectangle.
- STEP 5: Press (GRAPH) .

Note: The Shade utility under the DRAW menu can also be used to shade the region between two graphs.

Entering the Elements of a Matrix

In Example 9, Section 9.4, the augmented matrix A is given by

$$A = \left[\begin{array}{ccc|c} 2 & 1 & 2 & 10 \\ 1 & 0 & 2 & 5 \\ 1 & -2 & 2 & 1 \end{array} \right]$$

On the TI-83 Plus and TI-84 Plus, use the following keystrokes to define a matrix A with dimension 3×4 . (On the TI-83 graphing calculator, the matrix menu is found by pressing (MATRIX) .)

$(2\text{nd}) (x^{-1} [\text{MATRIX}]) (\text{>}) (\text{>}) (1) (3) (\text{ENTER}) (4) (\text{ENTER})$

See Figures 9.45 and 9.46. Then input the 12 elements of the matrix A , row by row, as shown in Figure 9.46. Finish each entry by pressing $\boxed{\text{ENTER}}$. After these elements have been entered, press

$\boxed{2\text{nd}} \boxed{\text{MODE [QUIT]}}$

to return to the home screen. To display the matrix A , press

$\boxed{2\text{nd}} \boxed{x^{-1} [\text{MATRIX}]} \boxed{1} \boxed{\text{ENTER}}$.

See Figure 9.47.

Summary: Entering the Elements of a Matrix A

STEP 1: Begin by accessing the matrix A by pressing $\boxed{2\text{nd}} \boxed{x^{-1} [\text{MATRIX}]} \boxed{\triangleright} \boxed{\triangleright} \boxed{1}$.

STEP 2: Enter the dimension of A by pressing $\boxed{m} \boxed{\text{ENTER}} \boxed{n} \boxed{\text{ENTER}}$, where the dimension of the matrix is $m \times n$.

STEP 3: Input each element of the matrix, row by row. Finish each entry by pressing $\boxed{\text{ENTER}}$. Use $\boxed{2\text{nd}} \boxed{\text{MODE [QUIT]}}$ to return to the home screen.

Note: On the TI-83, replace the keystrokes $\boxed{2\text{nd}} \boxed{x^{-1} [\text{MATRIX}]}$ with $\boxed{\text{MATRIX}}$.

Reduced Row-Echelon Form

In Example 9, Section 9.4, the reduced row-echelon form of a matrix is found. To find this reduced row-echelon form on the TI-83 Plus and TI-84 Plus, use the following keystrokes from the home screen.

$\boxed{2\text{nd}} \boxed{x^{-1} [\text{MATRIX}]} \boxed{\triangleright} \boxed{\text{ALPHA}} \boxed{\text{APPS [B]}} \boxed{2\text{nd}} \boxed{x^{-1} [\text{MATRIX}]} \boxed{1} \boxed{)} \boxed{\text{ENTER}}$

The resulting matrix is shown in Figure 9.49. On the TI-83 graphing calculator, use the following keystrokes to find the reduced row-echelon form.

$\boxed{\text{MATRIX}} \boxed{\triangleright} \boxed{\text{ALPHA}} \boxed{\text{MATRIX [B]}} \boxed{\text{MATRIX}} \boxed{1} \boxed{)} \boxed{\text{ENTER}}$

Summary: Finding the Reduced Row-Echelon Form of a Matrix

STEP 1: To make $\text{rref}([A])$ appear on the home screen, use the following keystrokes.

$\boxed{2\text{nd}} \boxed{x^{-1} [\text{MATRIX}]} \boxed{\triangleright} \boxed{\text{ALPHA}} \boxed{\text{APPS [B]}} \boxed{2\text{nd}} \boxed{x^{-1} [\text{MATRIX}]} \boxed{1} \boxed{)} \boxed{\text{ENTER}}$

STEP 2: Press $\boxed{\text{ENTER}}$ to calculate the reduced row-echelon form. Use arrow keys to access elements that do not appear on the screen.

Note: On the TI-83, replace the keystrokes $\boxed{2\text{nd}} \boxed{x^{-1} [\text{MATRIX}]}$ with $\boxed{\text{MATRIX}}$ and $\boxed{\text{APPS [B]}}$ with $\boxed{\text{MATRIX [B]}}$.

Performing Arithmetic Operations on Matrices

In Example 8, Section 9.5, the matrices A and B are multiplied. Begin by entering the elements for the matrices A and B . The following keystrokes can be used to define a matrix A with dimension 3×3 .

$\boxed{2\text{nd}} \boxed{x^{-1} [\text{MATRIX}]} \boxed{\triangleright} \boxed{\triangleright} \boxed{1} \boxed{3} \boxed{\text{ENTER}} \boxed{3} \boxed{\text{ENTER}}$

Next input the 9 elements in the matrix A , row by row. Finish each entry by pressing ENTER . See Figure 9.65. Repeat this process to define a matrix B with dimension 3×3 .

2nd x^{-1} [MATRIX] ▷ ▷ 2 3 ENTER 3 ENTER

Enter the 9 elements in B . See Figure 9.66. After the elements of A and B have been entered, press

2nd MODE [QUIT]

to return to the home screen. To multiply the expression AB , use the following keystrokes from the home screen.

2nd x^{-1} [MATRIX] 1 \times 2nd x^{-1} [MATRIX] 2 ENTER

The result is shown in Figure 9.67.

Summary: Performing Arithmetic Operations on Matrices

STEP 1: Enter the elements of each matrix, beginning with the keystrokes

2nd x^{-1} [MATRIX] ▷ ▷ k m ENTER n ENTER ,

where k is the menu number of the matrix and the dimension of the matrix is $m \times n$.

STEP 2: Return to the home screen by pressing 2nd MODE [QUIT] .

STEP 3: Enter the matrix expression, followed by ENTER . Use the keystrokes

2nd x^{-1} [MATRIX] k

to access the matrix with menu number k .

Note: On the TI-83, replace the keystrokes 2nd x^{-1} [MATRIX] with [MATRIX] .

MATRIX[A]	3 × 3		
[1	3	-1]
[0	-2	1]
[-1	1	-3]

Figure A.56

Finding the Inverse of a Matrix

In Example 8, Section 9.6, the inverse of A , denoted A^{-1} , is displayed in Figure 9.71. To calculate A^{-1} , start by entering the elements of the matrix A , as shown in Figure A.56. To compute A^{-1} , perform the following keystrokes from the home screen.

2nd x^{-1} [MATRIX] 1 x^{-1} ENTER

The results are shown in Figure 9.71.

Summary: Finding the Inverse of a Square Matrix

STEP 1: Enter the elements of the square matrix A .

STEP 2: Return to the home screen by pressing

2nd MODE [QUIT] .

STEP 3: Perform the following keystrokes from the home screen to display A^{-1} .

2nd x^{-1} [MATRIX] 1 x^{-1} ENTER

Note: On the TI-83, replace the keystrokes 2nd x^{-1} [MATRIX] with [MATRIX] .

Solving a Linear System with a Matrix Inverse

In Example 8, Section 9.6, the solution to a system of equations is found. The matrix equation $AX = B$ has the solution $X = A^{-1}B$, provided A^{-1} exists, and is given by

$$AX = \begin{bmatrix} 1 & 3 & -1 \\ 0 & -2 & 1 \\ -1 & 1 & -3 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 6 \\ -2 \\ 4 \end{bmatrix} = B.$$

To solve this equation, start by entering the elements of the matrices A and B . To compute the solution $A^{-1}B$, perform the following keystrokes from the home screen.

$\boxed{2\text{nd}} \boxed{x^{-1} [\text{MATRIX}]} \boxed{1} \boxed{x^{-1}} \boxed{\times} \boxed{2\text{nd}} \boxed{x^{-1} [\text{MATRIX}]} \boxed{2} \boxed{\text{ENTER}}$

The results are shown in Figure 9.72.

Summary: Solving a Linear System with a Matrix Inverse

STEP 1: Write the system of equations as $AX = B$.

STEP 2: Enter the elements of the matrices A and B .

STEP 3: Return to the home screen by pressing

$\boxed{2\text{nd}} \boxed{\text{MODE [QUIT]}}$.

STEP 4: Perform the following keystrokes.

$\boxed{2\text{nd}} \boxed{x^{-1} [\text{MATRIX}]} \boxed{1} \boxed{x^{-1}} \boxed{\times} \boxed{2\text{nd}} \boxed{x^{-1} [\text{MATRIX}]} \boxed{2} \boxed{\text{ENTER}}$

Note: On the TI-83, replace the keystrokes with $\boxed{2\text{nd}} \boxed{x^{-1} [\text{MATRIX}]} \boxed{\text{with}} \boxed{\text{MATRIX}}$.

MATRIX[A]	3 × 3
[2	-3 1]
[-2	1 0]
[0	-1 4]

Figure A.57

Evaluating a Determinant

In Example 4(a), Section 9.7, a graphing calculator is used to evaluate a determinant of a matrix. Start by entering the 9 elements of the 3×3 matrix A , as shown in Figure A.57. To compute $\det A$, perform the following keystrokes from the home screen.

$\boxed{2\text{nd}} \boxed{x^{-1} [\text{MATRIX}]} \boxed{\triangleright} \boxed{1} \boxed{2\text{nd}} \boxed{x^{-1} [\text{MATRIX}]} \boxed{1} \boxed{)} \boxed{\text{ENTER}}$

The results are shown in Figure 9.74.

Summary: Evaluating a Determinant of a Square Matrix

STEP 1: Enter the elements of the matrix A .

STEP 2: Return to the home screen by pressing

$\boxed{2\text{nd}} \boxed{\text{MODE [QUIT]}}$.

STEP 3: Perform the following keystrokes.

$\boxed{2\text{nd}} \boxed{x^{-1} [\text{MATRIX}]} \boxed{\triangleright} \boxed{1} \boxed{2\text{nd}} \boxed{x^{-1} [\text{MATRIX}]} \boxed{1} \boxed{)} \boxed{\text{ENTER}}$

Note: On the TI-83, replace the keystrokes $\boxed{2\text{nd}} \boxed{x^{-1} [\text{MATRIX}]} \boxed{\text{with}} \boxed{\text{MATRIX}}$.

Figure A.58

Figure A.59

Creating a Sequence

A graphing calculator can be used to calculate the terms of the sequence given by $f(n) = 2n - 5$ for $n = 1, 2, 3, 4$. See Example 1(a), Section 11.1. Start by setting the mode of the calculator to sequence ("Seq") using the following keystrokes. (See Figure A.58.)

MODE ∇ ∇ ∇ \triangleright \triangleright \triangleright ENTER 2nd MODE [QUIT]

Then enter the following from the home screen.

2nd [STAT [LIST]] \triangleright 5

On the home screen, "seq(" will appear, as shown in Figure A.59. This sequence utility requires that four things be entered—all separated by commas. They are the formula, the variable, the subscript of the first term, and the subscript of the last term. Use the following keystrokes to obtain the first four terms (a_1, a_2, a_3, a_4) of the sequence $a_n = 2n - 5$, as shown in Figure 11.1.

2 X, T, θ, n − 5 , X, T, θ, n , 1 , 4) ENTER

Summary: Creating a Sequence

STEP 1: To create a sequence, use the keystrokes

2nd [STAT [LIST]] \triangleright 5

STEP 2: Enter the formula, the variable, the subscript of the first term, and the subscript of the last term—all separated by commas. For example, if you want the first 10 terms ($a_1, a_2, a_3, \dots, a_{10}$) of $a_n = n^2$, enter $\text{seq}(n^2, n, 1, 10)$. Be sure to set your calculator in sequence mode.

STEP 3: Press ENTER to get the terms of the sequence to appear.

Entering, Tabling, and Graphing a Sequence

In Example 5, Section 11.1, a table and a graph of a sequence are created with a graphing calculator. The calculator should be set to sequence mode by entering the following keystrokes.

MODE ∇ ∇ ∇ \triangleright \triangleright \triangleright ENTER

To enter the formula for a sequence, press Y= . See Figure A.60. Let $n\text{Min} = 1$, since the initial value of n is equal to 1. To enter $a_n = 2.85a_{n-1} - .19a_{n-1}^2$, use the following keystrokes, after clearing out any old formula. (Notice that the graphing calculator uses u instead of a to denote a term of the sequence.)

2 . 8 5 2nd [7[u]] (X, T, θ, n − 1) − . 1 9 (X, T, θ, n − 1) ^ 2

2nd [7[u]] (X, T, θ, n − 1) ^ 2

Since $a_1 = 1$, let $u(n\text{Min}) = \{1\}$. This can be done as follows.

CLEAR 2nd (1 2nd)

See Figure A.60.

Figure A.60

TABLE SETUP
TblStart=1
 Δ Tbl=1

Depend: Auto Ask

Figure A.61

WINDOW
 n Min = 1
 n Max = 20
PlotStart = 1
PlotStep = 1
 X min = 0
 X max = 21
 \downarrow Xscl = 1

Figure A.62

To create a table for this sequence, starting with a_1 and incrementing n by 1, perform the following keystrokes.

(2nd) (WINDOW [TBLSET]) (1) (ENTER) (1) (2nd) (GRAPH [TABLE])

See Figure A.61 and Figure 11.7.

To graph the first 20 terms of this sequence, start by selecting (WINDOW). Since we want the first 20 terms plotted, let n Min = 1, n Max = 20, PlotStart = 1, and PlotStep = 1. The window can be set as [0, 21, 1] by [0, 14, 1]. See Figure A.62. To graph the sequence, press (GRAPH). The resulting graph uses dot mode and is shown in Figure 11.9.

Summary: Entering, Tabling, and Graphing a Sequence

STEP 1: Set the mode to "Seq" by using the (MODE) menu.

STEP 2: Enter the formula for the sequence by pressing (Y=).

STEP 3: To create a table of a sequence, set the start and increment values with

(2nd) (WINDOW [TBLSET])

and then press

(2nd) (GRAPH [TABLE]).

STEP 4: To graph a sequence, set the viewing rectangle by using (WINDOW) and then press (GRAPH). Be sure to use dot mode.

Summing a Series

In Example 2, Section 11.2, the sum of the series $\sum_{n=1}^{50} \left(\frac{1}{n^4}\right)$ is found by using a graphing calculator. Use the following keystrokes from the home screen.

(2nd) (STAT [LIST]) (►) (►) (5) (2nd) (STAT [LIST]) (►) (5)
(1) (÷) (X, T, θ , n) (^) (4) (,) (X, T, θ , n) (,) (1) (,) (5) (0) (}) (}) (ENTER)

The results are shown in the first three lines of Figure 11.12.

Summary: Summing a Series

STEP 1: Use (2nd) (STAT [LIST]) (►) (►) (5) to access the sum utility.

STEP 2: Use (2nd) (STAT [LIST]) (►) (5) to access the sequence utility. (To use the sequence utility, see "Creating a Sequence" in this appendix.)

Calculating Factorial Notation

In Example 4, Section 11.3, factorial notation is evaluated with a graphing calculator. The factorial utility is found under the MATH PRB menus. To calculate $8!$, use the following keystrokes from the home screen.

(8) (MATH) (►) (►) (►) (4) (ENTER)

The results are shown in the first two lines of Figure 11.15.

Summary: Calculating Factorial Notation

To calculate n factorial, use the following keystrokes.

n (MATH) \triangleright \triangleright \triangleright 4 (ENTER)

The value of n should be entered as a number, not a variable.

Calculating Permutations and Combinations

In Example 5(a), Section 11.3, the permutation $P(7, 3)$ is evaluated. To perform this calculation, use the following keystrokes from the home screen.

7 (MATH) \triangleright \triangleright \triangleright 2 3 (ENTER)

The results are shown in the first two lines of Figure 11.17.

In Example 8(a), Section 11.3, the combination $C(7, 3)$ can be calculated by using the following keystrokes.

7 (MATH) \triangleright \triangleright \triangleright 3 3 (ENTER)

The results are shown in the first two lines of Figure 11.18.

Summary: Calculating Permutations and Combinations

STEP 1: To calculate $P(n, r)$, use (MATH) and select “PRB” followed by (2).

STEP 2: To calculate $C(n, r)$, use (MATH) and select “PRB” followed by (3).

Graphing Parametric Equations

In Figure 8.68, Section 8.4, the parametric equations $x = t + 3$, $y = t^2$ for $-3 \leq t \leq 3$ are graphed. To set your graphing calculator in parametric mode, press (MODE), position the cursor over “Par”, and press (ENTER). See Figure A.63. Next Press (Y=) and enter the equations for x and y , as shown in Figure A.64.

Figure A.63

Figure A.64

To set a viewing rectangle, press (WINDOW). In addition to setting X_{\min} , X_{\max} , X_{scl} , Y_{\min} , Y_{\max} , and Y_{scl} , you must set values for T_{\min} , T_{\max} , and T_{step} . T_{\min} refers to the minimum value of t in the graph, and T_{\max} refers to the maximum value of t . It is given that $-3 \leq t \leq 3$, so it follows that $T_{\min} = -3$ and $T_{\max} = 3$. However, when an interval for t is not given, it may take a little experimentation to determine an appropriate interval for t . T_{step} represents the increment between consecutive t -values on the graph. If T_{step} is too large, the graph appears more like a line graph than a smooth curve. If T_{step}

is too small, the graphing calculator will take a long time to create the graph. Many times a reasonable value is $Tstep = 0.1$. See Figure 8.66. A parametric graph can be created by pressing **GRAPH**.

Tables for parametric equations can be created. Press

2nd **WINDOW** **[TBLSET]**

and proceed in the usual manner. Note that the variables TblStart and ΔTbl refer to t and not x . See Figure 8.67.

Summary: Graphing Parametric Equations

1. Press **MODE**, move the cursor to “Par”, and press **ENTER**.
2. Press **Y=** and enter the equations for x and y .
3. Press **WINDOW** and set the viewing rectangle. Be sure to set Tmin, Tmax, and Tstep. When in doubt, let $Tstep = 0.1$.
4. To make the graph appear, press **GRAPH**.

Graphing in Polar Coordinates

In Figure 8.97, Section 8.5, the polar equation $r = 2 + 2 \cos \theta$ for $0^\circ \leq \theta \leq 360^\circ$ is graphed. To set your graphing calculator in polar coordinate mode, press **MODE**, position the cursor over “Pol”, and press **ENTER**. See Figure A.65. Polar equations can be graphed in either degree or radian mode. To set your calculator in degree mode, position the cursor over “Degree” and press **ENTER**. See Figure A.66. Next press **Y=** and enter the equation for “ $r_1 =$ ”, as shown in Figure A.67. Note that the polar equation must be solved for the variable r .

Figure A.65

Figure A.66

Figure A.67

WINDOW
 $\theta_{min} = 0$
 $\theta_{max} = 360$
 $\theta_{step} = 7.5$
 $X_{min} = -6$
 $X_{max} = 6$
 $X_{scl} = 1$
 \downarrow $Y_{min} = -4$

Figure A.68 Degree Mode

To set a viewing rectangle, press **WINDOW**. In addition to setting X_{min} , X_{max} , X_{scl} , Y_{min} , Y_{max} , and Y_{scl} , you must set values for θ_{min} , θ_{max} , and θ_{step} . The variable θ_{min} refers to the minimum value of θ , and θ_{max} refers to the maximum value of θ . Since $\cos \theta$ is periodic with 360° , the entire graph will appear if we let $0^\circ \leq \theta \leq 360^\circ$. Let $\theta_{min} = 0$ and $\theta_{max} = 360$. The variable θ_{step} represents the increment between consecutive θ -values on the polar graph. If θ_{step} is too large, the graph appears more like a line graph than a smooth curve. If θ_{step} is too small, the graphing calculator will take a long time to create the graph. In degree mode a reasonable value for θ_{step} is 7.5° , and in radian mode a reasonable value for θ_{step} is 0.1 radian. See Figure A.68. A polar graph can be created by pressing **GRAPH**.

Tables for polar coordinates can be created. Press

$\boxed{2\text{nd}} \boxed{\text{WINDOW [TBLSET]}}$

and proceed in the usual manner. Note that the variables TblStart and ΔTbl refer to θ and not x . See Figure 8.96.

Summary: Graphing in Polar Coordinates

1. Press $\boxed{\text{MODE}}$, move the cursor to “Pol”, and press $\boxed{\text{ENTER}}$. Set the calculator to either degree or radian mode.
2. Press $\boxed{\text{Y=}}$ and enter the polar equation.
3. Press $\boxed{\text{WINDOW}}$ and set the viewing rectangle. Be sure to set θ_{\min} , θ_{\max} , and θ_{step} . When in doubt, let $\theta_{\text{step}} = 7.5$ in degree mode and $\theta_{\text{step}} = 0.1$ in radian mode.
4. To make the graph appear, press $\boxed{\text{GRAPH}}$.

Basic Functions

The following are symbolic, numerical, and graphical representations of several functions used in algebra. Their domains D and ranges R are given in interval notation.

Identity Function: $f(x) = x$

x	-2	-1	0	1	2
$y = x$	-2	-1	0	1	2

$$D = (-\infty, \infty)$$

$$R = (-\infty, \infty)$$

Absolute Value Function: $f(x) = |x|$

x	-2	-1	0	1	2
$y = x $	2	1	0	1	2

$$D = (-\infty, \infty)$$

$$R = [0, \infty)$$

Square Function: $f(x) = x^2$

x	-2	-1	0	1	2
$y = x^2$	4	1	0	1	4

$$D = (-\infty, \infty)$$

$$R = [0, \infty)$$

Cube Function: $f(x) = x^3$

x	-2	-1	0	1	2
$y = x^3$	-8	-1	0	1	8

$$D = (-\infty, \infty)$$

$$R = (-\infty, \infty)$$

Square Root Function: $f(x) = \sqrt{x}$

x	0	1	4	9
$y = \sqrt{x}$	0	1	2	3

$$D = [0, \infty)$$

$$R = [0, \infty)$$

Cube Root Function: $f(x) = \sqrt[3]{x}$

x	-8	-1	0	1	8
$y = \sqrt[3]{x}$	-2	-1	0	1	2

$$D = (-\infty, \infty)$$

$$R = (-\infty, \infty)$$

Greatest Integer Function: $f(x) = [x]$

x	-2.5	-1.5	0	1.5	2.5
$y = [x]$	-3	-2	0	1	2

Reciprocal Function: $f(x) = \frac{1}{x}$

x	-2	-1	0	1	2
$y = \frac{1}{x}$	$-\frac{1}{2}$	-1	—	1	$\frac{1}{2}$

Base-2 Exponential Function: $f(x) = 2^x$

x	-2	-1	0	1	2
$y = 2^x$	$\frac{1}{4}$	$\frac{1}{2}$	1	2	4

Natural Exponential Function: $f(x) = e^x$

x	-2	-1	0	1	2
$y = e^x$	e^{-2}	e^{-1}	1	e^1	e^2

Common Logarithmic Function: $f(x) = \log x$

$y = \csc x$	2	$\sqrt{2}$	1	$\sqrt{2}$	2

Secant Function: $f(x) = \sec x$

x	$-\frac{\pi}{3}$	$-\frac{\pi}{4}$	0	$\frac{\pi}{4}$	$\frac{\pi}{3}$
$y = \sec x$	2	$\sqrt{2}$	1	$\sqrt{2}$	2

Families of Functions

This subsection shows the formulas and graphs of some families of functions, such as linear, quadratic, and exponential functions. Notice that the appearance of the graphs of these functions depends on the value of k , m , or a .

Constant Functions: $f(x) = k$

Linear Functions: $f(x) = mx + b$

Quadratic Functions: $f(x) = ax^2 + bx + c$

Cubic Functions: $f(x) = ax^3 + bx^2 + cx + d$

Power Functions: $f(x) = x^a, x > 0$

Sinusoidal Functions: $f(x) = a \sin(b(x - c)) + d$ or $f(x) = a \cos(b(x - c)) + d$

Exponential Functions: $f(x) = Ca^x, C > 0$

Logarithmic Functions: $f(x) = \log_a x$

Appendix C: Partial Fractions

C

Decomposition of Rational Expressions

The sums of rational expressions are found by combining two or more rational expressions into one rational expression. Here, the reverse process is considered: Given one rational expression, express it as the sum of two or more rational expressions. A special type of sum of rational expressions is called the **partial fraction decomposition**; each term in the sum is a **partial fraction**. The technique of finding partial fraction decompositions is useful in calculus and can be accomplished by using the following steps.

Partial Fraction Decomposition of $\frac{f(x)}{g(x)}$

STEP 1: If $\frac{f(x)}{g(x)}$ is not a proper fraction (a fraction with the numerator of lower degree than the denominator), divide $f(x)$ by $g(x)$. For example,

$$\frac{x^4 - 3x^3 + x^2 + 5x}{x^2 + 3} = x^2 - 3x - 2 + \frac{14x + 6}{x^2 + 3}.$$

Then apply the following steps to the remainder, which is a proper fraction.

STEP 2: Factor $g(x)$ completely into factors of the form $(ax + b)^m$ or $(cx^2 + dx + e)^n$, where $cx^2 + dx + e$ is *irreducible* and m and n are positive integers.

STEP 3: (a) For each distinct linear factor $(ax + b)$, include in the decomposition the term

$$\frac{A}{ax + b}.$$

(b) For each repeated linear factor $(ax + b)^m$, include in the decomposition the terms

$$\frac{A_1}{ax + b} + \frac{A_2}{(ax + b)^2} + \cdots + \frac{A_m}{(ax + b)^m}.$$

STEP 4: (a) For each distinct quadratic factor $(cx^2 + dx + e)$, include in the decomposition the term

$$\frac{Bx + C}{cx^2 + dx + e}.$$

(b) For each repeated quadratic factor $(cx^2 + dx + e)^n$, include in the decomposition the terms

$$\frac{B_1x + C_1}{cx^2 + dx + e} + \frac{B_2x + C_2}{(cx^2 + dx + e)^2} + \cdots + \frac{B_nx + C_n}{(cx^2 + dx + e)^n}.$$

STEP 5: Use algebraic techniques to solve for the constants in the numerators.

To find the constants in Step 5, the goal is to get a system of equations with as many equations as there are unknowns in the numerators. One method for finding these equations is to substitute values for x on each side of the rational equation formed in Steps 3 and 4.

Distinct Linear Factors

EXAMPLE 1 Finding a partial fraction decomposition

Find the partial fraction decomposition of

$$\frac{2x^4 - 8x^2 + 5x - 2}{x^3 - 4x}.$$

SOLUTION The given fraction is not a proper fraction; the numerator has higher degree than the denominator. Perform the following division.

$$\begin{array}{r} 2x \\ x^3 - 4x \overline{) 2x^4 - 8x^2 + 5x - 2} \\ \underline{2x^4 - 8x^2} \\ 5x - 2 \end{array}$$

The quotient is $\frac{2x^4 - 8x^2 + 5x - 2}{x^3 - 4x} = 2x + \frac{5x - 2}{x^3 - 4x}$. Now work with the remainder fraction. Factor the denominator as $x^3 - 4x = x(x + 2)(x - 2)$. Since the factors are distinct linear factors, use Step 3(a) to write the decomposition as

$$\frac{5x - 2}{x^3 - 4x} = \frac{A}{x} + \frac{B}{x + 2} + \frac{C}{x - 2}, \quad \text{Equation 1}$$

where A , B , and C are constants that need to be found. Multiply each side of equation 1 by $x(x + 2)(x - 2)$ to get

$$5x - 2 = A(x + 2)(x - 2) + Bx(x - 2) + Cx(x + 2). \quad \text{Equation 2}$$

Equation 1 is an identity, since both sides represent the same rational expression. Thus equation 2 is also an identity. Equation 1 holds for all values of x except 0, -2 , and 2 . However, equation 2 holds for all values of x . In particular, substituting 0 for x in equation 2 gives $-2 = -4A$, so $A = \frac{1}{2}$. Similarly, choosing $x = -2$ gives $-12 = 8B$, so $B = -\frac{3}{2}$. Finally, choosing $x = 2$ gives $8 = 8C$, so $C = 1$. The remainder rational expression can be written as the sum of partial fractions

$$\frac{5x - 2}{x^3 - 4x} = \frac{1}{2x} + \frac{-3}{2(x + 2)} + \frac{1}{x - 2},$$

and the given rational expression can be written as

$$\frac{2x^4 - 8x^2 + 5x - 2}{x^3 - 4x} = 2x + \frac{1}{2x} + \frac{-3}{2(x + 2)} + \frac{1}{x - 2}.$$

Check the work by combining the terms on the right.

Now Try Exercise 11 ◀

Repeated Linear Factors

EXAMPLE 2 Finding a partial fraction decomposition

Find the partial fraction decomposition of

$$\frac{2x}{(x - 1)^3}.$$

Algebra Review

To review clearing fractions from rational equations, see chapter R (page R-35).

SOLUTION This is a proper fraction. The denominator is already factored with repeated linear factors. We write the decomposition as shown, using Step 3(b).

$$\frac{2x}{(x-1)^3} = \frac{A}{x-1} + \frac{B}{(x-1)^2} + \frac{C}{(x-1)^3}$$

We clear denominators by multiplying each side of this equation by $(x-1)^3$.

$$2x = A(x-1)^2 + B(x-1) + C$$

Substituting 1 for x leads to $C = 2$, so

$$2x = A(x-1)^2 + B(x-1) + 2. \quad \text{Equation 1}$$

We found C and we still need to find values for A and B . *Any* number can be substituted for x . For example, when we choose $x = -1$ (because it is easy to substitute), equation 1 becomes

$$-2 = 4A - 2B + 2$$

$$-4 = 4A - 2B$$

$$-2 = 2A - B. \quad \text{Equation 2}$$

Substituting 0 for x in equation 1 gives

$$0 = A - B + 2$$

$$2 = -A + B. \quad \text{Equation 3}$$

Now we solve the system of equations 2 and 3 to get $A = 0$ and $B = 2$. The partial fraction decomposition is

$$\frac{2x}{(x-1)^3} = \frac{2}{(x-1)^2} + \frac{2}{(x-1)^3}.$$

We needed three substitutions because there were three constants to evaluate: A , B , and C . To check this result, we could combine the terms on the right. **Now Try Exercise 13** ◀

Distinct Linear and Quadratic Factors

EXAMPLE 1 Finding a partial fraction decomposition

Find the partial fraction decomposition of

$$\frac{x^2 + 3x - 1}{(x+1)(x^2 + 2)}.$$

SOLUTION This denominator has distinct linear and quadratic factors, neither of which is repeated. Since $x^2 + 2$ cannot be factored, it is *irreducible*. The partial fraction decomposition is

$$\frac{x^2 + 3x - 1}{(x+1)(x^2 + 2)} = \frac{A}{x+1} + \frac{Bx + C}{x^2 + 2}.$$

Multiply each side by $(x+1)(x^2 + 2)$ to get

$$x^2 + 3x - 1 = A(x^2 + 2) + (Bx + C)(x + 1). \quad \text{Equation 1}$$

First substitute -1 for x to get

$$\begin{aligned}(-1)^2 + 3(-1) - 1 &= A((-1)^2 + 2) + 0 \\ -3 &= 3A \\ A &= -1.\end{aligned}$$

Replace A with -1 in equation 1 and substitute any value for x . If $x = 0$, then

$$\begin{aligned}0^2 + 3(0) - 1 &= -1(0^2 + 2) + (B \cdot 0 + C)(0 + 1) \\ -1 &= -2 + C \\ C &= 1.\end{aligned}$$

Now, letting $A = -1$ and $C = 1$, substitute again in equation 1, using another number for x . For $x = 1$,

$$\begin{aligned}3 &= -3 + (B + 1)(2) \\ 6 &= 2B + 2 \\ B &= 2.\end{aligned}$$

With $A = -1$, $B = 2$, and $C = 1$, the partial fraction decomposition is

$$\frac{x^2 + 3x - 1}{(x + 1)(x^2 + 2)} = \frac{-1}{x + 1} + \frac{2x + 1}{x^2 + 2}.$$

This work can be checked by combining terms on the right.

Now Try Exercise 21 ◀

For fractions with denominators that have quadratic factors, another method is often more convenient. The system of equations is formed by equating coefficients of like terms on each side of the partial fraction decomposition. For instance, in Example 3, after each side was multiplied by the common denominator, equation 1 was

$$x^2 + 3x - 1 = A(x^2 + 2) + (Bx + C)(x + 1). \quad \text{Equation 1}$$

Multiplying on the right and collecting like terms, we have

$$\begin{aligned}x^2 + 3x - 1 &= Ax^2 + 2A + Bx^2 + Bx + Cx + C \\ x^2 + 3x - 1 &= (A + B)x^2 + (B + C)x + (C + 2A).\end{aligned}$$

Now equating the coefficients of like powers of x gives three equations:

$$\begin{aligned}1 &= A + B \\ 3 &= B + C \\ -1 &= C + 2A.\end{aligned}$$

Solving this system of equations for A , B , and C would give the partial fraction decomposition. The next example uses a combination of the two methods.

Repeated Quadratic Factors

EXAMPLE 4 Finding a partial fraction decomposition

Find the partial fraction decomposition of

$$\frac{2x}{(x^2 + 1)^2(x - 1)}.$$

SOLUTION This expression has both a linear factor and a repeated quadratic factor. By Steps 3(a) and 4(b),

$$\frac{2x}{(x^2 + 1)^2(x - 1)} = \frac{Ax + B}{x^2 + 1} + \frac{Cx + D}{(x^2 + 1)^2} + \frac{E}{x - 1}.$$

Multiplying each side by $(x^2 + 1)^2(x - 1)$ leads to

$$2x = (Ax + B)(x^2 + 1)(x - 1) + (Cx + D)(x - 1) + E(x^2 + 1)^2. \quad \text{Equation 1}$$

If $x = 1$, equation 1 reduces to $2 = 4E$, or $E = \frac{1}{2}$. Substituting $\frac{1}{2}$ for E in equation 1 and combining terms on the right gives

$$\begin{aligned} 2x = & \left(A + \frac{1}{2}\right)x^4 + (-A + B)x^3 + (A - B + C + 1)x^2 \\ & + (-A + B + D - C)x + \left(-B - D + \frac{1}{2}\right). \end{aligned} \quad \text{Equation 2}$$

To get additional equations involving the unknowns, equate the coefficients of like powers of x on each side of equation 2. Setting corresponding coefficients of x^4 equal gives $0 = A + \frac{1}{2}$, or $A = -\frac{1}{2}$. From the corresponding coefficients of x^3 , $0 = -A + B$, which means that since $A = -\frac{1}{2}$, $B = -\frac{1}{2}$. From the coefficients of x^2 , $0 = A - B + C + 1$. Since $A = -\frac{1}{2}$ and $B = -\frac{1}{2}$, it follows that $C = -1$. Finally, from the coefficients of x , $2 = -A + B + D - C$. Substituting for A , B , and C gives $D = 1$. With

$$A = -\frac{1}{2}, \quad B = -\frac{1}{2}, \quad C = -1, \quad D = 1, \quad \text{and} \quad E = \frac{1}{2},$$

the given fraction has the partial fraction decomposition

$$\frac{2x}{(x^2 + 1)^2(x - 1)} = \frac{-\frac{1}{2}x - \frac{1}{2}}{x^2 + 1} + \frac{-x + 1}{(x^2 + 1)^2} + \frac{\frac{1}{2}}{x - 1},$$

or

$$\frac{2x}{(x^2 + 1)^2(x - 1)} = \frac{-(x + 1)}{2(x^2 + 1)} + \frac{-x + 1}{(x^2 + 1)^2} + \frac{1}{2(x - 1)}.$$

Now Try Exercise 25

In summary, to solve for the constants in the numerators of a partial fraction decomposition, use either of the following methods or a combination of the two.

Techniques for Decomposition into Partial Fractions

Method 1 for Linear Factors

STEP 1: Multiply each side of the rational expression by the common denominator.

STEP 2: Substitute the zero of each factor in the resulting equation. For repeated linear factors, substitute as many other numbers as necessary to find all the constants in the numerators. The number of substitutions required will equal the number of constants.

Method 2 for Quadratic Factors

STEP 1: Multiply each side of the rational expression by the common denominator.

STEP 2: Collect terms on the right side of the resulting equation.

STEP 3: Equate the coefficients of like terms to get a system of equations.

STEP 4: Solve the system to find the constants in the numerators.

Appendix D: Rotation of Axes

D

Figure D.1

Derivation of Rotation Equations

If we begin with an xy -coordinate system having origin O and rotate the axes about O through an angle θ , the new coordinate system is called a **rotation** of the xy -system. Trigonometric identities can be used to obtain equations for converting the coordinates of a point from the xy -system to the rotated $x'y'$ -system. Let P be any point other than the origin, with coordinates (x, y) in the xy -system and (x', y') in the $x'y'$ -system. See Figure D.1. Let $OP = r$, and let α represent the angle made by OP and the x' -axis. As shown in Figure D.1,

$$\cos(\theta + \alpha) = \frac{OA}{r} = \frac{x}{r}, \quad \sin(\theta + \alpha) = \frac{AP}{r} = \frac{y}{r},$$

$$\cos \alpha = \frac{OB}{r} = \frac{x'}{r}, \quad \sin \alpha = \frac{BP}{r} = \frac{y'}{r}.$$

These four statements can be rewritten as

$$x = r \cos(\theta + \alpha), \quad y = r \sin(\theta + \alpha), \quad x' = r \cos \alpha, \quad y' = r \sin \alpha.$$

Using the trigonometric identity for the cosine of the sum of two angles gives

$$\begin{aligned} x &= r \cos(\theta + \alpha) \\ &= r(\cos \theta \cos \alpha - \sin \theta \sin \alpha) \\ &= (r \cos \alpha) \cos \theta - (r \sin \alpha) \sin \theta \\ &= x' \cos \theta - y' \sin \theta. \end{aligned}$$

Using the identity for the sine of the sum of two angles in the same way gives $y = x' \sin \theta + y' \cos \theta$. This proves the following result.

Rotation Equations

If the rectangular coordinate axes are rotated about the origin through an angle θ and if the coordinates of a point P are (x, y) and (x', y') with respect to the xy -system and the $x'y'$ -system, respectively, then the **rotation equations** are

$$x = x' \cos \theta - y' \sin \theta \quad \text{and} \quad y = x' \sin \theta + y' \cos \theta.$$

Applying a Rotation Equation

EXAMPLE 1 Finding an equation after a rotation

The equation of a curve is $x^2 + y^2 + 2xy + 2\sqrt{2}x - 2\sqrt{2}y = 0$. Find the resulting equation if the axes are rotated 45° . Graph the equation.

SOLUTION If $\theta = 45^\circ$, then $\sin \theta = \frac{\sqrt{2}}{2}$ and $\cos \theta = \frac{\sqrt{2}}{2}$, and the rotation equations become

$$x = \frac{\sqrt{2}}{2}x' - \frac{\sqrt{2}}{2}y' \quad \text{and} \quad y = \frac{\sqrt{2}}{2}x' + \frac{\sqrt{2}}{2}y'.$$

Substituting these values into the given equation yields

$$\begin{aligned} x^2 + y^2 + 2xy + 2\sqrt{2}x - 2\sqrt{2}y &= 0 \\ \left(\frac{\sqrt{2}}{2}x' - \frac{\sqrt{2}}{2}y'\right)^2 + \left(\frac{\sqrt{2}}{2}x' + \frac{\sqrt{2}}{2}y'\right)^2 \\ &+ 2\left(\frac{\sqrt{2}}{2}x' - \frac{\sqrt{2}}{2}y'\right)\left(\frac{\sqrt{2}}{2}x' + \frac{\sqrt{2}}{2}y'\right) \\ &+ 2\sqrt{2}\left(\frac{\sqrt{2}}{2}x' - \frac{\sqrt{2}}{2}y'\right) - 2\sqrt{2}\left(\frac{\sqrt{2}}{2}x' + \frac{\sqrt{2}}{2}y'\right) = 0. \end{aligned}$$

Expanding these terms yields

$$\begin{aligned} \frac{1}{2}x'^2 - x'y' + \frac{1}{2}y'^2 + \frac{1}{2}x'^2 + x'y' + \frac{1}{2}y'^2 + x'^2 - y'^2 \\ + 2x' - 2y' - 2x' - 2y' = 0. \end{aligned}$$

Collecting terms gives

$$2x'^2 - 4y' = 0$$

$$x'^2 - 2y' = 0$$

Divide by 2.

or, finally,

$$x'^2 = 2y',$$

the equation of a parabola. The graph is shown in Figure D.2.

Now Try Exercise 13 ◀

Figure D.2

We have graphed equations written in the form $Ax^2 + Cy^2 + Dx + Ey + F = 0$. As we saw in the preceding example, the rotation of axes eliminated the xy -term. Thus, to graph by hand an equation that has an xy -term, it is necessary to find an appropriate **angle of rotation** to eliminate the xy -term. The necessary angle of rotation can be determined by using the following result. The proof is quite lengthy and is not presented here.

Angle of Rotation

The xy -term is removed from the general equation

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$$

by a rotation of the axes through an angle θ , $0^\circ < \theta < 90^\circ$, where

$$\cot 2\theta = \frac{A - C}{B}.$$

This result can be used to find the appropriate angle of rotation, θ . To find the rotation equations, first find $\sin \theta$ and $\cos \theta$. The following example illustrates a way to obtain $\sin \theta$ and $\cos \theta$ from $\cot 2\theta$ without first identifying the angle θ .

EXAMPLE 3 Rotating and graphing

Rotate the axes and graph $52x^2 - 72xy + 73y^2 = 200$.

SOLUTION Here $A = 52$, $B = -72$, and $C = 73$. By substitution,

$$\cot 2\theta = \frac{52 - 73}{-72} = \frac{-21}{-72} = \frac{7}{24}.$$

To find $\sin \theta$ and $\cos \theta$, use the trigonometric identities

$$\sin \theta = \sqrt{\frac{1 - \cos 2\theta}{2}} \quad \text{and} \quad \cos \theta = \sqrt{\frac{1 + \cos 2\theta}{2}}.$$

Sketch a right triangle and label it as in Figure D.3, to see that $\cos 2\theta = \frac{7}{25}$. (Recall that in the two quadrants with which we are concerned, $0^\circ \leq 2\theta \leq 180^\circ$, cosine and cotangent have the same sign.) Then

$$\sin \theta = \sqrt{\frac{1 - \frac{7}{25}}{2}} = \sqrt{\frac{\frac{18}{25}}{2}} = \sqrt{\frac{9}{25}} = \frac{3}{5} \quad \text{and} \quad \cos \theta = \sqrt{\frac{1 + \frac{7}{25}}{2}} = \sqrt{\frac{\frac{32}{25}}{2}} = \sqrt{\frac{16}{25}} = \frac{4}{5}.$$

Use these values for $\sin \theta$ and $\cos \theta$ to obtain

$$x = \frac{4}{5}x' - \frac{3}{5}y' \quad \text{and} \quad y = \frac{3}{5}x' + \frac{4}{5}y'.$$

Substituting these expressions for x and y into the original equation yields

$$52\left(\frac{4}{5}x' - \frac{3}{5}y'\right)^2 - 72\left(\frac{4}{5}x' - \frac{3}{5}y'\right)\left(\frac{3}{5}x' + \frac{4}{5}y'\right) + 73\left(\frac{3}{5}x' + \frac{4}{5}y'\right)^2 = 200.$$

This becomes

$$52\left(\frac{16}{25}x'^2 - \frac{24}{25}x'y' + \frac{9}{25}y'^2\right) - 72\left(\frac{12}{25}x'^2 + \frac{7}{25}x'y' - \frac{12}{25}y'^2\right) + 73\left(\frac{9}{25}x'^2 + \frac{24}{25}x'y' + \frac{16}{25}y'^2\right) = 200.$$

Combining terms gives

$$25x'^2 + 100y'^2 = 200.$$

Divide each side by 200 to get

$$\frac{x'^2}{8} + \frac{y'^2}{2} = 1,$$

an equation of an ellipse having x' -intercepts $\pm\sqrt{8}$ and y' -intercepts $\pm\sqrt{2}$. The graph is shown in Figure D.4. To find θ , use the fact that

$$\frac{\sin \theta}{\cos \theta} = \frac{\frac{3}{5}}{\frac{4}{5}} = \frac{3}{4} = \tan \theta,$$

from which $\theta = \tan^{-1} \frac{3}{4} \approx 37^\circ$.

Now Try Exercise 17

Figure D.3

Figure D.4

Summary of Conics with an xy -Term

The following summary enables us to use the general equation to decide on the type of graph to expect.

Equations of Conics with xy -Term

If the general second-degree equation

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$$

has a graph, it will be one of the following:

- (a) a circle or an ellipse (or a point) if $B^2 - 4AC < 0$;
- (b) a parabola (or one line or two parallel lines) if $B^2 - 4AC = 0$;
- (c) a hyperbola (or two intersecting lines) if $B^2 - 4AC > 0$;
- (d) a straight line if $A = B = C = 0$ and $D \neq 0$ or $E \neq 0$.

D Exercises

Exercises 1–6: Use the summary in this section to predict the graph of the second-degree equation.

- $4x^2 + 3y^2 + 2xy - 5x = 8$
- $x^2 + 2xy - 3y^2 + 2y = 12$
- $2x^2 + 3xy - 4y^2 = 0$
- $x^2 - 2xy + y^2 + 4x - 8y = 0$
- $4x^2 + 4xy + y^2 + 15 = 0$
- $-x^2 + 2xy - y^2 + 16 = 0$

Exercises 7–12: Find the angle of rotation θ that will remove the xy -term in the equation.

- $2x^2 + \sqrt{3}xy + y^2 + x = 5$
- $4\sqrt{3}x^2 + xy + 3\sqrt{3}y^2 = 10$
- $3x^2 + \sqrt{3}xy + 4y^2 + 2x - 3y = 12$
- $4x^2 + 2xy + 2y^2 + x - 7 = 0$
- $x^2 - 4xy + 5y^2 = 18$
- $3\sqrt{3}x^2 - 2xy + \sqrt{3}y^2 = 25$

Exercises 13–16: Use the given angle of rotation to remove the xy -term and graph the equation.

- $x^2 - xy + y^2 = 6$; $\theta = 45^\circ$
- $2x^2 - xy + 2y^2 = 25$; $\theta = 45^\circ$

$$15. 8x^2 - 4xy + 5y^2 = 36; \sin \theta = \frac{2}{\sqrt{5}}$$

$$16. 5y^2 + 12xy = 10; \sin \theta = \frac{3}{\sqrt{13}}$$

Exercises 17–24: Remove the xy -term from the equation by performing a suitable rotation. Graph the equation.

$$17. 3x^2 - 2xy + 3y^2 = 8 \quad 18. x^2 + xy + y^2 = 3$$

$$19. x^2 - 4xy + y^2 = -5$$

$$20. x^2 + 2xy + y^2 + 4\sqrt{2}x - 4\sqrt{2}y = 0$$

$$21. 7x^2 + 6\sqrt{3}xy + 13y^2 = 64$$

$$22. 7x^2 + 2\sqrt{3}xy + 5y^2 = 24$$

$$23. 3x^2 - 2\sqrt{3}xy + y^2 - 2x - 2\sqrt{3}y = 0$$

$$24. 2x^2 + 2\sqrt{3}xy + 4y^2 = 5$$

Exercises 25–30: In the equation, remove the xy -term by rotation. Then translate the axes and sketch the graph.

$$25. x^2 + 3xy + y^2 - 5\sqrt{2}y = 15$$

$$26. x^2 - \sqrt{3}xy + 2\sqrt{3}x - 3y - 3 = 0$$

$$27. 4x^2 + 4xy + y^2 - 24x + 38y - 19 = 0$$

$$28. 12x^2 + 24xy + 19y^2 - 12x - 40y + 31 = 0$$

$$29. 16x^2 + 24xy + 9y^2 - 130x + 90y = 0$$

$$30. 9x^2 - 6xy + y^2 - 12\sqrt{10}x - 36\sqrt{10}y = 0$$

Line graph

59. Center: $(0, 0)$; radius: 5 61. Center: $(0, 0)$; radius: $\sqrt{7}$

63. Center: $(2, -3)$; radius: 3

65. Center: $(0, -1)$; radius: 10

67. $(x - 1)^2 + (y + 2)^2 = 1$

69. $(x + 2)^2 + (y - 1)^2 = 4$

71. $(x - 3)^2 + (y + 5)^2 = 64$

73. $(x - 3)^2 + y^2 = 49$ 75. $x^2 + y^2 = 10$

77. $(x + 2)^2 + (y + 3)^2 = 25$

79. x -axis: 10 ; y -axis: 10 81. x -axis: 10 ; y -axis: 5

83. x -axis: 16 ; y -axis: 5

85. b 87. a

89. $[-5, 5, 1]$ by $[-5, 5, 1]$

91. $[-100, 100, 10]$ by $[-100, 100, 10]$

93. (a) x -min: 2005 ; x -max: 2008 ; y -min: 19.7 ; y -max: 25.0

(b) $[2003, 2010, 1]$ by $[15, 30, 5]$ (answers may vary)

(c)

(d)

95. (a) x -min: 1950 ; x -max: 2000 ; y -min: 1.7 ; y -max: 5.5

(b) $[1940, 2010, 10]$ by $[0, 7, 1]$ (answers may vary)

(c)

(d)

CHECKING BASIC CONCEPTS FOR SECTIONS 1.1

AND 1.2 (p. 28)

1. (a) 9.88 (b) 1.28

3. (a) 3.485×10^8 (b) -1.2374×10^3

(c) 1.98×10^{-3}

5. $(1, \frac{5}{2})$

7. Mean = $10,762.75$; median = $12,941.5$

SECTION 1.3 (pp. 41–45)

1. $(-2, 3)$ 3. $f(7) = 8$

5.

7.

9.

11.

13.

15.

17.

19.

21. (a) $f(-2) = -8$, $f(5) = 125$

(b) All real numbers

23. (a) $f(-1)$ is undefined, $f(a+1) = \sqrt{a+1}$

(b) Nonnegative real numbers

25. (a) $f(-1) = 9$, $f(a+1) = 3 - 3a$

(b) All real numbers

27. (a) $f(6) = -7$, $f(a-1) = -7$

(b) All real numbers

29. (a) $f(4) = \frac{1}{16}$, $f(-7) = \frac{1}{49}$ (b) $x \neq 0$

31. (a) $f(4) = \frac{1}{7}$, $f(a-5) = \frac{1}{a^2 - 10a + 16}$

 (b) $x \neq 3$, $x \neq -3$

33. (a) $f(1) = 1$, $f(a+2) = \frac{1}{\sqrt{-a}}$ (b) $x < 2$

35. (a) All real numbers (b) $g(-1) = -3$; $g(2) = 3$

(c) $g(-1) = -3$; $g(2) = 3$

37. (a) All real numbers (b) $g(-1) = 1$; $g(2) = -2$

(c) $g(-1) = 1$; $g(2) = -2$

39. (a) $D = \{x | -2 \leq x \leq 2\}$

(b) $g(-1) = -2$; $g(2) = 1$

(c) $g(-1) = -2$; $g(2) = 1$

41. $D = \{x | -3 \leq x \leq 3\}$, $R = \{y | 0 \leq y \leq 3\}$; $f(0) = 3$

43. $D =$ all real numbers, $R = \{y | y \leq 2\}$; $f(0) = 2$

45. $D = \{x | x \geq -1\}$, $R = \{y | y \leq 2\}$; $f(0) = 0$

47. (a) $f(2) = 7$ (b) $f = \{(1, 7), (2, 7), (3, 8)\}$

(c) $D = \{1, 2, 3\}$, $R = \{7, 8\}$

49. (a) $[-4.7, 4.7, 1]$ by $[-3.1, 3.1, 1]$ (b) $f(2) = 1$

(c)

51. (a) $[-4.7, 4.7, 1]$ by $[-3.1, 3.1, 1]$ (b) $f(2) = 2$

 53. Verbal: Square the input x .

Graphical:

Numerical:

$[-10, 10, 1]$ by $[-10, 10, 1]$

$f(2) = 4$

55. Verbal: Multiply the input by 2, add 1, and then take the absolute value.

Graphical:

Numerical:

$[-6, 6, 1]$ by $[-4, 4, 1]$

$f(2) = 5$

 57. Verbal: Subtract x from 5.

Graphical:

Numerical:

$[-10, 10, 1]$ by $[-10, 10, 1]$

$f(2) = 3$

59. Verbal: Add 1 to the input and then take the square root of the result.

Graphical:

Numerical:

$[-6, 6, 1]$ by $[-4, 4, 1]$

$f(2) = \sqrt{3}$

61. (a) $g = \{(-1, 2), (0, 4), (1, -3), (2, 2)\}$

(b) $D = \{-1, 0, 1, 2\}$, $R = \{-3, 2, 4\}$

63. Symbolic: $f(x) = 0.50x$

Graphical:

Numerical:

Miles	1	2	3	4	5	6
Cost	0.50	1.00	1.50	2.00	2.50	3.00

65. Yes. Domain and range include all real numbers.
67. No
69. Yes. $D: \{x | -4 \leq x \leq 4\}$; $R: \{y | 0 \leq y \leq 4\}$
71. Yes. Each real number input x has exactly one cube root.
73. No. Usually, several students pass a given exam.
75. Yes, because IDs are unique.
77. No 79. Yes 81. No 83. No 85. Yes
87. No 89. Yes
91. $g(x) = 12x$; $g(10) = 120$; there are 120 inches in 10 feet.
93. $g(x) = \frac{x}{4}$; $g(10) = 2.5$; there are 2.5 dollars in 10 quarters.
95. $g(x) = 86,400x$; $g(10) = 864,000$; there are 864,000 seconds in 10 days.
97. (a) $I = \{(N, 19162), (H, 26029), (B, 41681), (M, 51316)\}$ (b) $D = \{N, H, B, M\}$,
 $R = \{19162, 26029, 41681, 51316\}$
99. $N(x) = 2200x$; $N(3) = 6600$; in 3 years the average person uses 6600 napkins.

101. Verbal: Multiply the input x by -5.8 to obtain the change in temperature.

Symbolic: $f(x) = -5.8x$.

Graphical:

Numerical:

$[0, 3, 1]$ by $[-20, 20, 5]$

45. $[0, 2.4] \cup [8.7, 14.7] \cup [21, 27], (\{x | 0 \leq x \leq 2.4 \text{ or } 8.7 \leq x \leq 14.7 \text{ or } 21 \leq x \leq 27\})$
47. From -3 to -1: 0; from 1 to 3: 0
49. From -3 to -1: 1.2; from 1 to 3: -1.2

51. (a) 3 (b)

53. 7; the slope of the line passing through $(1, f(1))$ and $(4, f(4))$ is 7.
55. 26; the slope of the line passing through $(2, f(2))$ and $(4, f(4))$ is 26.
57. 0.62; the slope of the line passing through $(1, f(1))$ and $(3, f(3))$ is approximately 0.62.
59. (a) From 1900 to 1940: 4.475; from 1940 to 1980: 11.25; from 1980 to 2006: about -10.04.
(b) From 1900 to 1940 cigarette consumption increased by 4.475 billion cigarettes per year, on average. The other rates may be interpreted similarly.
61. (a) $D(2) = 64; D(4) = 256$ (b) 96; the object's average speed from 2 to 4 seconds is 96 feet per second.

For Exercises 63–67, answers may vary.

63.

65.

67.

69. (a) 3 (b) 0 71. (a) $-2x - 2h$ (b) -2
73. (a) $2x + 2h + 1$ (b) 2
75. (a) $3x^2 + 6xh + 3h^2 + 1$ (b) $6x + 3h$
77. (a) $-x^2 - 2xh - h^2 + 2x + 2h$ (b) $-2x - h + 2$
79. (a) $2x^2 + 4xh + 2h^2 - x - h + 1$
(b) $4x + 2h - 1$
81. (a) $x^3 + 3x^2h + 3xh^2 + h^3$ (b) $3x^2 + 3hx + h^2$
83. (a) $8t^2 + 16th + 8h^2$ (b) $16t + 8h$
(c) 64.4; the average speed of the car from 4 to 4.05 seconds is 64.4 feet per second.

1.5 EXTENDED AND DISCOVERY EXERCISE (p. 67)

1. Let $t = 7$ and $h = 0$.

CHECKING BASIC CONCEPTS FOR SECTION 1.5 (p. 67)

1. (a) $(-\infty, 5]$ (b) $[1, 6)$ 3. -7

CHAPTER 1 REVIEW EXERCISES (pp. 71-74)

1. Natural number: $\sqrt{16}$; integer: $-2, 0, \sqrt{16}$;
rational number: $-2, \frac{1}{2}, 0, 1.23, \sqrt{16}$; real number:
 $-2, \frac{1}{2}, 0, 1.23, \sqrt{7}, \sqrt{16}$

15. Not a function

$[-50, 50, 10]$ by $[-50, 50, 10]$

17. 10

19. $(2, -\frac{3}{2})$ 21. Yes 23. $(x - 2)^2 + (y - 5)^2 = 17$

29.

31.

33. $f(x) = 16x$

$[0, 100, 10]$ by $[0, 1800, 300]$

x	0	25	50	75	100
$f(x)$	0	400	800	1200	1600

35. (a) $f(-8) = -2$, $f(1) = 1$ (b) All real numbers

37. (a) $f(-3) = 5$, $f(1.5) = 5$ (b) All real numbers

39. (a) $f(-10) = 97$, $f(a + 2) = a^2 + 4a + 1$

(b) All real numbers

41. (a) $f(-3) = \frac{1}{5}$, $f(a + 1) = \frac{1}{a^2 + 2a - 3}$

(b) $D = \{x | x \neq 2, x \neq -2\}$ 43. No 45. Yes

47. Yes 49. 0 51. $-\frac{3}{4}$ 53. 0 55. Linear

57. Nonlinear

59.

61. Linear, but not constant 63. 5 65. 760 seconds

67. (a) 198 feet (b) 1044 sq ft

69. (a) The data decrease rapidly, indicating a very high mortality rate during the first year.

$[-1, 5, 1]$ by $[0, 110, 10]$

(b) Yes (c) From 0 to 1: -90 ; from 1 to 2: -4 ; from 2 to 3: -3 ; from 3 to 4: -1 . During the first year the population decreased, on average, by 90 birds. The other average rates of change can be interpreted similarly.

71. (a) $[1, 5, 1]$ by $[40, 70, 5]$

Nonlinear

(b) 2.5 (c) The average rate of change in outside temperature from 1 P.M. to 4 P.M. was 2.5°F per hour. The slope of the line segment from $(1, 50.5)$ to $(4, 58)$ is 2.5.

$[1, 5, 1]$ by $[50, 63, 5]$

CHAPTER 1 EXTENDED AND DISCOVERY EXERCISES (pp. 74-75)

1. About 7.17 km

3. About 3.862

$[-3, 3, 1]$ by $[-2, 2, 1]$

5. About 4.039

$[-3, 3, 1]$ by $[-1, 3, 1]$

7. About 3.16; estimates will be less than the true value.
 9. (a) Determine the number of square miles of Earth's surface that are covered by the oceans. Then divide the total volume of the water from the ice cap by the surface area of the oceans to get the rise in sea level. (b) About 25.7 feet
 (c) Since the average elevations of Boston, New Orleans, and San Diego are all less than 25 feet, these cities would be under water without some type of dike system.
 (d) About 238 feet

CHAPTER 2: Linear Functions and Equations

SECTION 2.1 (pp. 88–95)

1. (a) $V(0) = 12.8$; $V(4) = 12.0$ (b) 12.4 million in 2002 (interpolation); 11.6 million in 2006 (extrapolation)
 (c) Interpolation was more accurate.
 3. Exactly 5. Approximately
 7. $f(x) = -\frac{1}{2}x + 3$ 9. $f(x) = 2x + 5$
 11. (a) $f(x) = \frac{x}{16}$ (b) $f(x) = 10x$
 (c) $f(x) = 0.06x + 6.50$ (d) $f(x) = 500$
 13. (a) Slope: 2; y-int: -1 ; x-int: 0.5
 (b) $f(x) = 2x - 1$ (c) 0.5 (d) Increasing
 15. (a) Slope: $-\frac{1}{3}$; y-int: 2; x-int: 6
 (b) $f(x) = -\frac{1}{3}x + 2$ (c) 6 (d) Decreasing
 17. (a) Slope: 20; y-int: -50 ; x-int: 2.5
 (b) $f(x) = 20x - 50$ (c) 2.5 (d) Increasing
 19.

Slope: 3; y-int: 2

21.

Slope: $\frac{1}{2}$; y-int: -2

23.

Slope: 0; y-int: -2

25.

Slope: $-\frac{1}{2}$; y-int: 4

27.

Slope: $\frac{1}{2}$; y-int: 0

29.

Slope: -5 ; y-int: 5

31.

Slope: 20; y-int: -10

33. $f(x) = -\frac{3}{4}x + \frac{1}{3}$ 35. $f(x) = 15x$

37. $f(x) = 0.5x + 4$ 39. 0; 0 41. $-\frac{1}{4}$; $-\frac{1}{4}$

43. -3 ; -3 45. d 47. c

49. $I(t) = 1.5t + 68$; t represents years after 2006;
 $D = \{t \mid 0 \leq t \leq 4\}$ 51. $V(t) = 32t$; t represents time in
 seconds; $D = \{t \mid 0 \leq t \leq 3\}$ 53. $P(t) = 21.5 + 0.581t$;
 t represents years after 1900; $D = \{t \mid 0 \leq t \leq 100\}$

55. (a) $W(t) = -10t + 300$ (b) 230 gal

(c) x-int: 30, the tank is empty after 30 minutes; y-int: 300,
 the tank contains 300 gallons of water initially.

(d) $D = \{t \mid 0 \leq t \leq 30\}$

57. (a) $f(x) = 4.3x + 40$ (b) 65,800,000

59. (a) $f(x) = 0.25x + 0.5$ (b) 1.125 inches

61. (a) 17; 17.2; 16.6 (b) $f(x) = 17x$

(c) The vehicle is getting 17 miles per gallon.

(d) $f(30) = 510$; the vehicle travels 510 miles on 30 gallons of gas.

63. (a) Max: 55 mi/hr; min: 30 mi/hr (b) 12 miles
 (c) $f(4) = 40$, $f(12) = 30$, $f(18) = 55$
 (d) $x = 4, 6, 8, 12$, and 16. The speed limit changes at each discontinuity.

65. (a) $P(1.5) = 0.97$, $P(3) = 1.14$; it costs \$0.97 to mail 1.5 ounces and \$1.14 to mail 3 ounces.

- (b) $D = \{x \mid 0 < x \leq 5\}$

- (c) $x = 1, 2, 3, 4$

67. (a) $f(1.5) = 30$; $f(4) = 10$

(b) $m_1 = 20$ indicates that the car is moving away from home at 20 mi/hr; $m_2 = -30$ indicates that the car is moving toward home at 30 mi/hr; $m_3 = 0$ indicates that the car is not moving; $m_4 = -10$ indicates that the car is moving toward home at 10 mi/hr. (c) The driver starts at home and drives away from home at 20 mi/hr for 2 hours until the car is 40 miles from home. The driver then travels toward home at 30 mi/hr for 1 hour until the car is 10 miles from home. Then the car does not move for 1 hour. Finally, the driver returns home in 1 hour at 10 mi/hr.

- (d) Incr: $0 \leq x \leq 2$; decr: $2 \leq x \leq 3$ or $4 \leq x \leq 5$; const: $3 \leq x \leq 4$

69. (a) $-5 \leq x \leq 5$

- (b) $f(-2) = 2$, $f(0) = 3$, $f(3) = 6$

- (c) (d) f is continuous.

71. (a) $-1 \leq x \leq 2$

- (b) $f(-2) = \text{undefined}$, $f(0) = 0$, $f(3) = \text{undefined}$

- (c) (d) f is not continuous.

73. (a) $-3 \leq x \leq 3$

- (b) $f(-2) = -2$, $f(0) = 1$, $f(3) = -1$

- (c) (d) f is not continuous.

- 75.

77. (a) $f(-3) = -10$, $f(1) = 4$, $f(2) = 4$, $f(5) = 1$

- (b) $[1, 3]$ (c) f is not continuous.

79. (a) $[-10, 10, 1]$ by $[-10, 10, 1]$

- (b) $f(-3.1) = -8$, $f(1.7) = 2$

81. (a) $[-10, 10, 1]$ by $[-10, 10, 1]$

- (b) $f(-3.1) = -7$, $f(1.7) = 3$

83. (a) $f(x) = 0.8[x/2]$ for $6 \leq x \leq 18$

- (b) $[6, 18, 1]$ by $[0, 8, 1]$

- (c) $f(8.5) = \$3.20$, $f(15.2) = \$5.60$

85. $y \approx -0.789x + 0.526$; $r \approx -0.993$

$[-3, 4, 1]$ by $[-3, 3, 1]$

87. (a) Positive (b) $y = ax + b$, where $a = 3.25$ and $b = -2.45$; $r \approx 0.9994$ (c) $y = 5.35$

89. (a) Negative (b) $y = ax + b$, where $a \approx -3.8857$ and $b \approx 9.3254$; $r \approx -0.9996$ (c) $y \approx -0.00028$
(because of rounding, answers may vary slightly)

91. (a) $[-100, 1800, 100]$ by $[-1000, 28,000, 1000]$

(b) $y = ax + b$, where $a \approx 14.680$ and $b \approx 277.82$

(c) 2500 light-years

93. (a) Positive

$[-5, 40, 5]$ by $[0, 6, 1]$

(b) $f(x) \approx 0.0854x + 2.078$

(c) The number of passenger miles increased by about 0.0854 trillion per year, on average.

$[-5, 40, 5]$ by $[0, 6, 1]$

(d) About 5.5 trillion

2.1 EXTENDED AND DISCOVERY EXERCISES (p. 95)

1. Answers will vary.

3. (a) $[1.580, 1.584, 0.001]$ by $[-6.252, -6.248, 0.001]$

(b) A linear function would be a good approximation over a small interval.

SECTION 2.2 (pp. 107–112)

1. $y = -2(x - 1) + 2$

3. $y = \frac{3}{4}(x + 3) - 1$

5. $y = -2.4(x - 4) + 5$; $y = -2.4x + 14.6$

7. $y = -\frac{1}{2}(x - 1) - 2$; $y = -\frac{1}{2}x - \frac{3}{2}$

9. $y = \frac{3}{4}(x - 4) + 0$; $y = \frac{3}{4}x - 3$

11. $y = \frac{2}{3}x - 1$ 13. $y = -\frac{3}{5}x + \frac{3}{5}$ 15. c

17. b 19. e 21. $y = 3x - 1$ 23. $y = \frac{8}{3}x - \frac{17}{3}$

25. $y = -7.8x + 5$ 27. $y = -\frac{1}{2}x + 45$

29. $y = -3x + 5$ 31. $y = \frac{3}{2}x - 6$

33. $y = \frac{5}{18}x + \frac{11}{18}$ 35. $y = 4x + 9$

37. $y = \frac{3}{2}x - 2960$ 39. $y = \frac{2}{3}x - 2.1$

41. $y = \frac{1}{2}x + 6$ 43. $y = x - 20$

45. $y = \frac{1}{2}x + \frac{9}{2}$ 47. $y = -12x - 20$

49. $x = -5$ 51. $y = 6$ 53. $x = 4$ 55. $x = 19$

57. x-int: 5; y-int: -4 59. x-int: 7; y-int: -7

61. x-int: -7; y-int: 6

63. x-int: $-\frac{7}{3}$; y-int: 7

65. x -int: 4; y -int: 2

67. x -int: $\frac{5}{8}$; y -int: -5

69. x -int: 5; y -int: 7; a and b represent the x - and y -intercepts, respectively.

71. x -int: $\frac{3}{2}$; y -int: $\frac{5}{4}$; a and b represent the x - and y -intercepts, respectively.

73. $\frac{x}{5} + \frac{y}{9} = 1$

75. (a) $y = 1.5x - 3.2$ (b) When $x = -2.7$, $y = -7.25$ (interpolation); when $x = 6.3$, $y = 6.25$ (extrapolation)

77. (a) $y = -2.1x + 105.2$ (b) When $x = -2.7$, $y = 110.87$ (extrapolation); when $x = 6.3$, $y = 91.97$ (interpolation)

79. (a) $f(x) = -108(x - 1998) + 3305$, or $f(x) = -108x + 219,089$ (answers may vary); approximate (b) 2549; the estimated value is too low; extrapolation (c) The numbers were decreasing but increased after 9/11.

81. (a) $y = \frac{12,000}{7}(x - 2003) + 25,000$, or $y = \frac{12,000}{7}(x - 2010) + 37,000$; the cost of attending a private college or university is increasing by $\frac{12,000}{7} \approx \1714 per year, on average. (b) About \$31,857; interpolation (c) $y = 1714x - 3,408,714$ (approximate)

83. (a) $y = \frac{2}{3}(x - 2002) + 1.6$; sales increased by \$0.67 billion per year, on average. (b) \$5.6 billion; extrapolation (c) $y = \frac{2}{3}x - \frac{19,996}{15}$

85. (a) [1998, 2005, 1] by [0, 10, 1]

(b) Using the first and last points gives $f(x) = 1.56(x - 1999) + 1$; the average number of worldwide spam messages daily increased by 1.56 billion per year, on average (answers may vary).

(c) About 13.5 billion

87. (a) [1997, 2005, 1] by [0, 2.2, 0.2]

(b) $f(x) = 0.1(x - 1998) + 1.4$; U.S. sales of Toyota vehicles increased by 0.1 million per year. (c) Exact

89. (a) $f(x) = 0.29x + 4200$ (b) It represents the annual fixed costs.

91. (a) [1995, 2003, 1] by [9, 13, 1]

(b) $f(x) \approx 0.4167x - 802.04$ (answers may vary)

(c) The Asian-American population increased by about 0.42 million each year, on average.

(d) $f(2008) \approx 14.62$ million

93. [0, 3, 1] by [-2, 2, 1]

(a) No, the slope is not zero. (b) The resolution of most calculator screens is not high enough to show the slight increase in the y -values.

95. (a) They do not appear to be perpendicular in the standard viewing rectangle (answers may vary for different calculators).

(b) In $[-15, 15, 1]$ by $[-10, 10, 1]$ and $[-3, 3, 1]$ by $[-2, 2, 1]$ they appear to be perpendicular.

 $[-10, 10, 1]$ by $[-10, 10, 1]$

 $[-15, 15, 1]$ by $[-10, 10, 1]$

 $[-10, 10, 1]$ by $[-3, 3, 1]$

 $[-3, 3, 1]$ by $[-2, 2, 1]$

(c) The lines appear perpendicular when the distance shown along the x -axis is approximately 1.5 times the distance along the y -axis.

97. $y_1 = x, y_2 = -x, y_3 = x + 2, y_4 = -x + 4$

99. $y_1 = x + 4, y_2 = x - 4, y_3 = -x + 4, y_4 = -x - 4$

101. 2.5 103. $\frac{9}{8}$ 105. $k = 2.5, y = 20$ when $x = 8$

107. $k = 0.06, x = \$85$ when $y = \$5.10$

109. \$1048, $k = 65.5$ 111. (a) $k = 0.01$ (b) 1.1 mm

113. (a) $k = \frac{15}{8}$ (b) $13\frac{1}{3}$ inches

115. (a) For (150, 26), $\frac{F}{x} \approx 0.173$; for (180, 31), $\frac{F}{x} \approx 0.172$; for (210, 36), $\frac{F}{x} \approx 0.171$; for (320, 54), $\frac{F}{x} \approx 0.169$; the ratios give the force needed to push a 1-pound box. (b) $k \approx 0.17$ (answers may vary)

(c) [125, 350, 25] by [0, 75, 5]

(d) 46.75 pounds

2.2 EXTENDED AND DISCOVERY EXERCISES (p. 112–113)

1. About 615 fish

CHECKING BASIC CONCEPTS FOR SECTIONS 2.1 AND 2.2 (p. 113)

1. Slope: -2 ; y -int: 4 ; x -int: 2

51. (a) $-3 < x < 2$, or $(-3, 2)$

(b) $x \leq -3$ or $x \geq 2$, or $(-\infty, -3] \cup [2, \infty)$

53. (a) 1, 2 (b) $1 < x < 2$, or $(1, 2)$

(c) $x < 1$ or $x > 2$, or $(-\infty, 1) \cup (2, \infty)$

55. $\{x \mid 1 \leq x \leq 2\}$, or $[1, 2]$

57. $\{x \mid -1 < x < -\frac{1}{2}\}$, or $(-1, -\frac{1}{2})$

59. $\{x \mid x \leq -3$ or $x \geq 5\}$, or $(-\infty, -3] \cup [5, \infty)$

61. $y = -f(x)$ $y = f(-x)$

69.

x	0	1	2	3
$g(x)$	11	-7	-10	19

71. 11 ft by 22 ft

73. (a) $h(0) = 5$; the stone was 5 ft above the ground when it was released. (b) 117 ft (c) 126 ft

(d) After 2 seconds and 3.5 seconds

75. 11 in. by 15 in.

77. (a) $f(x) \approx 0.00051x^2 - 0.00604x + 1.6$

(b) About 70.4; when 70.4% of the area is irrigated, the yield will be 3.7 tons per hectare.

CHAPTER 3 EXTENDED AND DISCOVERY EXERCISES (pp. 246-247)

1. (a) 23.32 ft/sec

(b) $[-1, 16, 1]$ by $[-1, 16, 1]$ Yes (c) 12.88 ft

3. (a) $[-1, 8, 1]$ by $[-4, 4, 1]$

(b) The graph of $y = f(2k - x) = f(4 - x)$ is a reflection of $y = f(x)$ across the line $x = 2$.

5. (a) $[-15, 3, 1]$ by $[-3, 9, 1]$

(b) The graph of $f(2k - x) = f(-12 - x)$ is a reflection of $y = f(x)$ across the line $x = -6$.

7. (a) $[0, 1200, 100]$ by $[-800, 0, 100]$

The front reached St. Louis, but not Nashville.

- (b) $g(x) = -\sqrt{750^2 - (x - 160)^2} - 110$

- (c) $[0, 1200, 100]$ by $[-800, 0, 100]$

The cold front reached both cities in less than 12 hours.

CHAPTER 4: More Nonlinear Functions and Equations

SECTION 4.1 (pp. 256–260)

1. Yes; degree: 3; a : 2 3. No
 5. Yes; degree: 4; a : -5
 7. No 9. Yes; degree: 0; a : 22
 11. (a) Local maximum: approximately 5.5; local minimum: approximately -5.5 (b) No absolute extrema
 13. (a) Local maxima: approximately 17 and 27; local minima: approximately -10 and 24 (b) No absolute extrema
 15. (a) Local maxima: approximately 0.5 and 2.8; local minimum: approximately 0 (b) Absolute maximum: 2.8; no absolute minimum
 17. (a) Local maximum: 0; local minimum: approximately -1000 (b) No absolute maximum; absolute minimum: -1000

19. (a) Local maximum: 1; local minimum: -1
 (b) Absolute maximum: 1; absolute minimum: -1
 21. (a) No local maxima; local minimum: approximately -3.2 (b) Absolute maximum: 3; absolute minimum: approximately -3.2
 23. (a) Local maxima: approximately 0.5 and 2; local minima: approximately -2 and -0.5 (b) Absolute maximum: 2; absolute minimum: -2
 25. (a) No local maxima; local minimum: -2
 (b) No absolute maximum; absolute minimum: -2
 27. (a) No local extrema (b) No absolute extrema
 29. (a) Local minimum: 1; no local maxima
 (b) Absolute minimum: 1; no absolute maximum
 31. (a) Local maximum: 4; no local minima
 (b) Absolute maximum: 4; no absolute minimum
 33. (a) Local minimum: $-\frac{1}{8}$; no local maxima
 (b) Absolute minimum: $-\frac{1}{8}$; no absolute maximum
 35. (a) Local minimum: 0; no local maxima
 (b) Absolute minimum: 0; no absolute maximum
 37. (a) No local extrema (b) No absolute extrema
 39. (a) Local minimum: -2; local maximum: 2
 (b) No absolute extrema
 41. (a) Local maxima: 19, -8; local minimum: -13
 (b) Absolute maximum: 19; no absolute minimum
 43. (a) Local minimum: -8; local maximum: 4.5
 (b) Absolute minimum: -8; no absolute maximum
 45. (a) Local maximum: 8; no local minima
 (b) Absolute maximum: 8; no absolute minimum
 47. Neither 49. Even
 51. Odd 53. Neither 55. Even 57. Even
 59. Odd 61. Neither 63. Even
 65. Even 67. Even 69. Neither 71. Odd
 73. Note that $f(0)$ can be any number.

x	-3	-2	-1	0	1	2	3
$f(x)$	21	-12	-25	1	-25	-12	21

75. $f(5) = 6$; $f(3) = -4$
 77. Answers may vary.

79. No. If $(2, 5)$ is on the graph of an odd function f , then so is $(-2, -5)$. Since f would pass through $(-3, -4)$ and then $(-2, -5)$, it could not always be increasing.

81. Answers may vary.

83. Answers may vary; yes, but it does not have to be quadratic.

85.

87.

89. On $[0, 3]$; on $[3, 6]$

91. (a) Absolute maximum: 84°F ; absolute minimum: 63°F ; the high temperature was 84°F and the low was 63°F . (b) Local maxima: approximately 78°F and 84°F ; local minima: approximately 63°F and 72°F . (c) $1.6 \leq x \leq 2.9$; $3.8 \leq x \leq 5$ (approximate)

93. (a) Possible absolute maximum in January and absolute minimum in July (b) Absolute maximum: \$140; absolute minimum: \$15; the maximum cost, \$140, occurs in January and the minimum cost, \$15, occurs in July.

$[1, 12, 1]$ by $[0, 150, 10]$

$[1, 12, 1]$ by $[0, 150, 10]$

95. (a) $f(5) \approx 8.32$; in 1955, U.S. consumption of energy was about 8.32 quadrillion Btu.

(b) The energy consumption increased, reached a maximum value, and then decreased.

$[0, 30, 5]$ by $[6, 16, 1]$

$[0, 30, 5]$ by $[6, 16, 1]$

(c) Local maximum: approximately 14.5; in 1973 or 1974, energy use peaked at 14.5 quadrillion Btu.

97. (a) Even (b) 83°F (c) They are equal.

(d) Monthly average temperatures are symmetric about July. July has the highest average and January the lowest.

The pairs June-August, May-September, April-October, March-November, and February-December have approximately the same average temperatures.

4.1 EXTENDED AND DISCOVERY EXERCISES (p. 260)

1. The maximum area occurs when the figure is a rectangle with length about 4.24 and height about 2.12.

3. (a) About 1 hour 54 minutes (b) About 2 hours 8 minutes (c) About 1 hour 46 minutes

SECTION 4.2 (pp. 270–276)

1. (a) The turning points are approximately (1.6, 3.6), (3, 1.2), (4.4, 3.6). (b) After 1.6 minutes, the runner is 360 feet from the starting line. The runner turns and jogs toward the starting line. After 3 minutes, the runner is 120 feet from the starting line. The runner turns and jogs away from the starting line. After 4.4 minutes, the runner is again 360 feet from the starting line. The runner turns and jogs back to the starting line.

3. (a) 0; 0.5 (b) $a > 0$ (c) 1

5. (a) 3; -6, -1, and 6 (b) $a < 0$ (c) 4

7. (a) 4; -3, -1, 0, 1, and 2 (b) $a > 0$ (c) 5

9. (a) 2; -3 (b) $a > 0$ (c) 3

11. (a) 1; -1 and 2 (b) $a > 0$ (c) 2

13. (a) d (b) (1, 0) (c) 1 (d) No local maxima; local minimum: 0 (e) No absolute maxima; absolute minimum: 0

15. (a) b (b) $(-3, 27), (1, -5)$ (c) $x \approx -4.9$, $x = 0$, $x \approx 1.9$ (d) Local maximum: 27; local minimum: -5 (e) No absolute maximum; no absolute minimum

17. (a) a (b) $(-2, 16), (0, 0), (2, 16)$ (c) $x \approx -2.8$, $x = 0$, $x \approx 2.8$ (d) Local maximum: 16; local minimum: 0 (e) Absolute maximum: 16; no absolute minimum

19. (a) $[-10, 10, 1]$ by $[-10, 10, 1]$

(b) $(-3, 6), (3, -6)$ (c) Local minimum: -6; local maximum: 6

21. (a) $[-10, 10, 1]$ by $[-10, 10, 1]$

(b) There are three turning points located at $(-3, -7.025)$, $(0, -5)$, and $(3, -7.025)$.

(c) Local minimum: -7.025; local maximum: -5

23. (a) $[-10, 10, 1]$ by $[-10, 10, 1]$

 (b) $(\frac{1}{3}, \frac{2}{3}) \approx (0.333, 0.667)$

 (c) Local minimum: $\frac{2}{3} \approx 0.667$; no local maximum

 25. (a) $[-10, 10, 1]$ by $[-10, 10, 1]$

 (b) $(-2, \frac{10}{3}) \approx (-2, 3.333)$, $(1, -\frac{7}{6}) \approx (1, -1.167)$

 (c) Local minimum: $-\frac{7}{6} \approx -1.167$; local maximum: $\frac{10}{3} \approx 3.333$

27. (a) Degree: 1; leading coefficient: -2

(b) Up on left end, down on right end;

 $f(x) \rightarrow \infty$ as $x \rightarrow -\infty$, $f(x) \rightarrow -\infty$ as $x \rightarrow \infty$

29. (a) Degree: 2; leading coefficient: 1

(b) Up on both ends;

 $f(x) \rightarrow \infty$ as $x \rightarrow -\infty$, $f(x) \rightarrow \infty$ as $x \rightarrow \infty$

31. (a) Degree: 3; leading coefficient: -2

(b) Up on left end, down on right end;

 $f(x) \rightarrow \infty$ as $x \rightarrow -\infty$, $f(x) \rightarrow -\infty$ as $x \rightarrow \infty$

33. (a) Degree: 3; leading coefficient: -1

(b) Up on left end, down on right end;

 $f(x) \rightarrow \infty$ as $x \rightarrow -\infty$, $f(x) \rightarrow -\infty$ as $x \rightarrow \infty$

35. (a) Degree: 5; leading coefficient: 0.1

(b) Down on left end, up on right end;

 $f(x) \rightarrow -\infty$ as $x \rightarrow -\infty$, $f(x) \rightarrow \infty$ as $x \rightarrow \infty$

 37. (a) Degree: 2; leading coefficient: $-\frac{1}{2}$

(b) Down on both ends;

 $f(x) \rightarrow -\infty$ as $x \rightarrow -\infty$, $f(x) \rightarrow -\infty$ as $x \rightarrow \infty$

(b) Degree 3

 (c) $a < 0$

 (d) $f(x) = -x^3 + 8x$

(b) Degree 2

 (c) $a > 0$

 (d) $f(x) = x^2 - 2x - 1$

43. (a)

 (b) Degree 4 (c) $a < 0$ (d) $f(x) = -x^4 + 3x^2 - 1$

45. Answers may vary

47. Answers may vary.

49. Not possible

53. Answers may vary.

51. Not possible

55.

 57. As the viewing rectangle increases in size, the graphs begin to look alike. Each formula contains the term $2x^4$, which determines the end behavior of the graph for large values of $|x|$.

 (a) $[-4, 4, 1]$ by $[-4, 4, 1]$ (b) $[-10, 10, 1]$ by $[-100, 100, 10]$

 (c) $[-100, 100, 10]$ by $[-10^6, 10^6, 10^5]$

 59. For f : 1; for g : 0.5; for h : 0.25. On the interval $[0, 0.5]$, the higher the degree of the function, the smaller the average rate of change.

61. (a) 12.01 (b) 12.0001 (c) 12.000001

The average rate of change is approaching 12.

63. (a) $4.01\bar{6}$ (b) $4.0001\bar{6}$ (c) $4.000001\bar{6}$

The average rate of change is approaching 4.

65. $9x^2 + 9xh + 3h^2$

67. $-3x^2 - 3xh - h^2 + 1$

69. $f(-2) \approx 5, f(1) \approx 0$

71. $f(-1) \approx -1, f(1) \approx 1, f(2) \approx -2$

73. $f(-3) = -63, f(1) = 3, f(4) = 10$

75. $f(-2) = 6, f(1) = 7, f(2) = 9$

(b) f is not continuous.

(c) ± 2

(b) f is continuous.

(c) $-\sqrt[3]{3}, \frac{\sqrt{17}+1}{2}$

85. (a) Approximately (1, 13) and (7, 72)

(b) The low monthly average temperature of 13°F occurs in January. The high monthly average temperature of 72°F occurs in July.

87. (a) $f(x) \approx -0.15311111x^3 + 914.695238x^2 - 1,821,416.18x + 1,208,942,069.3$ (answers may vary)

(b) $f(1998) \approx 1704$; interpolation (c) About 1996

89. (a) $f(x) \approx \frac{2}{3000}x^3 - 3.9x^2 + 7604.7333x - 4,942,725$

(b) [1950, 2010, 10] by [0, 80, 20]

(c) $f(1994) \approx 50; f(2010) \approx 133$; the 1994 value is correct and the 2010 value is 4 thousand too high.

(d) 1994, interpolation; 2010, extrapolation

(b) f is continuous.

(c) $\sqrt{2}$

83. (a) $H(-2) = 0;$
 $H(0) = 1; H(3.5) = 1$

(b)

91. (a)

(b)
$$f(x) = \begin{cases} 8x & \text{if } 0 \leq x \leq 2 \\ 1.32x^2 - 14.4x + 39.39 & \text{if } 2 < x \leq 5 \end{cases}$$

(c) $f(1.25) = 10$ cm, $f(3.2) \approx 7$ cm (answers may vary)

(d) About 3.55 minutes (answers may vary)

4.2 EXTENDED AND DISCOVERY EXERCISES (p. 276)

1. (a) $D = [0, 10]$, or $\{x \mid 0 \leq x \leq 10\}$

(b) $A(1) = 405$; after 1 min, the tank contains 405 gal of water. (c) Degree: 2; leading coefficient: 5 (d) No, more than half; yes, because the water will drain faster at first.

3. Conc. down: $(-\infty, \infty)$

5. Conc. up: $(1, \infty)$; conc. down: $(-\infty, 1)$

7. Conc. up: $(-2, 2)$; conc. down: $(-\infty, -2) \cup (2, \infty)$

CHECKING BASIC CONCEPTS FOR SECTIONS 4.1 AND 4.2 (pp. 276–277)

1. (a) Incr: $[-2, 1] \cup [3, \infty)$, or $\{x \mid -2 \leq x \leq 1 \text{ or } x \geq 3\}$; decr: $(-\infty, -2] \cup [1, 3]$, or $\{x \mid x \leq -2 \text{ or } 1 \leq x \leq 3\}$

(b) Local maximum: approximately 3; local minima: approximately -13 and -2

(c) No absolute maximum; absolute minimum: approximately -13 (d) Approximately $-3.1, 0, 2.2$, and 3.6 ; they are the same values.

3. (a) Not possible

(b) Answers may vary.

(c) Answers may vary.

(d) Not possible

5. $f(x) \approx -1.01725x^4 + 10.319x^2 - 10$

SECTION 4.3 (pp. 283–285)

1. $\frac{x^3}{2} - \frac{3}{2x}$
3. $x - \frac{2}{3x} - \frac{1}{3x^3}$
5. $-\frac{1}{x^3} + \frac{1}{4}$

45. $2x^4 - 2x^3 + 4 + \frac{1}{x+0.5}$
47. 3
49. -42
51. $L = 4x + 3$; 43 ft

SECTION 4.4 (pp. 296–301)

1. $(x+2)$, $(x+1)$, $(x-1)$
3. $(x+2)$, $(x+1)$, $(x-1)$, $(x-2)$
5. $f(x) = 2(x - \frac{11}{2})(x-7)$
7. $f(x) = (x+2)(x-1)(x-3)$
9. $f(x) = -2(x+5)(x - \frac{1}{2})(x-6)$
11. $f(x) = 7(x+3)(x-2)$
13. $f(x) = -2x(x+1)(x-1)$
15. $f(x) = (x+4)(x-2)(x-8)$
17. $f(x) = -1(x+8)(x+4)(x+2)(x-4)$
19. $f(x) = \frac{1}{2}(x+1)(x-2)(x-3)$
21. $f(x) = \frac{1}{2}(x+1)(x-1)(x-2)$
23. $f(x) = -2(x+2)(x+1)(x-1)(x-2)$
25. $f(x) = 10(x+2)(x - \frac{3}{10})$
27. $f(x) = -3x(x-2)(x+3)$
29. $f(x) = x(x+1)(x+3)(x - \frac{3}{2})$
31. $f(x) = (x-1)(x-3)(x-5)$
33. $f(x) = -4(x+4)(x - \frac{3}{4})(x-3)$
35. $f(x) = 2x(x+2)(x + \frac{1}{2})(x-3)$
37. Yes
39. No
41. -2 (odd), 4 (even); minimum degree: 5
43. $f(x) = (x+1)^2(x-6)$
45. $f(x) = (x-2)^3(x-6)$
47. $f(x) = (x+2)^2(x-4)$
49. $f(x) = -1(x+3)^2(x-3)^2$
51. $f(x) = 2(x+1)^2(x-1)^3$

 53. (a) x -int: -2, -1; y -int: 4

(b) -2 has multiplicity 1; -1 has multiplicity 2

(c)

 55. (a) x -int: -2, 0, 2; y -int: 0

(b) 0 has multiplicity 2; -2 and 2 each have multiplicity 1

(c)

 57. (a) $-3, \frac{1}{2}, 1$ (b) $f(x) = 2(x+3)(x - \frac{1}{2})(x-1)$

 59. (a) -2, -1, $1, \frac{3}{2}$

 (b) $f(x) = 2(x+2)(x+1)(x-1)(x - \frac{2}{3})$

 61. (a) $\frac{1}{3}, 1, 4$ (b) $f(x) = 3(x - \frac{1}{3})(x-1)(x-4)$

 63. (a) 1 (b) $f(x) = (x + \sqrt{7})(x-1)(x - \sqrt{7})$

65. Possible: 0 or 2 positive, 1 negative; actual: 0 positive, 1 negative

67. Possible: 1 positive, 1 negative; actual: 1 positive, 1 negative

69. Possible: 0 or 2 positive, 1 or 3 negative; actual: 0 positive, 1 negative

71. -3, 0, 2 73. -1, 1 75. -2, 0, 2

 77. -5, 0, 5 79. ± 2 81. -3, 0, 6

 83. 0, 1 85. $-\frac{1}{4}, 0, \frac{5}{3}$

 87. $\pm \frac{2}{3}, \pm 1$ 89. -1, $\pm \frac{\sqrt{3}}{2}$ 91. $\pm 2, \frac{1}{2}$

 93. $\pm \frac{3}{2}, \pm \frac{\sqrt{6}}{2}$ 95. -2, 3 97. -2.01, 0.12, 2.99

99. -4.05, -0.52, 1.71

101. -2.69, -1.10, 0.55, 3.98

 103. Because $f(2) = -1 < 0$ and $f(3) = 4 > 0$, the intermediate value property states that there exists an x -value between 2 and 3 where $f(x) = 0$.

 105. Because $f(0) = -1 < 0$ and $f(1) = 1 > 0$, the intermediate value property states that there exists an x -value between 0 and 1 where $f(x) = 0$.

107. 4, 32; yes, by the intermediate value property

109. 12 A.M., 2 A.M., 4 A.M.

111. Approximately 11.34 cm

113. June 2, June 22, and July 12

115. (a) $f(x) \approx -0.184(x + 6.01)(x - 2.15)(x - 11.7)$

(b) The zero of -6.01 has no significance. The zeros of $2.15 \approx 2$ and $11.7 \approx 12$ indicate that during February and December the average temperature is 0°F .

117. (a) As x increases, C decreases.

(b) $C(x) \approx -0.000068x^3 + 0.0099x^2 - 0.653x + 23$

(c) $[0, 70, 10]$ by $[0, 22, 5]$

(d) $0 \leq x < 32.1$ (approximately)

4.4 EXTENDED AND DISCOVERY EXERCISES (p. 301)

1. Dividing $P(x)$ by $x - 2$ synthetically results in the following bottom row: 1 1 5 2 12.

Since $2 > 0$ and the bottom row values are all nonnegative, there is no real zero greater than 2.

3. Dividing $P(x)$ by $x + 2$ synthetically results in the following bottom row: 1 -1 1 -2 7.

Since $-2 < 0$ and the bottom row values alternate in sign, there is no real zero less than -2 .

5. Dividing $P(x)$ by $x - 1$ synthetically results in the following bottom row: 3 5 1 2 1.

Since $1 > 0$ and the bottom row values are all nonnegative, there is no real zero greater than 1.

CHECKING BASIC CONCEPTS FOR SECTIONS 4.3 AND 4.4 (p. 301)

1. $x^2 - 2x + 1$

3. $f(x) = -\frac{1}{2}(x + 2)^2(x - 1)$;

-2 has multiplicity 2; 1 has multiplicity 1

5. The zeros are $-4, -1, 2$, and 4 ;

$f(x) = (x + 4)(x + 1)(x - 2)(x - 4)$

SECTION 4.5 (pp. 307–308)

1. Two imaginary zeros

3. One real zero; two imaginary zeros

5. Two real zeros; two imaginary zeros

7. Three real zeros; two imaginary zeros

9. (a) $f(x) = (x - 6i)(x + 6i)$ (b) $f(x) = x^2 + 36$

11. (a) $f(x) = -1(x + 1)(x - 2i)(x + 2i)$

(b) $f(x) = -x^3 - x^2 - 4x - 4$

13. (a) $f(x) = 10(x - 1)(x + 1)(x - 3i)(x + 3i)$

Answers may vary for Exercises 81–93.

$$81. f(x) = x - 2, g(x) = \sqrt{x}$$

$$83. f(x) = x + 2, g(x) = \frac{1}{x}$$

$$85. f(x) = 2x + 1, g(x) = 4x^3$$

$$87. f(x) = x^3 - 1, g(x) = x^2$$

$$89. f(x) = x + 2, g(x) = -4|x| - 3$$

$$91. f(x) = x - 1, g(x) = \frac{1}{x^2}$$

$$93. f(x) = x^{1/4}, g(x) = x^3 - x$$

$$95. P(x) = 13x - 2000; P(3000) = \$37,000$$

$$97. (a) I(x) = 36x \quad (b) C(x) = 2.54x$$

$$(c) F(x) = (C \circ I)(x) \quad (d) F(x) = 91.44x$$

$$99. (a) r(x) = \frac{11}{6}x \quad (b) s(x) = \frac{11}{6}x + \frac{1}{9}x^2$$

$$(c) s(60) = 510; \text{ it takes 510 feet to stop when traveling 60 mi/hr.}$$

$$101. (a) (g \circ f)(1) = 5.25; \text{ a 1\% decrease in the ozone layer could result in a 5.25\% increase in skin cancer.}$$

$$(b) \text{Not possible using the given tables}$$

$$103. (a) 4.5\% \quad (b) (g \circ f)(x) \text{ computes the percent increase in peak electrical demand during year } x.$$

$$105. (a) (g \circ f)(1960) = 1.98$$

$$(b) (g \circ f)(x) = 0.165(x - 1948)$$

$$(c) f, g, \text{ and } g \circ f \text{ are all linear functions.}$$

107. (a) $(g \circ f)(2) \approx 25^\circ\text{C}$ (b) $(g \circ f)(x)$ computes the Celsius temperature after x hours.

109. $A = 36\pi t^2$

111. (a) $A(4s) = 16\sqrt{3}s^2 = 16A(s)$; if the length of a side is quadrupled, the area increases by a factor of 16.

(b) $A(s+2) = \frac{\sqrt{3}}{4}(s^2 + 4s + 4) = A(s) + \sqrt{3}(s+1)$; if the length of a side increases by 2, the area increases by $\sqrt{3}(s+1)$.

113. (a) 50 (b) $(C+O)(x)$ computes the total SO_2 emissions from coal and oil during year x .

x	1860	1900	1940	1970	2000
$(C+O)(x)$	2.4	12.8	26.5	50.0	78.0

x	1990	2000	2010	2020	2030
$h(x)$	32	35.5	39	42.5	46

115. (a) $h(x) = f(x) + g(x)$

117. $h(x) = 0.35x - 664.5$

119. (a) $P(h_0) = mgh_0 = \frac{1}{2}m \cdot 2gh_0 = \frac{1}{2}m(\sqrt{2gh_0})^2 = \frac{1}{2}m(v_f)^2 = K(v_f)$

(b) The potential energy of the ball before it is dropped is equal to the kinetic energy of the ball when it lands.

121. Let $f(x) = ax + b$ and $g(x) = cx + d$. Then

$f(x) + g(x) = (ax + b) + (cx + d) = (a+c)x + (b+d)$, which is linear.

123. (a) $(f \circ g)(x) = k$; a constant function

(b) $(g \circ f)(x) = ak + b$; a constant function

SECTION 5.2 (pp. 396–401)

1. Closing a window

3. Closing a book, standing up, and walking out of the classroom 5. Subtract 2 from x ; $x+2$ and $x-2$

7. Divide x by 3 and then add 2; $3(x-2)$ and $\frac{x}{3}+2$

9. Subtract 1 from x and cube the result; $\sqrt[3]{x}+1$ and $(x-1)^3$ 11. Take the reciprocal of x ; $\frac{1}{x}$ and $\frac{x}{1}$

13. One-to-one 15. Not one-to-one

17. Not one-to-one

19. Not one-to-one; does not have an inverse

$[0, 5, 1]$ by $[0, 3, 1]$

CHAPTER 5 EXTENDED AND DISCOVERY EXERCISES (pp. 476–477)

1. The data points $(\ln x, \ln y)$ seem to be almost linear. Using linear regression gives the equation $y = 1.5x - 8.5$. Since $b = 1.5$ and $a = e^{-8.5} \approx 0.0002$, we get the power function $f(x) = 0.0002x^{1.5}$.
3. (a) $(T \circ R)(x) = 0.206e^{0.0124x}$
(b) $(T \circ R)(100) \approx 0.7119$; in the year 1900, radiative forcing due to increased greenhouse gases was responsible for a 0.7°F increase in average global temperature.
5. (a) $e^{\pi\sqrt{163}} \approx 262,537,412,640,768,743.999999999999925$; it is not an integer.

CHAPTER 6: Trigonometric Functions

SECTION 6.1 (pp. 488–492)

1. (a)

(b)

(c)

(d)

3. Answers may vary.

5.

7. Answers may vary.

9. Answers may vary.

11. (a) $\frac{1}{4}$ (b) $\frac{1}{12}$ (c) $\frac{1}{6}$ (d) $\frac{1}{8}$

13. $510^\circ, -210^\circ$ (answers may vary)

15. $288^\circ, -432^\circ$ (answers may vary)

17. $\frac{5\pi}{2}, -\frac{3\pi}{2}$ (answers may vary)

19. $\frac{9\pi}{5}, -\frac{11\pi}{5}$ (answers may vary)

21. 125.25° 23. 108.76° 25. $125^\circ 18'$

27. $51^\circ 21' 36''$ 29. $\alpha = 34.1^\circ, \beta = 124.1^\circ$

31. $\alpha = 4^\circ 36' 15'', \beta = 94^\circ 36' 15''$

33. $\alpha = 66^\circ 19' 25'', \beta = 156^\circ 19' 25''$

35. $\theta = 2$ radians; $\theta \approx 114.6^\circ$

37. $\theta = 1.3$ radians; $\theta \approx 74.5^\circ$

39. (a) $\frac{\pi}{4}$ (b) $\frac{3\pi}{4}$ (c) $-\frac{2\pi}{3}$ (d) $-\frac{7\pi}{6}$

41. (a) $\frac{37\pi}{180}$ (b) 2.15 (c) -1.61 (d) 4.02

43. (a) 30° (b) 12° (c) -300° (d) -210°

45. (a) 45° (b) 25.71° (c) 177.62° (d) -143.24°

47. $s = \frac{2\pi}{3}$ in. 49. $\theta = \frac{12}{5}$ radians 51. $r = \frac{5}{\pi}$ ft

53. $\frac{\pi}{4}$ m 55. π ft 57. $\frac{7\pi}{360}$ mi 59. 2π in.; $\frac{2\pi}{15}$ in./min

61. 10π in.; $\frac{2\pi}{15}$ in./min 63. 1.5π in² 65. 4.5π in²

67. $\frac{17,161\pi}{3000} \approx 5.72\pi$ cm² 69. $\frac{3\pi}{16} \approx 0.59$ ft²

71. 240π in² 73. 4292π cm²

75. 16.25 ft/sec; about 11.1 mi/hr 77. $49.8''/\text{yr}$

79. (a) $1000\pi \approx 3141.6$ radians/min

(b) $15,000\pi \approx 47,123.89$ in./min, or about 65.4 ft/sec

81. 810 mi 83. About 69 ft/sec 85. 14.5 in.

87. (a) 2.5 revolutions (b) $\frac{65\pi}{6} \approx 34$ ft/sec

89. (a) 78,370 mi/hr (b) 66,630 mi/hr

(c) 29,250 mi/hr (d) 12,160 mi/hr

Planets farther from the sun have slower orbital velocities.

91. 137.2 m 93. (a) 388.8 m (b) 881.8 m

6.1 EXTENDED AND DISCOVERY EXERCISES (p. 492)

1. $s = r\theta\left(\frac{\pi}{180^\circ}\right)$, where θ is in degrees. The formula for radian measure is simpler.

SECTION 6.2 (pp. 500–505)

1.

3.

5. $\frac{\sqrt{3}}{2}$ 7. $\frac{\sqrt{3}}{2}$ 9. 2 11. 1 13. 1 15. $\frac{1}{\sqrt{2}}$

17. $\sin \theta = \frac{4}{5}, \cos \theta = \frac{3}{5}, \tan \theta = \frac{4}{3},$

$\csc \theta = \frac{5}{4}, \sec \theta = \frac{5}{3}, \cot \theta = \frac{3}{4}$

19. $\sin \theta = \frac{12}{13}, \cos \theta = \frac{5}{13}, \tan \theta = \frac{12}{5},$

$\csc \theta = \frac{13}{12}, \sec \theta = \frac{13}{5}, \cot \theta = \frac{5}{12}$

21. $\sin 60^\circ \approx 0.866, \cos 60^\circ = 0.5, \tan 60^\circ \approx 1.732,$

$\csc 60^\circ \approx 1.155, \sec 60^\circ = 2, \cot 60^\circ \approx 0.577$

23. $\sin 25^\circ \approx 0.423, \cos 25^\circ \approx 0.906, \tan 25^\circ \approx 0.466,$

$\csc 25^\circ \approx 2.366, \sec 25^\circ \approx 1.103, \cot 25^\circ \approx 2.145$

25. $\sin 5^\circ 35' \approx 0.097, \cos 5^\circ 35' \approx 0.995,$

$\tan 5^\circ 35' \approx 0.098, \csc 5^\circ 35' \approx 10.278,$

$\sec 5^\circ 35' \approx 1.005, \cot 5^\circ 35' \approx 10.229$

27. $\sin 13^\circ 45' 30'' \approx 0.238, \cos 13^\circ 45' 30'' \approx 0.971,$

$\tan 13^\circ 45' 30'' \approx 0.245, \csc 13^\circ 45' 30'' \approx 4.205,$

$\sec 13^\circ 45' 30'' \approx 1.030, \cot 13^\circ 45' 30'' \approx 4.084$

29. $\sin 1.05^\circ \approx 0.018, \cos 1.05^\circ \approx 1.000,$

$\tan 1.05^\circ \approx 0.018, \csc 1.05^\circ \approx 54.570,$

$\sec 1.05^\circ \approx 1.000, \cot 1.05^\circ \approx 54.561$

31. 3 33. $\frac{13}{12}$ 35. $\frac{24}{7}$ 37. $a \approx 13.86, b = 8$

39. $b \approx 5.03, c \approx 7.83$ 41. $a \approx 5.25, b \approx 6.04$

43. $a \approx 16.82, c \approx 23.28$

45. $a = 12, b = 12\sqrt{3}, c = 12\sqrt{6}, d = 12\sqrt{3}$

47. $a = \frac{14\sqrt{3}}{3}, b = \frac{7\sqrt{3}}{3}, c = \frac{14\sqrt{3}}{3}, d = \frac{14\sqrt{6}}{3}$

49. $a \approx 20.78$ 51. $c \approx 168.98$

53. (a) $\cos 20^\circ \approx 0.9397$ (b) $\sin 50^\circ \approx 0.7660$

55. (a) $\sec 41^\circ \approx 1.3250$ (b) $\csc 27^\circ \approx 2.2027$

57. $1500 \tan 37^\circ 30' \approx 1151$ ft 59. 7.8 ft

61. About 34 ft 63. 52,000 ft 65. About 128.2 ft

67. About 194.5 ft 69. 19,600 ft 71. 114 ft

73. Barnard's Star: 3.5×10^{13} mi, 5.9 light-years;

Sirius: 5.1×10^{13} mi, 8.6 light-years;

61 Cygni: 6.6×10^{13} mi, 11.1 light-years;

Procyon: 6.7×10^{13} mi, 11.3 light-years

75. Min: 2.9×10^7 mi; max: 4.4×10^7 mi

77. 12,534 mi

79. (a) About 704 ft (b) About 595 ft
(c) Increasing θ decreases r .

81. $d = 625\left(\frac{1}{\cos 54^\circ} - 1\right) \approx 438$ ft 83. $A = \frac{\sqrt{3}}{4} s^2$

CHECKING BASIC CONCEPTS FOR SECTIONS 6.1 AND 6.2 (p. 505)

1. (a) $\frac{\pi}{4}$ (b) $\frac{5\pi}{12}$ 3. $s = 2\pi$ in.; $A = 12\pi$ in²
5. $\sin \theta = \frac{5}{13}$, $\cos \theta = \frac{12}{13}$, $\tan \theta = \frac{5}{12}$, $\csc \theta = \frac{13}{5}$,
 $\sec \theta = \frac{13}{12}$, $\cot \theta = \frac{12}{5}$

SECTION 6.3 (pp. 518–522)

1. (a) 13 (b) $\sin \theta = \frac{5}{13}$, $\cos \theta = \frac{12}{13}$
3. (a) 17 (b) $\sin \theta = \frac{8}{17}$, $\cos \theta = -\frac{15}{17}$
5. $\sin \theta = \frac{3}{5}$, $\cos \theta = \frac{4}{5}$
7. $\sin \theta = -\frac{2}{\sqrt{5}}$, $\cos \theta = \frac{1}{\sqrt{5}}$
9. $\sin \theta = \frac{2}{\sqrt{5}}$, $\cos \theta = \frac{1}{\sqrt{5}}$
11. $\sin \theta = -\frac{3}{\sqrt{10}}$, $\cos \theta = \frac{1}{\sqrt{10}}$
13. $\sin 45^\circ = \frac{1}{\sqrt{2}}$, $\cos 45^\circ = \frac{1}{\sqrt{2}}$
15. $\sin(-30^\circ) = -\frac{1}{2}$, $\cos(-30^\circ) = \frac{\sqrt{3}}{2}$
17. $\sin 225^\circ = -\frac{1}{\sqrt{2}}$, $\cos 225^\circ = -\frac{1}{\sqrt{2}}$
19. $\sin(-420^\circ) = -\frac{\sqrt{3}}{2}$, $\cos(-420^\circ) = \frac{1}{2}$
21. $\sin \frac{\pi}{3} = \frac{\sqrt{3}}{2}$, $\cos \frac{\pi}{3} = \frac{1}{2}$
23. $\sin\left(-\frac{\pi}{2}\right) = -1$, $\cos\left(-\frac{\pi}{2}\right) = 0$
25. $\sin \frac{7\pi}{6} = -\frac{1}{2}$, $\cos \frac{7\pi}{6} = -\frac{\sqrt{3}}{2}$
27. $\sin\left(-\frac{9\pi}{4}\right) = -\frac{1}{\sqrt{2}}$, $\cos\left(-\frac{9\pi}{4}\right) = \frac{1}{\sqrt{2}}$
29. $\sin 93.2^\circ \approx 0.9984$, $\cos 93.2^\circ \approx -0.0558$
31. $\sin 123^\circ 50' \approx 0.8307$, $\cos 123^\circ 50' \approx -0.5568$
33. $\sin(-4) \approx 0.7568$, $\cos(-4) \approx -0.6536$
35. $\sin \frac{11\pi}{7} \approx -0.9749$, $\cos \frac{11\pi}{7} \approx 0.2225$
37. $\sin \theta = \frac{3}{5}$, $\cos \theta = \frac{4}{5}$ 39. $\sin \theta = -\frac{5}{13}$, $\cos \theta = \frac{12}{13}$
41. $\sin \frac{\pi}{2} = 1$, $\cos \frac{\pi}{2} = 0$
43. $\sin \frac{7\pi}{6} = -\frac{1}{2}$, $\cos \frac{7\pi}{6} = -\frac{\sqrt{3}}{2}$

45. $\sin\left(-\frac{3\pi}{4}\right) = -\frac{1}{\sqrt{2}}$, $\cos\left(-\frac{3\pi}{4}\right) = -\frac{1}{\sqrt{2}}$

47. $\sin \frac{5\pi}{2} = 1$, $\cos \frac{5\pi}{2} = 0$

49. $\sin\left(-\frac{\pi}{3}\right) = -\frac{\sqrt{3}}{2}$, $\cos\left(-\frac{\pi}{3}\right) = \frac{1}{2}$

51. $(-1, 0)$ 53. $(1, 0)$ 55. $(0, -1)$ 57. $(0, -1)$

59. $\left(-\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}\right)$ 61. $\left(-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right)$ 63. $\left(\frac{\sqrt{3}}{2}, -\frac{1}{2}\right)$

65. $\left(\frac{1}{2}, -\frac{\sqrt{3}}{2}\right)$ 67. $\sin 3\pi = 0$, $\cos 3\pi = -1$

69. $\sin(-2\pi) = 0$, $\cos(-2\pi) = 1$

71. $\sin \frac{3\pi}{2} = -1$, $\cos \frac{3\pi}{2} = 0$

73. $\sin\left(-\frac{5\pi}{2}\right) = -1$, $\cos\left(-\frac{5\pi}{2}\right) = 0$

75. $\sin \frac{5\pi}{4} = -\frac{1}{\sqrt{2}}$, $\cos \frac{5\pi}{4} = -\frac{1}{\sqrt{2}}$

77. $\sin\left(-\frac{5\pi}{4}\right) = \frac{1}{\sqrt{2}}$, $\cos\left(-\frac{5\pi}{4}\right) = -\frac{1}{\sqrt{2}}$

79. $\sin \frac{11\pi}{6} = -\frac{1}{2}$, $\cos \frac{11\pi}{6} = \frac{\sqrt{3}}{2}$

81. $\sin\left(-\frac{7\pi}{3}\right) = -\frac{\sqrt{3}}{2}$, $\cos\left(-\frac{7\pi}{3}\right) = \frac{1}{2}$

83. (a) $[-2\pi, 2\pi, \pi/2]$ by $[-4, 4, 1]$

$R = \{y \mid -3 \leq y \leq 3\}$; $f\left(\frac{3\pi}{2}\right) = -3$

(b) $[-2\pi, 2\pi, \pi/2]$ by $[-4, 4, 1]$

$R = \{y \mid -1 \leq y \leq 1\}$; $f\left(\frac{3\pi}{2}\right) = 1$

85. (a) $[-2\pi, 2\pi, \pi/2]$ by $[-4, 4, 1]$

$R = \{y \mid -1 \leq y \leq 3\}$; $f\left(\frac{3\pi}{2}\right) = 1$

(b) $[-2\pi, 2\pi, \pi/2]$ by $[-4, 4, 1]$

$R = \{y \mid -2 \leq y \leq 0\}$; $f\left(\frac{3\pi}{2}\right) = -2$

87. (a) 3% (b) $25,000 \left(\frac{3}{\sqrt{10,009}} \right) \approx 750$ lb

89. First quarter: $\frac{\pi}{2} + 2\pi n$

91. (a) V is sinusoidal and varies between -310 volts and 310 volts. (b) $V(1/120) = 0$; after $1/120$ second, the voltage is 0 . (c) $310/\sqrt{2} \approx 219$ volts

93. (a) 201 ft (b) 258 ft (c) It is easier to stop going uphill ($\theta > 0$) than downhill ($\theta < 0$).

95. (a) 31.4 ft (b) 78.3 ft (c) When the speed limit is higher, more land needs to be cleared on the inside of the curve.

97. (a) $[0, 13, 1]$ by $[3, 8, 1]$

(b) $[0, 13, 1]$ by $[3, 8, 1]$

From the close data fit shown, we may conclude that flying squirrels become active near sunset.

6.3 EXTENDED AND DISCOVERY EXERCISES (p. 522)

1. $[-2\pi, 2\pi, \pi/2]$ by $[-2, 2, 1]$

The translated graph and the graph of g are identical.

SECTION 6.4 (pp. 534–537)

1. $\sin \theta = \frac{12}{13}$, $\cos \theta = \frac{5}{13}$, $\tan \theta = \frac{12}{5}$, $\csc \theta = \frac{13}{12}$,

$\sec \theta = \frac{13}{5}$, $\cot \theta = \frac{5}{12}$ 3. $\sin \theta = -\frac{24}{25}$, $\cos \theta = \frac{7}{25}$,

$\tan \theta = -\frac{24}{7}$, $\csc \theta = -\frac{25}{24}$, $\sec \theta = \frac{25}{7}$, $\cot \theta = -\frac{7}{24}$

5. $\sin 90^\circ = 1$, $\cos 90^\circ = 0$, $\tan 90^\circ$ is undefined, $\csc 90^\circ = 1$, $\sec 90^\circ$ is undefined, $\cot 90^\circ = 0$

7. $\sin(-45^\circ) = -\frac{1}{\sqrt{2}}$, $\cos(-45^\circ) = \frac{1}{\sqrt{2}}$,

$\tan(-45^\circ) = -1$, $\csc(-45^\circ) = -\sqrt{2}$,

$\sec(-45^\circ) = \sqrt{2}$, $\cot(-45^\circ) = -1$

9. $\sin \pi = 0$, $\cos \pi = -1$, $\tan \pi = 0$, $\csc \pi$ is undefined, $\sec \pi = -1$, $\cot \pi$ is undefined

11. $\sin\left(-\frac{\pi}{3}\right) = -\frac{\sqrt{3}}{2}$, $\cos\left(-\frac{\pi}{3}\right) = \frac{1}{2}$,

$\tan\left(-\frac{\pi}{3}\right) = -\sqrt{3}$, $\csc\left(-\frac{\pi}{3}\right) = -\frac{2}{\sqrt{3}}$,

$\sec\left(-\frac{\pi}{3}\right) = 2$, $\cot\left(-\frac{\pi}{3}\right) = -\frac{1}{\sqrt{3}}$

13. $\sin\left(-\frac{\pi}{2}\right) = -1$, $\cos\left(-\frac{\pi}{2}\right) = 0$,

$\tan\left(-\frac{\pi}{2}\right)$ is undefined, $\csc\left(-\frac{\pi}{2}\right) = -1$,

$\sec\left(-\frac{\pi}{2}\right)$ is undefined, $\cot\left(-\frac{\pi}{2}\right) = 0$

15. $\sin 360^\circ = 0$, $\cos 360^\circ = 1$, $\tan 360^\circ = 0$, $\csc 360^\circ$ is undefined, $\sec 360^\circ = 1$, $\cot 360^\circ$ is undefined

17. $\sin \frac{\pi}{6} = \frac{1}{2}$, $\cos \frac{\pi}{6} = \frac{\sqrt{3}}{2}$, $\tan \frac{\pi}{6} = \frac{1}{\sqrt{3}}$,

$\csc \frac{\pi}{6} = 2$, $\sec \frac{\pi}{6} = \frac{2}{\sqrt{3}}$, $\cot \frac{\pi}{6} = \sqrt{3}$

19. $\sin \frac{4\pi}{3} = -\frac{\sqrt{3}}{2}$, $\cos \frac{4\pi}{3} = -\frac{1}{2}$, $\tan \frac{4\pi}{3} = \sqrt{3}$,

$\csc \frac{4\pi}{3} = -\frac{2}{\sqrt{3}}$, $\sec \frac{4\pi}{3} = -2$, $\cot \frac{4\pi}{3} = \frac{1}{\sqrt{3}}$

21. $\sin(-225^\circ) = \frac{1}{\sqrt{2}}$, $\cos(-225^\circ) = -\frac{1}{\sqrt{2}}$,

$\tan(-225^\circ) = -1$, $\csc(-225^\circ) = \sqrt{2}$,

$\sec(-225^\circ) = -\sqrt{2}$, $\cot(-225^\circ) = -1$

23. $\sin\left(-\frac{13\pi}{6}\right) = -\frac{1}{2}$, $\cos\left(-\frac{13\pi}{6}\right) = \frac{\sqrt{3}}{2}$,

$\tan\left(-\frac{13\pi}{6}\right) = -\frac{1}{\sqrt{3}}$, $\csc\left(-\frac{13\pi}{6}\right) = -2$,

$\sec\left(-\frac{13\pi}{6}\right) = \frac{2}{\sqrt{3}}$, $\cot\left(-\frac{13\pi}{6}\right) = -\sqrt{3}$

25. $\sin \theta = \frac{4}{\sqrt{17}}$, $\cos \theta = -\frac{1}{\sqrt{17}}$, $\tan \theta = -4$,

$\csc \theta = \frac{\sqrt{17}}{4}$, $\sec \theta = -\sqrt{17}$, $\cot \theta = -\frac{1}{4}$

The slope of the line equals $\tan \theta$.

27. $\sin \theta = -\frac{6}{\sqrt{37}}$, $\cos \theta = -\frac{1}{\sqrt{37}}$, $\tan \theta = 6$,

$\csc \theta = -\frac{\sqrt{37}}{6}$, $\sec \theta = -\sqrt{37}$, $\cot \theta = \frac{1}{6}$

The slope of the line equals $\tan \theta$.

29. $\tan \theta = \frac{3}{4}$, $\cot \theta = \frac{4}{3}$, $\csc \theta = \frac{5}{3}$, $\sec \theta = \frac{5}{4}$

31. $\sin \theta = -\frac{15}{17}$, $\cos \theta = -\frac{8}{17}$, $\tan \theta = \frac{15}{8}$, $\cot \theta = \frac{8}{15}$

33. $\sin \theta = \frac{5}{13}$, $\csc \theta = \frac{13}{5}$, $\cot \theta = \frac{12}{5}$, $\sec \theta = \frac{13}{12}$

35. $\cos \theta = \frac{4}{5}$, $\tan \theta = -\frac{3}{4}$, $\csc \theta = -\frac{5}{3}$, $\sec \theta = \frac{5}{4}$, $\cot \theta = -\frac{4}{3}$

37. $\sin \theta = -\frac{3}{5}$, $\tan \theta = \frac{3}{4}$, $\csc \theta = -\frac{5}{3}$,

$\sec \theta = -\frac{5}{4}$, $\cot \theta = \frac{4}{3}$

39. $\sin(-7\pi) = 0$, $\cos(-7\pi) = -1$, $\tan(-7\pi) = 0$, $\csc(-7\pi)$ is undefined, $\sec(-7\pi) = -1$, $\cot(-7\pi)$ is undefined

41. $\sin \frac{7\pi}{2} = -1$, $\cos \frac{7\pi}{2} = 0$, $\tan \frac{7\pi}{2}$ is undefined, $\csc \frac{7\pi}{2} = -1$, $\sec \frac{7\pi}{2}$ is undefined, $\cot \frac{7\pi}{2} = 0$

43. $\sin\left(-\frac{3\pi}{4}\right) = -\frac{1}{\sqrt{2}}$, $\cos\left(-\frac{3\pi}{4}\right) = -\frac{1}{\sqrt{2}}$,

$\tan\left(-\frac{3\pi}{4}\right) = 1$, $\csc\left(-\frac{3\pi}{4}\right) = -\sqrt{2}$,

 83. $\theta_1 \approx 35.8^\circ$, $\theta_2 \approx 54.2^\circ$
 85. Let α and β represent the angles of elevation from the shrub to the shorter and taller buildings, respectively. The distance from the shrub to the shorter building is $100 - x$; thus $\alpha = \arctan \frac{75}{100-x}$. Similarly, $\beta = \arctan \frac{150}{x}$. Because the angles α , θ , and β form a straight angle, $\theta = \pi - \alpha - \beta$. That is,
 $\theta = \pi - \arctan \frac{75}{100-x} - \arctan \frac{150}{x}$.

6.6 EXTENDED AND DISCOVERY EXERCISE (p. 565)

1. The maximum value of θ is 38.7° when $x \approx 6.24$.
 [0, 50, 10] by [0, 50, 10]

CHAPTER 7: Trigonometric Identities and Equations

SECTION 7.1 (pp. 588–591)

1. $\cot \theta = 2$ 3. $\sec \theta = \frac{7}{2}$ 5. $\cos \theta = -\frac{1}{4}$

7. $\frac{\sin^2 \theta}{\cos^2 \theta}$ 9. $\cos^2 \theta$ 11. $\sin \theta + \cos \theta$

13. $\tan \theta = -\frac{3}{4}, \csc \theta = \frac{5}{3}, \sec \theta = -\frac{5}{4}, \cot \theta = -\frac{4}{3}$

15. $\cos \theta = -\frac{7}{25}, \tan \theta = \frac{24}{7}, \csc \theta = -\frac{25}{24}, \sec \theta = -\frac{25}{7}$

17. $\tan \theta = \frac{60}{11}, \cot \theta = \frac{11}{60}, \csc \theta = -\frac{61}{60}, \sec \theta = -\frac{61}{11}$

19. $\sin \theta = \frac{1}{\sqrt{2}}, \cos \theta = -\frac{1}{\sqrt{2}}, \tan \theta = -1, \cot \theta = -1$

21. 1 23. 1 25. 1 27. $\cos^2 \theta$ 29. $\tan^2 \theta$

31. $-\tan \theta$ 33. $\sec \theta$ 35. $\tan^2 \theta$ 37. $\cos x$

39. 1 41. $\sec x - \csc x$ 43. Yes 45. No

47. Quadrant IV 49. Quadrant III 51. Quadrant II

$$53. \sin \theta = -\frac{\sqrt{3}}{2}, \tan \theta = -\sqrt{3}, \csc \theta = -\frac{2}{\sqrt{3}},$$

$$\sec \theta = 2, \cot \theta = -\frac{1}{\sqrt{3}}$$

$$55. \sin \theta = -\frac{11}{61}, \cos \theta = \frac{60}{61}, \cot \theta = -\frac{60}{11},$$

$$\csc \theta = -\frac{61}{11}, \sec \theta = \frac{61}{60}$$

$$57. \cos \theta = \frac{24}{25}, \tan \theta = \frac{7}{24}, \cot \theta = \frac{24}{7}, \csc \theta = \frac{25}{7},$$

$$\sec \theta = \frac{25}{24}$$

$$59. \cos \theta = -\frac{\sqrt{8}}{3}, \tan \theta = \frac{1}{\sqrt{8}}, \cot \theta = \sqrt{8},$$

$$\csc \theta = -3, \sec \theta = -\frac{3}{\sqrt{8}}$$

$$61. \sin \theta = -\frac{35}{37}, \cos \theta = \frac{12}{37}, \tan \theta = -\frac{35}{12},$$

$$\csc \theta = -\frac{37}{35}, \cot \theta = -\frac{12}{35}$$

$$63. \sin \theta = \frac{3}{7}, \cos \theta = -\frac{\sqrt{40}}{7}, \tan \theta = -\frac{3}{\sqrt{40}},$$

$$\sec \theta = -\frac{7}{\sqrt{40}}, \cot \theta = -\frac{\sqrt{40}}{3}$$

$$65. \sin x = \sqrt{1 - \cos^2 x}; \tan x = \frac{\sqrt{1 - \cos^2 x}}{\cos x}$$

$$67. \sin x = -\frac{\tan x}{\sqrt{1 + \tan^2 x}}; \sec x = -\sqrt{1 + \tan^2 x}$$

$$69. \cot x = -\sqrt{\csc^2 x - 1}; \cos x = -\frac{\sqrt{\csc^2 x - 1}}{\csc x}$$

$$71. \cos \theta = \sqrt{1 - x^2}, 0.8586$$

$$73. \sin \theta = -\frac{1}{\sqrt{1 + x^2}}, -0.8899$$

$$75. \tan \theta = \frac{x}{\sqrt{1 - x^2}} \quad 77. -\sin 13^\circ$$

$$79. -\tan \frac{\pi}{11} \quad 81. \sec \frac{2\pi}{5} \quad 83. d = 93,000,000 \csc \theta$$

$$85. (a) \text{ The sum of } L \text{ and } C \text{ equals } 3.$$

$$[0, 10^{-6}, 10^{-7}] \text{ by } [-1, 4, 1]$$

$$(b) \text{ Let } Y_1 = L(t), Y_2 = C(t), \text{ and } Y_3 = E(t).$$

$$E(t) = 3 \text{ for all inputs}$$

X	Y1	Y2	Y3
0	0	0	3
1E-7	.95646	.04354	3
2E-7	.91081	.08919	3
3E-7	.84451	.15549	3
4E-7	.76668	.23332	3
5E-7	.67874	.32126	3
6E-7	.58249	.41751	3

$$(c) E(t) = L(t) + C(t)$$

$$= 3 \cos^2(6,000,000t) + 3 \sin^2(6,000,000t)$$

$$= 3(\cos^2(6,000,000t) + \sin^2(6,000,000t))$$

$$= 3(1) = 3$$

87. (a) The graph has y -axis symmetry. The monthly high temperatures x months before and x months after July are equal.

$[-6, 6, 1]$ by $[0, 100, 10]$ (b) f is even.

X	Y1
-6	50
-5	70
-4	84.641
-3	90
-2	84.641
-1	70
0	50

$$(c) f(-x) = f(x)$$

$$89. (a) P = 16k \cos^2(2\pi t)$$

(b) Let $Y_1 = 32(\cos(2\pi X))^2$. Y_1 has a maximum value of 32 when $t = 0, 0.5, 1, 1.5, 2.0$, and Y_1 has a minimum value of 0 when $t = 0.25, 0.75, 1.25, 1.75$. The spring is either stretched or compressed the most when Y_1 is maximum.

$$[0, 2, 0.5] \text{ by } [-1, 40, 8]$$

$$(c) P = 16k(1 - \sin^2(2\pi t))$$

SECTION 7.2 (pp. 597–598)

$$1. (a) 1 - x^2 \quad (b) \cos^2 \theta$$

$$3. (a) x^2 - x \quad (b) \sec^2 \theta - \sec \theta$$

$$5. (a) (x+1)(x+1) \quad (b) (\cos \theta + 1)(\cos \theta + 1)$$

$$7. (a) x(x-2) \quad (b) \sec t(\sec t - 2)$$

$$9. (a) \frac{2}{1-x^2} \quad (b) 2 \csc^2 \theta$$

$$11. (a) \frac{x^2 + y^2}{xy} \quad (b) \sec t \csc t$$

$$13. (a) y^2 + x^2 \quad (b) 1 \quad 15. (a) x \quad (b) \cos \theta$$

 121. 2.6, 10.7; near February 17 and October 22
 123. (a) $f(x) = 122.3 \sin(0.524x - 1.7) + 367$ (answers may vary)
 (b) $2.98 \leq x \leq 9.51$ (approximately). At 50°N latitude, the maximum number of monthly hours of sunshine is greater than or equal to 350 hours roughly from March through September.

125. 0.26

127. (a) $[0, 0.01, 0.005]$ by $[-0.005, 0.005, 0.001]$ $[0, 0.01, 0.005]$ by $[-0.005, 0.005, 0.001]$

$[0, 0.01, 0.005]$ by $[-0.005, 0.005, 0.001]$

(b) Maximum: $P \approx 0.004$

(c) No; the maximum of P_1 is 0.003, and the maximum of P_2 is 0.002.

SECTION 7.4 (pp. 621–623)

1. $\frac{\sqrt{6} - \sqrt{2}}{4}$ 3. $2 - \sqrt{3}$ 5. $\frac{\sqrt{6} - \sqrt{2}}{4}$

7. $\frac{\sqrt{6} - \sqrt{2}}{4}$ 9. $\frac{\sqrt{6} + \sqrt{2}}{4}$

11. (a) Graphical: Graphs of $y = \sin(t + \frac{\pi}{2})$ and $y = \cos t$ are the same.

Verbal: If the sine graph is translated $\frac{\pi}{2}$ units left, it coincides with the cosine graph.

(b) $\sin(t + \frac{\pi}{2}) = \sin t \cos \frac{\pi}{2} + \cos t \sin \frac{\pi}{2}$
 $= \sin t(0) + \cos t(1)$
 $= \cos t$

13. (a) Graphical: Graphs of $y = \cos(t + \pi)$ and $y = -\cos t$ are the same.

Verbal: If the cosine graph is translated π units left, it coincides with the cosine graph reflected about the x -axis.

(b) $\cos(t + \pi) = \cos t \cos \pi - \sin t \sin \pi$
 $= \cos t(-1) - \sin t(0)$
 $= -\cos t$

15. (a) Graphical: Graphs of $y = \sec(t - \frac{\pi}{2})$ and $y = \csc t$ are the same.

Verbal: If the secant graph is translated $\frac{\pi}{2}$ units right, it coincides with the cosecant graph.

(b) $\sec(t - \frac{\pi}{2}) = \frac{1}{\cos(t - \frac{\pi}{2})}$

$= \frac{1}{\cos t \cos \frac{\pi}{2} + \sin t \sin \frac{\pi}{2}}$

$= \frac{1}{\cos t(0) + \sin t(1)}$

$= \frac{1}{\sin t}$
 $= \csc t$

17. $\sin(\frac{\pi}{2} - t) = \sin \frac{\pi}{2} \cos t - \cos \frac{\pi}{2} \sin t$
 $= (1) \cos t + (0) \sin t$
 $= \cos t$

19. $\sec(\frac{\pi}{2} - t) = \frac{1}{\cos(\frac{\pi}{2} - t)}$

$= \frac{1}{\cos \frac{\pi}{2} \cos t + \sin \frac{\pi}{2} \sin t}$

$= \frac{1}{(0) \cos t + (1) \sin t}$

$= \frac{1}{\sin t}$
 $= \csc t$

49. (a) $\beta = 96^\circ$, $a \approx 7.8$, $c \approx 12.0$

(b) $\beta \approx 25.4^\circ$, $\gamma \approx 123.6^\circ$, $c \approx 9.7$

(c) $\alpha \approx 47.0^\circ$, $\gamma \approx 77.0^\circ$, $b \approx 6.8$

(d) $\alpha \approx 46.6^\circ$, $\beta \approx 57.9^\circ$, $\gamma \approx 75.5^\circ$

51. (a) 25 (b) $\langle -31, 96 \rangle$ (c) -323

(d) About 173.6°

53.

55. (a) 48 ft/sec; 120 ft/sec (b) From 1 to 3 seconds the car's average speed is 48 feet per second, and from 4 to 6 seconds the car's average speed is 120 feet per second.

57. 15 by 19 inches

59. 12 by 6 by 4 inches or 7.4 by 3.7 by 10.5 inches

61. (a) $C(t) = 630(t - 1980) + 3600$

(b) About 1992, which is one year from the actual value

63. 2.5 feet 65. 56.2°

67. (a) About 247 feet (b) About 18,988 ft^2

69. About 249.4 feet

CHAPTER 9: Systems of Equations and Inequalities

SECTION 9.1 (pp. 745–750)

1. 20; the area of a triangle with base 5 and height 8 is 20.

3. 13 5. -18 7. $\frac{4}{5}$ 9. $f(x, y) = y + 2x$

11. $f(x, y) = \frac{xy}{1+x}$ 13. $x = \frac{4y+7}{3}$; $y = \frac{3x-7}{4}$

15. $x = y^2 + 5$; $y = \pm\sqrt{x-5}$ 17. $x = 2y$; $y = \frac{x}{2}$

19. (2, 1); linear 21. (4, -3); nonlinear

23. (2, 2) 25. $(\frac{1}{2}, -2)$

27. $x - y = 2$, $2x + 2y = 38$, where x is width and y is height; 10.5 in. wide, 8.5 in. high

29. $x + y = 75$, $4x + 7y = 456$, where x is the number of child tickets and y is the number of adult tickets; 23 child tickets, 52 adult tickets 31. Consistent with solution (2, 2)

33. Inconsistent; no solutions

No solutions; inconsistent

37.

(2, -1); consistent, independent

39.

$(-2, 2)$; consistent, independent

41.

$\{(x, y) \mid 2x - y = -4\}$; consistent, dependent

43. $(-2, 1)$ 45. $(\frac{1}{2}, 2)$ 47. (6, 8)

49. $\{(x, y) \mid 3x - 2y = 5\}$ 51. No solutions

53. (4, 3) 55. $(-2, 4)$, (0, 0) 57. (2, 4), (4, 2)

59. (2, 4), $(-2, -4)$ 61. No real solutions

63. $\{(x, y) \mid 2x^2 - y = 5\}$ 65. $(-2, 0)$, (2, 0)

67. $(-2, -2)$, (0, 0), (2, 2) 69. $l = 7$, $w = 5$

71. (14, 6); consistent, independent

73. (1, 3); consistent, independent

75. $\{(x, y) \mid x + y = 500\}$; consistent, dependent

77. No solutions; inconsistent

79. $(-\frac{11}{7}, \frac{12}{7})$; consistent, independent

81. (2, -4) 83. $\{(x, y) \mid 7x - 3y = -17\}$

85. No solutions 87. (10, 20)

89. (2, 1) 91. $(-5, -4)$ 93. (3, 3), $(-3, 3)$

95. (4, 3), $(-4, 3)$, (3, 4), $(-3, 4)$

97. (2, 0), $(-2, 0)$ 99. $(-\sqrt{8}, -\sqrt{8})$, $(\sqrt{8}, \sqrt{8})$

101. (6, 2), $(-2, -6)$ 103. (1, -1) 105. (1, 2)

107. $(-1.588, 0.239)$, (0.164, 1.487), (1.924, -0.351)

109. (1.220, 0.429) 111. (0.714, -0.169)

113. (a) $x + y = 670$, $x - y = 96$ (b) (383, 287)

(c) Consistent; independent

115. $W_1 = \frac{300}{1 + \sqrt{3}} \approx 109.8 \text{ lb}$,

$W_2 = \frac{300\sqrt{3}}{\sqrt{6} + \sqrt{2}} \approx 134.5 \text{ lb}$

117. $r \approx 1.538 \text{ in}$, $h \approx 6.724 \text{ in}$.

119. 12 by 12 by 4 in. or 9.10 by 9.10 by 6.96 in.

121. (a) $x + y = 831,000$, $x - y = 15,000$

(b) & (c) (423,000, 408,000)

123. (a) $x + y = 3000$, $0.08x + 0.10y = 264$

(b) \$1800 at 8%; \$1200 at 10%

125. There are no solutions. If loans totaling \$3000 are at 10%, then the interest must be \$300.

127. (a) $l = 13 \text{ ft}$, $w = 7 \text{ ft}$ (b) $A = 20w - w^2$

(c) 100 ft^2 ; a square pen will provide the largest area.

129. Airplane: 520 mi/hr; wind speed: 40 mi/hr

131. 53,077 deaths in WWI; 291,923 deaths in WWII

133. (a) First model: about 245 lb; second model: about 253 lb

(b) Models agree when $h \approx 65.96 \text{ in}$.

(c) First model: 7.46 lb; second model: 7.93 lb

135. About 1.77 m^2 137. $S(60, 157.48) \approx 1.6 \text{ m}^2$

139. 0.51 141. 32.4

143. Approximately 10,823 watts

145. Approximately 2.54 cords

147. $S(w, h) = 0.0101w^{0.425}h^{0.725}$

SECTION 9.2 (pp. 759–762)

13. c; (2, 3) (answers may vary)

15. d; (-1, -1) (answers may vary)

17. (0, 2)
(answers may vary)

19. (0, 0)
(answers may vary)

21. (-1, 1) (answers may vary)

35. $x = 300, y = 350$

37. This individual weighs less than recommended for his or her height.

39. $25h - 7w \leq 800, 5h - w \geq 170$

45. Maximum: 65; minimum: 8
 47. Maximum: 66; minimum: 3
 49. Maximum: 100; minimum: 0
 51. $x + y \leq 4, x \geq 0, y \geq 0$
 53. Minimum: 6
 55. Maximum: $z = 56$; minimum: $z = 24$
 57. 25 radios, 30 CD players
 59. 2.4 units of Brand A, 1.2 units of Brand B
 61. \$600 63. Part X: 9, part Y: 4

CHECKING BASIC CONCEPTS FOR SECTIONS 9.1 AND 9.2 (p. 762)

1. $d(13, 18) = 20$ 3. $y = \pm \sqrt{z - x^2}$
 5.

7. (a) $x + y = 32, 1.9x - y = 0$
 (b) Approximately (11, 21); in 1999 about 11 million television sets were sold with stereo sound and about 21 million were sold without stereo sound.

SECTION 9.3 (pp. 768–770)

1. No 3. 2 5. (0, 2, -2) is not, but (-1, 3, -2) is a solution. 7. Both are solutions.
 9. (1, 2, 3) 11. (1, 0, 1) 13. $(\frac{1}{2}, \frac{1}{2}, -2)$
 15. $(\frac{z+3}{2}, \frac{-z+3}{2}, z)$
 17. No solutions 19. $(-\frac{5}{2}, -2, 4)$
 21. No solutions 23. $(-\frac{1}{2}, \frac{1}{2}, -\frac{1}{2})$
 25. $(\frac{-5z+18}{13}, \frac{-6z+19}{13}, z)$
 27. $(8, -11, -\frac{1}{2})$ 29. (2, 3, -4)
 31. 120 child, 280 student, and 100 adult tickets
 33. No solutions; at least one student was charged incorrectly.
 35. (a) $x + y + z = 180$
 $x - z = 25$
 $-x + y + z = 30$
 (b) $75^\circ, 55^\circ, 50^\circ$
 37. \$2500 at 5%, \$7500 at 7%, \$10,000 at 10%
 39. (a) $N + P + K = 80$
 $N + P - K = 8$
 $9P - K = 0$
 (b) (40, 4, 36); 40 lb of nitrogen, 4 lb of phosphorus, 36 lb of potassium

SECTION 9.4 (pp. 783–787)

1. (a) 3×1 (b) 2×3 (c) 2×2
 3. Dimension: 2×3 5. Dimension: 3×4

$$\begin{bmatrix} 5 & -2 & 3 \\ -1 & 3 & -1 \end{bmatrix}$$

$$\begin{bmatrix} -3 & 2 & 1 & -4 \\ 5 & 0 & -1 & 9 \\ 1 & -3 & -6 & -9 \end{bmatrix}$$

 7. $3x + 2y = 4$
 $y = 5$
 9. $3x + y + 4z = 0$
 $5y + 8z = -1$
 $-7z = 1$
 11. (a) Yes (b) No (c) Yes
 13. (5, -1) 15. (2, 0) 17. (2, 3, 1)
 19. $(3 - 3z, 1 + 2z, z)$
 21. No solutions

$$\begin{bmatrix} 1 & -2 & 3 & 5 \\ -3 & 5 & 3 & 2 \\ 1 & 2 & 1 & -2 \end{bmatrix}$$
 23.
$$\begin{bmatrix} 1 & -1 & 1 & 2 \\ 0 & 1 & -1 & 2 \\ 0 & 8 & -1 & 3 \end{bmatrix}$$

 27. (-17, 10) 29. (0, 2, -1) 31. (-1, 2, 4)
 33. (3, 2, 1) 35. No solutions
 37. $(-1 - z, \frac{9 - 5z}{2}, z)$
 39. (1, 1, 1) 41. $(\frac{1}{2}, -\frac{1}{2}, 4)$ 43. (-2, 5, -1)
 45. No solutions 47. (-1, -2, 3)
 49. $(\frac{3z+1}{7}, \frac{11z-15}{7}, z)$ 51. (12, 3)
 53. $(-2, 4, \frac{1}{2})$ 55. $(4 - 2z, z - 3, z)$
 57. No solutions 59. (3, 2) 61. (-2, 1, 3)
 63. (-2, 5, 7) 65. No solutions
 67. (-9.226, -9.167, 2.440)
 69. (5.211, 3.739, -4.655)
 71. (7.993, 1.609, -0.401)
 73. (a) $F = 0.5714N + 0.4571R - 2014$ (b) \$5700
 75. Pump 1: 12 hours; pumps 2 and 3: 24 hours
 77. (3.53, 1.62, 1.91)
 79. (a) $x + y + z = 5000$
 $x + y - z = 0$
 $0.08x + 0.11y + 0.14z = 595,$
 where x is amount invested at 8%, y is amount invested at 11%, and z is amount invested at 14%
 (b) \$1000 at 8%; \$1500 at 11%; \$2500 at 14%
 81. (a) At intersection A, incoming traffic is equal to $x + 5$. The outgoing traffic is given by $y + 7$. Therefore, $x + 5 = y + 7$. The other equations can be justified in a similar way.
 (b) The three equations can be written as
 $x - y = 2$
 $x - z = 3$
 $y - z = 1$
 The solution can be written as $\{(z + 3, z + 1, z) | z \geq 0\}$.
 (c) There are infinitely many solutions, since some cars could be driving around the block continually.

83. (a) $c = 3$

$4a + 2b + c = 55$

$16a + 4b + c = 150$

(b) $f(x) = 5.375x^2 + 15.25x + 3$

(c) $[-0.5, 5, 1]$ by $[-10, 175, 25]$

(d) In 2012 predicted sales are $f(8) = 469$ million (answers may vary).

85. (a) $1990^2a + 1990b + c = 11$

$2010^2a + 2010b + c = 10$

$2030^2a + 2030b + c = 6$

(b) $f(x) = -0.00375x^2 + 14.95x - 14,889.125$

(c) $[1985, 2035, 5]$ by $[5, 12, 1]$

(d) In 2015 the predicted ratio is $f(2015) \approx 9.3$ (answers may vary).

9.4 EXTENDED AND DISCOVERY EXERCISES (p. 787)

1. $(1, -1, 2, 0)$

CHECKING BASIC CONCEPTS FOR SECTIONS 9.3 AND 9.4 (p. 787)

1. (a) $(3, 2, -1)$ (b) $(\frac{4-z}{3}, \frac{5-z}{3}, z)$

(c) No solutions 3. $(2, -1, 0)$

SECTION 9.5 (pp. 797-800)

1. (a) $a_{12} = 2, a_{21} = 4, a_{32}$ is undefined. (b) 23

3. (a) $a_{12} = -1, a_{21} = 3, a_{32} = 0$ (b) 13

5. $x = 1, y = 1$ 7. Not possible

9. (a) $a_{12} = 3, b_{32} = 1, b_{22} = 0$ (b) -2 (c) $x = 3$

11. (a) $A + B = \begin{bmatrix} 3 & 3 \\ 3 & 3 \end{bmatrix}$ (b) $B + A = \begin{bmatrix} 3 & 3 \\ 3 & 3 \end{bmatrix}$

(c) $A - B = \begin{bmatrix} 5 & -5 \\ -5 & 5 \end{bmatrix}$

65. $(\frac{2}{\sqrt{11}}, \frac{6}{\sqrt{11}}), (-\frac{2}{\sqrt{11}}, -\frac{6}{\sqrt{11}})$

67. (a) Elliptic (b) Its speed should be 4326 m/sec or greater. (c) If D is larger, then $\frac{k}{\sqrt{D}}$ is smaller, so smaller values for V satisfy $V > \frac{k}{\sqrt{D}}$.

10.3 EXTENDED AND DISCOVERY EXERCISES (pp. 867–868)

1. (a) $x = \sqrt{y^2 + 2.5 \times 10^{-27}}$; this equation represents the right half of the hyperbola. (b) About 1.2×10^{-13} m

CHECKING BASIC CONCEPTS FOR SECTION 10.3 (p. 868)

1. $\frac{x^2}{16} - \frac{y^2}{9} = 1$
3. $\frac{(x-1)^2}{9} - \frac{(y-3)^2}{4} = 1$; $F(1 \pm \sqrt{13}, 3)$

CHAPTER 10 REVIEW EXERCISES (pp. 870–872)

1.

3.

5.

7. d 9. a 11. e

13. $y^2 = 8x$ 15. $\frac{x^2}{25} + \frac{y^2}{9} = 1$ 17. $\frac{y^2}{64} - \frac{x^2}{36} = 1$

19. $F(0, -1)$ 21. $F(\pm\sqrt{21}, 0)$

23. $F(\pm 5, 0)$

25. Both foci are located at $(3, -1)$.

27. Center: $C(1, -1)$

31. $[-5, 5, 1]$ by $[-5, 5, 1]$

Note: If breaks in the graph appear near the vertices, they should not be there. It is a result of the low resolution of the graphing calculator screen.

33. $(y - 0)^2 = -10(x + \frac{7}{2})$

35. $\frac{(x + 1)^2}{25} + \frac{(y - 5)^2}{4} = 1$; center: $C(-1, 5)$; vertices: $V(-6, 5), V(4, 5)$

37. $\frac{(x + 2)^2}{4} - \frac{(y - 3)^2}{1} = 1$; center: $C(-2, 3)$; vertices: $V(-4, 3), V(0, 3)$

39. Four solutions: $(\pm\sqrt{\frac{8}{3}}, \pm\sqrt{\frac{4}{3}})$

41.

43. (a) Minimum: 4.92 million mi; maximum: 995.08 million mi (b) $2\pi\sqrt{\frac{500^2 + 70^2}{2}} \approx 2243$ million miles, or 2.243 billion miles 45. About 29.05 ft

CHAPTER 10 EXTENDED AND DISCOVERY EXERCISES (p. 872)

1. Neptune: 0.271; Pluto: 9.82

3. Neptune: $\frac{(x - 0.271)^2}{30.10^2} + \frac{y^2}{30.10^2} = 1$;

Pluto: $\frac{(x - 9.82)^2}{39.44^2} + \frac{y^2}{38.20^2} = 1$

5. No. Because Pluto's orbit is so eccentric, there is a period of time when Pluto is not farther from the sun. However, its average distance a from the sun is greater.

CHAPTER 11: Further Topics in Algebra

SECTION 11.1 (pp. 883–886)

1. $a_1 = 3, a_2 = 5, a_3 = 7, a_4 = 9$

3. $a_1 = 4, a_2 = -8, a_3 = 16, a_4 = -32$

5. $a_1 = \frac{1}{2}, a_2 = \frac{2}{5}, a_3 = \frac{3}{10}, a_4 = \frac{4}{17}$

7. $a_1 = -\frac{1}{2}, a_2 = \frac{1}{4}, a_3 = -\frac{1}{8}, a_4 = \frac{1}{16}$

9. $a_1 = \frac{2}{3}, a_2 = -\frac{4}{5}, a_3 = \frac{8}{9}, a_4 = -\frac{16}{17}$

11. $a_1 = 3, a_2 = 8, a_3 = 17, a_4 = 32$

13. 2, 4, 3, 5, 3, 6, 4

15. (a) $a_1 = 1, a_2 = 2, a_3 = 4, a_4 = 8$

(b) $[0, 5, 1]$ by $[0, 9, 1]$

17. (a) $a_1 = -3, a_2 = 0, a_3 = 3, a_4 = 6$
 (b) $[0, 5, 1]$ by $[-4, 7, 1]$

19. (a) $a_1 = 2, a_2 = 5, a_3 = 14, a_4 = 41$
 (b) $[0, 5, 1]$ by $[0, 45, 5]$

21. (a) $a_1 = 2, a_2 = 5, a_3 = 3, a_4 = -2$

39. (a)

n	1	2	3	4	5	6	7	8
a_n	$\frac{1}{4}$	$-\frac{1}{2}$	-1	-2	-4	-8	-16	-32

- (b) $[0, 9, 1]$ by $[-36, 4, 4]$ (c) $a_n = -\frac{1}{4}(2)^{n-1}$

41. $a_n = -2n + 7$ 43. $a_n = 3n - 8$

45. $a_n = 2n + 1$ 47. $a_n = 3n + 5$

49. $a_n = 0.5n - 6.5$ 51. $a_n = 2\left(\frac{1}{2}\right)^{n-1}$

53. $a_n = \frac{1}{2}\left(-\frac{1}{4}\right)^{n-1}$ 55. $a_n = 8\left(\frac{1}{2}\right)^{n-1}$

57. $a_n = -5(-5)^{n-1}$ 59. $a_n = -\frac{1}{2}(2)^{n-1}$

61. No 63. Yes 65. Yes 67. Yes

69. Yes 71. No 73. No 75. No

77. Arithmetic 79. Geometric 81. Neither

83. Arithmetic, $d < 0, d = -1$

85. Geometric, $r < 0, |r| < 1$

87. The insect population density increases rapidly and then levels off near 5000 per acre.

89. (a) $a_n = 0.8a_{n-1}$, $a_1 = 500$ (b) $a_1 = 500$, $a_2 = 400$, $a_3 = 320$, $a_4 = 256$, $a_5 = 204.8$, and $a_6 = 163.84$. The population density decreases by 20% each year. (c) $a_n = 500(0.8)^{n-1}$

91. (a) $a_1 = 8$, $a_2 = 10.4$, $a_3 = 8.528$

(b) $[0, 21, 1]$ by $[0, 14, 1]$

The population density oscillates above and below approximately 9.5.

93. (a) 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144

(b) $\frac{a_2}{a_1} = 1$, $\frac{a_3}{a_2} = 2$, $\frac{a_4}{a_3} = 1.5$, $\frac{a_5}{a_4} = \frac{5}{3} \approx 1.6667$,

$\frac{a_6}{a_5} = \frac{8}{5} = 1.6$, $\frac{a_7}{a_6} = \frac{13}{8} = 1.625$, $\frac{a_8}{a_7} = \frac{21}{13} \approx 1.6154$,

$\frac{a_9}{a_8} = \frac{34}{21} \approx 1.6190$, $\frac{a_{10}}{a_9} = \frac{55}{34} \approx 1.6176$,

$\frac{a_{11}}{a_{10}} = \frac{89}{55} \approx 1.6182$, and $\frac{a_{12}}{a_{11}} = \frac{144}{89} \approx 1.6180$.

The ratio appears to approach a number near 1.618.

(c) $n = 2$: $a_1 \cdot a_3 - a_2^2 = (1)(2) - (1)^2 = 1 = (-1)^2$

$n = 3$: $a_2 \cdot a_4 - a_3^2 = (1)(3) - (2)^2 = -1 = (-1)^3$

$n = 4$: $a_3 \cdot a_5 - a_4^2 = (2)(5) - (3)^2 = 1 = (-1)^4$

95. (a) $a_n = 2000n + 28,000$, or

$a_n = 30,000 + 2000(n - 1)$; arithmetic

(b) $b_n = 30,000(1.05)^{n-1}$; geometric

(c) Since $a_{10} = \$48,000 > b_{10} \approx \$46,540$, the first salary is higher after 10 years. Since $a_{20} = \$68,000 < b_{20} \approx \$75,809$, the second salary is higher after 20 years.

(d) With time, the geometric sequence with $r > 1$ overtakes the arithmetic sequence.

$[0, 30, 10]$ by $[0, 150,000, 50,000]$

97. $a_6 \approx 1.414213562$, $\sqrt{2} \approx 1.414213562$

99. $a_6 = 4.582581971$, $\sqrt{21} \approx 4.582575695$

101. By definition,

$a_n = a_1 + (n - 1)d_1$ and $b_n = b_1 + (n - 1)d_2$.

Then $c_n = a_n + b_n$

$$= [a_1 + (n - 1)d_1] + [b_1 + (n - 1)d_2]$$

$$= (a_1 + b_1) + [(n - 1)d_1 + (n - 1)d_2]$$

$$= (a_1 + b_1) + (n - 1)(d_1 + d_2)$$

$$= c_1 + (n - 1)d,$$

where $c_1 = a_1 + b_1$ and $d = d_1 + d_2$.

 45. $84a^6b^3$ 47. $70x^4y^4$ 49. $40x^2y^3$ 51. $-576xy^5$

CHECKING BASIC CONCEPTS FOR SECTIONS 11.3
AND 11.4 (p. 916)

1. $2^8 = 256$ 3. $26 \cdot 36^5 = 1,572,120,576$

SECTION 11.5 (pp. 922–923)

1. $3 + 6 + 9 + \cdots + 3n = \frac{3n(n+1)}{2}$
 (i) Show that the statement is true for $n = 1$:
 $3(1) = \frac{3(1)(2)}{2}$
 $3 = 3$

(ii) Assume that S_k is true:

$$3 + 6 + 9 + \cdots + 3k = \frac{3k(k+1)}{2}$$

Show that S_{k+1} is true:

$$3 + 6 + \cdots + 3(k+1) = \frac{3(k+1)(k+2)}{2}$$

Add $3(k+1)$ to each side of S_k :

$$3 + 6 + 9 + \cdots + 3k + 3(k+1)$$

$$= \frac{3k(k+1)}{2} + 3(k+1)$$

$$= \frac{3k(k+1) + 6(k+1)}{2}$$

$$= \frac{(k+1)(3k+6)}{2}$$

$$= \frac{3(k+1)(k+2)}{2}$$

Since S_k implies S_{k+1} , the statement is true for every positive integer n .

15. 1, 2 17. 2, 3, 4

$$19. (a^m)^n = a^{mn}$$

(i) Show that the statement is true for $n = 1$:

$$(a^m)^1 = a^{m \cdot 1}$$

$$a^m = a^m$$

(ii) Assume that S_k is true:

$$(a^m)^k = a^{mk}$$

Show that S_{k+1} is true:

$$(a^m)^{k+1} = a^{m(k+1)}$$

Multiply each side of S_k by a^m :

$$(a^m)^k \cdot (a^m)^1 = a^{mk} \cdot a^m$$

$$(a^m)^{k+1} = a^{mk+m}$$

$$(a^m)^{k+1} = a^{m(k+1)}$$

Since S_k implies S_{k+1} , the statement is true for every positive integer n .

$$31. P = 3\left(\frac{4}{3}\right)^{n-1} \quad 33. 2^n - 1$$

55. $\frac{3}{51} = \frac{1}{17}$ 57. $\frac{1}{3}$ 59. $\frac{19}{27}$ 61. 40% 63. $\frac{1}{3}$

65. (a) $\frac{18}{235}$ (b) $\frac{7}{18}$ (c) $\frac{7}{235}$

67. (a) $\frac{8}{15}$ (b) $\frac{7}{15}$ (c) $\frac{2}{5}$ (d) $\frac{1}{3}$ (e) $\frac{1}{15}$

CHECKING BASIC CONCEPTS FOR SECTIONS 11.5 AND 11.6 (p. 935)

1. $4 + 8 + 12 + \cdots + 4n = 2n(n + 1)$

(i) Show that the statement is true for $n = 1$:

$4(1) = 2(1)(1 + 1)$

$4 = 4$

(ii) Assume that S_k is true:

$4 + 8 + 12 + \cdots + 4k = 2k(k + 1)$

Show that S_{k+1} is true:

$4 + 8 + \cdots + 4(k + 1) = 2(k + 1)(k + 2)$

Add $4(k + 1)$ to each side of S_k :

$4 + 8 + 12 + \cdots + 4k + 4(k + 1)$

$= 2k(k + 1) + 4(k + 1)$

$= 2k^2 + 6k + 4$

$= 2(k + 1)(k + 2)$

Since S_k implies S_{k+1} , the statement is true for every positive integer n .

3. $\frac{1}{16}$ 5. $\frac{\binom{4}{4} \cdot \binom{4}{1}}{\binom{52}{5}} = \frac{4}{2,598,960} \approx 0.0000015$

CHAPTER 11: REVIEW EXERCISES (pp. 939–940)

1. $-1, -4, -7, -10$ 3. $0, 1, 3, 7$

5. $5, 3, 1, 2, 4, 6$

7. (a)

n	1	2	3	4	5	6	7	8
a_n	3	1	1	3	5	7	9	-11

(b) $[0, 10, 1]$ by $[-12, 4, 1]$

(c) $a_n = -2n + 5$

9. $a_n = 4n - 15$ 11. Arithmetic 13. Geometric

15. 65 17. 90 19. 3280 21. 3

23. $6 + 11 + 16 + 21 + 26$

25. $\sum_{k=1}^6 k^3$ 27. -1155

29. $0.18 + 0.0018 + 0.000018 + \cdots$

31. 120

33. $1 + 3 + 5 + \cdots + (2n - 1) = n^2$

(i) Show that the statement is true for $n = 1$:

$2(1) - 1 = 1^2$

$1 = 1$

(ii) Assume that S_k is true:

$1 + 3 + 5 + \cdots + (2k - 1) = k^2$

Show that S_{k+1} is true:

$1 + 3 + \cdots + (2(k + 1) - 1) = (k + 1)^2$

Add $2k + 1$ to each side of S_k :

$1 + 3 + 5 + \cdots + (2k - 1) + (2k + 1)$

$= k^2 + 2k + 1$

$= (k + 1)^2$

Since S_k implies S_{k+1} , the statement is true for every positive integer n .

35. $\frac{1}{2}$ 37. 120 39. $4^{20} \approx 1.1 \times 10^{12}$ 41. 6,250,000

43. (a) 4, 3.6, 3.24, 2.916, 2.6244; geometric

(b) $[0, 6, 1]$ by $[0, 6, 1]$ (c) $a_n = 4(0.9)^{n-1}$

45. 20 47. 210 49. $\frac{91}{120} \approx 0.758$

51. (a) $\frac{27}{60} = 0.45$ (b) $\frac{33}{60} = 0.55$ (c) $\frac{13}{60} \approx 0.217$

53. The population density grows slowly initially, then increases rapidly, and finally levels off near 4,000,000 per acre.

$[0, 16, 1]$ by $[0, 5000, 1000]$

CHAPTER 11 EXTENDED AND DISCOVERY EXERCISES

(pp. 940–941)

1. (a) $P = \begin{bmatrix} 1 & 0 & 0 \\ \frac{1}{6} & \frac{2}{3} & \frac{1}{6} \\ 0 & 0 & 1 \end{bmatrix}$

(b) The greatest probabilities lie on the main diagonal: $1, \frac{2}{3}, 1$; this means that a mother cell is most likely to produce a daughter cell like itself (answers will vary).

3. The quantity $\frac{a_1 + a_n}{2}$ represents not only the average of a_1 and a_n , but also the average of the terms $a_1, a_2, a_3, \dots, a_n$. This is true whether n is odd or even. The total sum is equal to n times the average of the terms.

CHAPTERS 1–11 CUMULATIVE REVIEW EXERCISES

(pp. 941–946)

1. 3.45×10^4 ; 0.000152 3. $\sqrt{41}$

5. (a) 2; $\sqrt{-a}$ (b) $D = \{x | x \leq 1\}$, or $(-\infty, 1]$

 45. $2n\sqrt{2n}$ 47. $2ab^2\sqrt{3b}$ 49. $-5xy\sqrt[3]{xy^2}$
 51. $5\sqrt[3]{5t^2}$ 53. $\frac{3t}{r\sqrt[3]{5r^3}}$ 55. $\sqrt[6]{3^5}$ 57. $2\sqrt[12]{2^5}$
 59. $x\sqrt[12]{x}$ 61. $\sqrt[12]{r^{11}t^7}$ 63. $9\sqrt{3}$ 65. $2\sqrt{x} - \sqrt{y}$
 67. $-5\sqrt[3]{6}$ 69. $9\sqrt{7}$ 71. $-2\sqrt{11}$ 73. $5\sqrt[3]{2} - \sqrt{2}$
 75. $-\sqrt[3]{xy}$ 77. $3\sqrt{x+2}$ 79. $\frac{71\sqrt{2}}{10}$
 81. $4\sqrt[3]{b(5b-1)}$ 83. $20\sqrt{3z}$ 85. $(3ab-1)\sqrt[4]{ab}$
 87. $(n-2)\sqrt[3]{n}$ 89. 2 91. $x-64$ 93. $ab-c$
 95. $x + \sqrt{x} - 56$ 97. $\frac{4\sqrt{3}}{3}$ 99. $\frac{\sqrt{5}}{3}$ 101. $\frac{\sqrt{3b}}{6}$
 103. $\frac{3+\sqrt{2}}{7}$ 105. $\sqrt{10} - 2\sqrt{2}$ 107. $\sqrt{7} + \sqrt{6}$
 109. $\frac{z+3\sqrt{z}}{z-9}$ 111. $\frac{a+2\sqrt{ab}+b}{a-b}$

APPENDIX C: Partial Fractions (p. AP-30)

1. $\frac{5}{3x} + \frac{-10}{3(2x+1)}$ 3. $\frac{6}{5(x+2)} + \frac{8}{5(2x-1)}$
 5. $\frac{5}{6(x+5)} + \frac{1}{6(x-1)}$
 7. $\frac{-2}{x+1} + \frac{2}{x+2} + \frac{4}{(x+2)^2}$ 9. $\frac{4}{x} + \frac{4}{1-x}$
 11. $\frac{15}{x} + \frac{-5}{x+1} + \frac{-6}{x-1}$ 13. $1 + \frac{-2}{x+1} + \frac{1}{(x+1)^2}$
 15. $x^3 - x^2 + \frac{-1}{3(2x+1)} + \frac{2}{3(x+2)}$
 17. $\frac{1}{9} + \frac{-1}{x} + \frac{25}{18(3x+2)} + \frac{29}{18(3x-2)}$
 19. $\frac{-3}{5x^2} + \frac{3}{5(x^2+5)}$ 21. $\frac{-2}{7(x+4)} + \frac{6x-3}{7(3x^2+1)}$
 23. $\frac{1}{4x} + \frac{-8}{19(2x+1)} + \frac{-9x-24}{76(3x^2+4)}$
 25. $\frac{-1}{x} + \frac{2x}{2x^2+1} + \frac{2x+3}{(2x^2+1)^2}$
 27. $\frac{-1}{x+2} + \frac{3}{(x^2+4)^2}$
 29. $5x^2 + \frac{3}{x} + \frac{-1}{x+3} + \frac{2}{x-1}$

APPENDIX D: Rotation of Axes (p. AP-36)

1. Circle or ellipse or a point
 3. Hyperbola or two intersecting lines
 5. Parabola or one line or two parallel lines
 7. 30° 9. 60° 11. 22.5°

13.

15.

17.

Index of Applications

AGRICULTURE

Farm pollution, 110
Fertilizer, 468, 770
Irrigation and yield, 246
Land owned, 453
Modeling plant growth, 754
Raising animals, 762
Rancher fencing area for cattle, 178, 185
Tree growth, 460, 468

ASTRONOMY

Circumference of Earth, 491–492
Comets, 843, 871
Diameter of the moon, 491
Distance between a satellite and a tracking station, 669
Distance to a star, 497–498, 503, 590
Distance to the moon, 649–650, 656
Distance to the sun, 4
Distances and eccentricities of planets, 704
Distant galaxies, 94
Earth's rotation, 490
Farthest planet from the sun, 704
Halley's Comet, 857
Heights of lunar mountains, 504
Hubble telescope, 339
Intensity of the sun, 532, 536
Light years, 504
Locating the position of a planet, 607
Location of the North Star, 490
Lunar orbits for Jupiter, 351
Maximizing altitude on
 Earth, 185
 Jupiter, 185
 Mars, 185
 Moon, 185
Moons of Jupiter, 477
Observing planets, 504
Orbital height of a GPS satellite, 504
Orbital speed, 6, 11
Orbital velocity, 857
Phases of the moon, 515–516, 520, 564, 571, 602, 611
Planetary orbits, 340, 345, 351, 400, 704, 708, 847–848, 856, 857

Planets' distance from the sun, 872
Radio telescope, 836, 842
Refraction of starlight, 532, 536
Satellite orbits, 857, 867
Simulating gravity on the moon, 696
Size of the Milky Way, 11
Speed of a GPS satellite, 485
Speed of Earth, 6–7
Speed of light, 13
Sun's orbit, 10
Telescopes, 867
Velocity of a star, 724–725
Velocity of planets, 491
Weight on Mars, 112

AUTOMOTIVE

Antifreeze, 129, 163
Auto parts, 800
Braking distance, 61, 202, 338, 368, 521
Car designs, 910
Car sales, 800
Driving, 55
Female mechanics, 466
Headlight, 843
Safe driving speed, 212, 220, 221
Speed of a car, 67, 79–80, 89, 90, 129
Stopping distance, 61, 220, 324, 368–369, 382
Tire pressure, 416, 417, 475
Tire sales, 813
Toyota vehicles sold in the United States, 54, 110
Velocity of a car, 54, 134

BIOLOGY

Age of a fossil, 413
Allometric growth, 339, 446
Allometry and pulse rate, 361
Antibiotic resistance, 940–941
Bacteria growth, 416, 421, 435, 458, 459, 475, 576, 727, 885–886, 943
Bird populations, 285, 300, 468
Decline of the bluefin tuna, 448–449, 457
Diversity of birds and insects, 435
E. coli bacteria, 410–411, 418, 419, 457
Endangered species, 75, 274–275

Fiddler crab size, 339, 352
Fish population, 112–113, 164, 322, 416
Height of a tree, 129
Insect populations, 300, 322, 467, 876, 877–878, 885, 940
Length of a small fish, 310–311
Lifespan of birds, 454–455, 458
Modeling algae growth, 437
Modeling biological rhythms, 516–517, 521
Photosynthesis, 180–181
Pulse rate and weight of animals, 352
Species of birds, 429
Surface area and the human body, 750
Survival rates for animals, 73, 420
Tree density, 419
Weight of a bear, 785
Weight of a small fish, 475
Wing size, 343, 344–345, 351, 468
Wingspan, 347–348, 351, 468
Worms living without moisture, 203
Yeast growth, 462–463

BUSINESS

Break-even point, 137
Business production, 770
Cigarettes sold overseas, 749
Compact discs vs. cassette tape sales, 119
Company's cost for making computers, 167
Consumer Price Index, 187
Cost of producing radios, 363
Cost-benefit, 338
Customers waiting in line, 323, 331
Defective parts, 934
Digital subscriber lines, 27
Gross sales, 734
iPod and iPhone sales, 98–99, 113, 117, 734–735, 770, 786
Leontief economic model, 814
Manufacturing, 130
Maximizing profit, 755, 761, 762
Maximizing revenue, 185, 246, 365, 761
Minimizing cost, 337, 757–758, 761, 762

Music and digital downloads, 44, 77–78
 Music on the Internet, 110
 Online holiday shopping, 130
 Plate glass sales, 814
 Producing a master disc for a DVD,
 371–372, 382
 Profit, 136, 381
 Quality control, 932–933, 940
 Revenue, 198
 Revenue, cost and profit, 382
 Sales tax, 106, 112
 Super Bowl ads, 131
 U.S. advertising expenditures, 88
 U.S. vehicle production, 88
 Vinyl and CD sales, 128
 Worldwide cigarette sales, 27

CHEMISTRY

Celsius temperature of water, 398
 Cooling an object, 436, 458, 460
 Dissolving salt, 446
 Half-life, 412, 415
 Mixing acid, 124–125, 129, 365
 Newton's Law of Cooling, 458, 475
 Radioactive decay, 412–413, 459, 475
 Radioactive substances, 415, 419, 420,
 459
 Structure of an atom, 867
 Temperature and volume of helium, 131
 Warming an object, 437, 458
 Weight of an electron, 10

COMBINATORIES

Access codes, 909
 Birthdays, 906, 910
 Book arrangements, 910, 911
 Cards, 911, 916
 Combination lock, 909, 940
 Committees, 907–908, 910, 940
 Dice, 909
 Dinner choices, 909
 Exam questions, 901–902, 909,
 910–911, 916, 940
 Garage door openers, 909
 Giving a speech, 905, 910, 940
 Keys on a key ring, 910
 License plates, 902, 909, 916, 940, 945
 Lottery, 907, 909, 910
 Poker hands, 916
 Radio station call letters, 909
 Selecting courses, 907
 Selecting marbles, 911

Sitting at a round table, 910
 Standing in line, 910, 939
 Telephone numbers, 903, 909, 910
 Traveling salesperson problem,
 904–905, 910

COMMUNICATION

Broadcasting patterns, 708
 Cellular phones, 94
 Communications satellite coverage, 565
 GPS satellite communication, 536–537
 Radio stations, 4, 467
 Radio tuners, 582, 590
 Telecommuting, 466–467

COMPUTERS

Broadband Internet connections, 144
 Colors on computer monitors, 800–801
 Computer graphics, 238, 247, 669,
 686–687, 692–693, 725–726
 Computer package, 909
 Designing a face, 696
 Designing letters, 695
 Digital photography, 788–789, 790–791,
 798, 799, 829
 Digitizing letters, 799
 Electronic technology, 696–697
 E-mail spam, 110
 Lissajous figures, 696
 Memory requirements, 105–106
 Negative image, 799
 Robotics, 486–487, 489, 506, 507,
 558–559, 564, 565, 667, 676,
 685–686, 724
 Sales of CRT and LCD screens, 130
 Screen dimensions, 202
 Time on the Internet, 748

CONSTRUCTION

Arch bridge, 857, 872
 Building restrictions, 190
 Carpeting, 750
 Construction zone, 322
 Designing a box, 728, 729
 Designing a sag curve, 531
 Designing steps, 564
 Enclosing a pool, 73
 Fencing, 130, 185, 202, 246
 Grade resistance, 509–510, 564, 571
 Height of a building, 502–503, 590
 Height of a tower, 658
 Height of the Gateway Arch, 658

Highway design and curves, 464,
 498–499, 504, 505, 521, 536,
 606–607, 611, 638–639, 657, 668
 Highway grade, 509–510, 520, 521,
 560, 571, 572
 Lumber costs, 93
 Roman Colosseum, 857
 Roof pitch, 553, 564
 Roof trusses, 740–741, 748
 Strength of a beam, 112, 339, 750
 Surveying, 491, 498, 503, 571–572,
 657, 658, 660, 662, 666, 729, 946
 Suspension bridge, 186
 Thickness of cement, 12
 Thickness of paint, 73
 Thickness of runways, 420, 448
 Truss construction, 652–653, 656, 661,
 667
 Weight of a load of gravel, 167
 Window dimensions, 129, 202

CONSUMER ISSUES

Cell phone subscribers, 26, 145
 Consumer spending, 145
 Cost of compact discs, 112, 769, 813,
 829
 Cost of driving, 43, 110, 163, 363
 First-class mail, 92
 Group rates for airline tickets, 365
 Lake property, 418
 Monthly electric bill, 89
 Online betting, 145
 Ordering shirts, 203
 Pet food cost, 761
 Price of carpet, 53, 94, 378
 Price of landscape rock, 53
 Prices of homes, 144, 238, 770, 813
 Rental company charges, 84
 Room prices, 246
 Sale price, 128
 Students buying lunch, 766, 767, 769
 U.S. alcohol consumption, 66
 U.S. cigarette consumption, 66
 Value of a house, 128, 416

EDUCATION

ACT scores, 163
 College classes, 933
 College tuition and fees, 9, 11, 17, 47,
 74, 79–80, 103, 110, 112, 120,
 128, 238, 418, 420, 467, 576, 729,
 800, 830

Completing at least four years of high school, 9
 Cost per credit, 166, 793
 Course grades, 162
 Course schedule, 910
 Educational attainment and income, 33, 44
 Grades, 129
 Guessing the correct answer on a test, 932
 Head Start enrollment, 187, 786
 High school enrollment, 95
 High school graduates, 935
 Projected cost of college, 109
 Student loans, 749, 829
 Students and classes, 926, 930, 935
 Test scores, 475
 U.S. population with four or more years of college, 392

ENERGY

Amperage, 520
 Electricity, 623, 638, 644, 696, 785
 Energy in an oscillating spring, 590–591
 Fuel consumption, 91
 Heating costs, 259
 Household current, 516
 Oil consumption, 119
 Solar heater, 843
 Solar panels, 685
 Solar power plant, 491
 U.S. energy consumption, 259, 748
 U.S. natural gas consumption, 259, 261, 266, 268–269, 274
 Voltage, 520
 Wattage, 629–630
 Wind power, 750

ENGINEERING

Aerial photography, 502, 648–649, 656, 724, 725
 Distance across a river, lake or canyon, 656, 657, 666
 Electrical circuits, 274, 308, 718–719
 Electrical resistance, 112, 339
 Flow rates, 164
 Height of a streetlight, 123–124
 Height of an antenna, 503
 iPod memory, 49
 Railroad track curves, 74
 Relative error, 156, 164, 168
 Satellite dish, 842, 946

Two cycle engines, 130
 Voltage of a circuit, 458

ENTERTAINMENT

Admission prices to a movie, 746
 Cable modems, 27
 Cable TV subscribers, 16
 DVD rentals, 352
 Ferris wheel, 397, 490, 571
 Human cannonball, 146, 156
 Movie attendance, 184
 Movie screen, 565
 Music, 23, 56, 552, 612
 Musical chairs seating, 910
 Nielsen rating, 9
 Recording digital music, 105–106
 Satellite TV, 830
 Television sets, 746, 762
 Ticket sales to a play, 765–766, 769, 787
 Titles released for DVD rentals, 237
 Tower of Hanoi, 923

ENVIRONMENTAL ISSUES

Acid rain, 164, 384, 436
 Air density, 220
 Air pollution, 400
 Airliner carbon dioxide emissions, 81
 Antarctic ozone layer, 112
 Atmospheric carbon dioxide, 26, 411–412, 786–787
 Atmospheric density, 467
 Atmospheric pressure, 461
 Carbon dioxide levels in Hawaii, 552
 Carbon emissions, 76
 Daylight hours, 550–551, 564, 599, 604–605, 611, 644
 Depth of a lake, 12
 Earthquakes, 436
 Global warming, 75, 477
 Going green, 44, 53
 Greenhouse effect, 418–419, 437, 476
 Indoor air pollution, 131
 Location of a forest fire, 650–651
 Methane emissions, 384, 385
 Modeling ocean temperatures, 252, 361
 Modeling sunrise times, 145
 Modeling sunset times, 139
 Modeling tides, 546–547, 551
 Ocean temperatures, 551, 552
 Reducing carbon emissions, 459
 Rise in sea level, 400–401
 River current, 749

Salinity of the oceans, 458
 Shortest day, 565
 Solid waste, 117
 Trout and pollution, 351
 Urban heat island, 382–383
 UV radiation, 376
 Water pollution, 164, 300
 Water usage, 9
 Wood in a tree, 743–744

FINANCE

ATM, 92, 932
 Account balance, 407
 Annuity, 418, 892–893
 Compound interest, 406–408, 414, 417, 418, 420, 459, 471, 474, 727, 943
 Continuous compound interest, 408–410, 415, 417, 418, 420, 437, 459, 471, 474
 Credit card debt, 246, 457
 Doubling time, 418
 Future value of an annuity, 893, 900
 Interest rates, 462
 Investment, 129, 418, 435, 459, 749, 769, 785–786, 874
 Present value of a savings account, 420
 Saving for retirement, 418
 Savings account, 398
 Value of an account, 416
 VISA cards, 145

GENERAL INTEREST

Animals and trotting speeds, 361
 Archeology, 164–165
 Birthdays, 906, 910
 Chicken consumption, 167
 Codes, 831
 Coffee cooling, 451–452
 Comparing ages, 165
 Converting units, 382, 383, 386, 399, 400, 476
 Counting strings, 909
 Distance between a ship and a rock, 668
 Dog years, 300
 Draining and filling a tank or pool, 67, 80, 90–91, 122, 275–276
 Error in measurements, 156
 Error tolerances, 145
 Fan speed, 490, 571
 Filters, 420, 900
 Flower samples, 911
 Hat size, 130–131

Height and shoe size, 95
 Height of a child, 50
 Height of a helicopter, 657
 Height of a hot-air balloon, 657
 Height of a mountain, 503
 Height of a structure, 502, 658
 Height of a tree, 502, 571
 Home ownership rates, 145
 House temperature, 184
 Landscaping formula, 565
 Length of lines, 321, 337, 338
 Maximizing storage, 762
 Mixing candy, 129, 728
 Modeling motion, 239
 Music and pure tones, 612, 644
 Musical tones and beats, 618–619, 623, 639, 644
 Number of coins, 746
 Number of handshakes, 922
 Obstructed view, 666, 724
 Painting, 668
 Peach samples, 911
 Pumping water, 129, 157, 785
 Puzzle, 165
 Ring size, 130
 Safe distance for a tree, 571
 Search party looking for an injured hiker, 660–661
 Searchlight, 858, 872
 Shadow length, 129, 502, 522, 536, 576, 729, 946
 Stacking logs, 900
 Swimming pools, 82–83, 92, 365, 383, 419
 Thickness of foil, 7–8, 11
 Throwing a stone, 185
 Time conversion, 378
 Time spent in line, 322, 337, 338, 361
 Touch-tone phones, 634–635, 639
 Water in a tank, 51–52, 66, 110, 166
 Water passing through a pipe, 475

GEOGRAPHY

Depth of oceans, 28
 Discharge of water, 11
 Highest continental elevations, 25
 Largest freshwater lakes, 25
 Movement of the Pacific plate, 11

GEOMETRY

Angle in a parallelogram, 667
 Angle of depression, 502

Angle of elevation, 563, 564, 571, 576, 729, 946
 Angles of a triangle, 769
 Area of a(n)
 equilateral triangle, 505
 hexagon, 505
 lot, 664, 667, 668, 669, 724
 parallelogram, 820
 rectangle, 285
 regular polygon, 668
 square, 886, 900
 triangle, 829
 Area of the Bermuda Triangle, 669
 Circular wave, 383, 384
 Circumference of a can, 145
 Conical water tank, 129
 Diagonals of a parallelogram, 667
 Diameter of a can, 150
 Dimensions of a
 box, 197–198, 299, 325–327, 337, 748, 749
 cone, 129
 cylinder, 742, 748, 829
 rectangular region, 130, 164, 190, 202, 204, 220, 246, 365, 746, 829, 946
 Equilateral triangle, 25, 131, 384
 Height of a pyramid, 503
 Isosceles triangle, 25
 Length of a side of a cube, 338
 Lengths of the sides of a triangle, 769
 Maximizing area, 178, 185, 202, 246, 749
 Minimizing surface area, 260, 337, 361, 366
 Perimeter of a(n)
 ellipse, 857
 rectangular region, 130, 145
 square, 900
 Radius of a
 can, 202, 220, 339
 circular region, 55
 Sides of a polygon, 922
 Similar rectangles, 131
 Surface area of a
 balloon, 384
 cone, 384
 sphere, 385
 Volume of a
 balloon, 576
 cone, 12
 cylinder, 167, 339, 748

soda can, 7, 12
 sphere, 12, 385, 399
 tree, 750

GOVERNMENT

Counterfeit money, 43
 Federal debt, 10, 11, 418, 830
 Social security, 468
 Toll of war, 749
 Voter turnout, 829
 Women in politics, 131

HEALTH AND MEDICINE

AIDS deaths, 202, 220, 238, 898
 AIDS in the U.S., 170, 184, 186, 202, 385, 397, 933
 Americans and weight, 366
 Antibiotic resistance, 940–941
 Asbestos and cancer, 464–465
 Back stress, 617–618, 622, 644
 Blood pressure, 808–809
 Caloric intake, 453, 458
 Carbon monoxide exposure, 220
 Chronic health care, 786
 Crutch length, 37, 45, 390–391
 Diseases, 935
 Drug concentrations, 322, 418, 459
 Energy produced by the human body, 4
 Epidemics, 476
 Health care cost, 366
 Heart disease, 113, 466, 467
 Heart rate, 186, 194–195, 220, 221, 750
 Height and weight, 352, 400, 749, 751, 760
 HIV infections, 91
 Injecting dye into the bloodstream, 469
 Injury rate, 90
 Lithotripter, 848, 856
 Lung cancer, 121
 Malpractice awards, 237
 Medicare costs, 162
 Minimum weight for a person, 168
 Nanotechnology, 11
 Organ transplants, 449–450, 457, 458, 924, 932
 Size of a typical virus, 4
 Skin cancer, 129, 376–377, 382
 Smallpox vaccinations, 749
 Threshold for ear pain, 424
 Volume of air in a person's lungs, 251

LABOR

Average wages, 111
 Calculating work, 678–680, 684, 686,
 723, 724, 729
 Hourly pay rate, 104
 Hours worked and pay, 158
 Income, 128
 Job offer, 415
 Median income, 54, 162
 Per capita income, 168
 Salary, 416, 438, 878, 880–881, 886,
 887, 890, 899
 Vacation days, 781
 Wages, 47
 Wal-mart employees, 203, 231–232, 352
 Women in the work force, 203–204
 Working together, 122–123, 129, 163,
 167, 365, 575, 945

PHYSICS

Bouncing ball, 886, 901, 946
 Distance an object falls, 575
 Electromagnets, 593, 598, 644
 Falling object, 14, 66, 90, 191, 203, 361,
 385, 940
 Floating ball, 290, 299
 Force of friction, 112
 Frequency of a vibrating string, 340
 Gravity, 339, 575, 729
 Height of a projectile, 184, 185,
 196–197, 203, 246, 260, 397, 401,
 940, 945
 Hooke's law, 104, 112
 Intensity of light, 328, 590
 Large Hadron Collider, 646
 Light absorption, 446, 457
 Low tones and small speakers, 645
 Modeling a pendulum, 327
 Modeling water flow, 221, 275
 Object lifted and dropped, 275
 Oscillating spring, 590, 598
 Piano string vibrations, 644–645
 Projectile flight, 537
 Pulleys, 490
 Resultant force, 723
 Simple harmonic motion, 544–545
 Snell's Law, 565
 Sound detection, 868
 Sound levels in decibels, 424, 435, 441,
 446, 459
 Sound waves, 622–623
 Speed of light, 4

Springs, 552
 Stone thrown into the air, 271
 Thickness of an oil film, 11
 Wavelength of visible light, 10
 Whispering gallery, 856

SOCIAL ISSUES

Aging in America, 275
 Deaths on school grounds, 109
 Food shelters, 780–781, 785
 Household size, 186–187
 Marijuana use and high school seniors,
 275
 Robberies, 749
 State and federal inmates, 25
 U.S. home ownership, 238

SPORTS

Athlete's heart rate, 170, 179–180,
 188
 Baseball diamond dimensions, 9
 Baseball positions, 910
 Basketball winning team, 932
 Batting orders, 910
 Bicycle riders not wearing helmets, 121
 Bicycle speed, 729
 Biking, 109
 Club speed in golf, 490
 Cost of skiing, 89
 Flight of a baseball, 170, 178–179, 185,
 692, 696
 Flight of a golf ball, 691, 696, 724, 729
 Force and water-ski towropes, 673, 685
 Height of a baseball, 202, 204
 Height of a golf ball, 33
 Hitting a baseball, 185
 Hitting a golf ball, 185
 Introducing basketball players, 910
 Olympic times, 25
 Optimum projection angle for a shot-
 putter, 555, 564
 Racehorse, 62–63, 67, 945
 Running, 55, 89, 123, 129, 163, 167,
 270–271, 365, 945
 Shooting a foul shot in basketball, 169,
 246–247
 Skateboard wheel, 490
 Swimming in a current, 672–673, 684
 Tennis, 479, 485, 490, 906
 Tickets to a baseball game, 769
 Volleyball serve, 934
 Walking, 55, 900

STATISTICS AND PROBABILITY

Drawing a card, 924, 927–928,
 929–930, 931, 932, 933, 934, 935,
 940, 945
 Drawing a number at random, 945
 Drawing marbles, 934, 940, 946
 Drawing the winning ball, 322
 Entrance exams, 933
 Garage door code, 934
 Human eye color, 925
 Lottery, 934
 New books published, 933
 Pizza toppings, 932
 Poker hands, 928, 932
 Polygraph test, 930–931
 Probability of organ transplants, 924
 Rolling dice, 927, 929, 931, 932, 933,
 934, 935, 939, 940, 945
 Tossing a coin, 929, 931, 932, 933, 935,
 939
 Unfair coin, 934
 Unfair die, 933
 Venn diagram, 940

TRANSPORTATION

Air safety inspectors, 109
 Air speed, 749
 Airline passengers, 86–87
 Airline tickets, 203, 365, 946
 Airplane navigation, 658, 667, 677, 684,
 685, 686, 724
 Airspeed and groundspeed, 685
 Bicycle, 576, 946
 Bicycle chain drive, 491
 Coordinates of an airplane, 521
 Course and groundspeed, 685
 Direction and speed of a boat, 724
 Distance, 60, 63, 73, 89, 109, 144, 163,
 167, 365, 656, 667, 728, 729, 945
 Distance between a car and the Texas
 border, 46–47
 Distance between a ship and a sub-
 marine, 668
 Distance between airports, 667
 Distance between cars, 17, 25, 73, 74,
 144
 Distance between cities, 484, 490, 571
 Distance between two boats or ships, 25,
 667, 668
 Distance from home, 92–93, 113, 163,
 167, 351, 945
 Height of an airplane, 724

Locating a ship, 656, 658
 Location of an airplane, 232–233
 Midair near collisions, 458
 Minimizing time, 260
 Nautical miles, 490
 Passenger travel, 94–95
 Plane speed, 749
 Runway length, 435, 436, 446
 Safe runway speed, 203
 Ship navigation, 667, 668
 Slippery roads, 322, 338
 Speed limits, 91–92, 150, 156
 Speed of a bicycle, 490
 Speed of a propeller, 491
 Time and distance, 14
 Time and speed, 50
 Traffic control, 760
 Traffic flow, 412, 419, 437, 459, 786, 813
 Traffic intensity, 309–310, 321
 Train curves, 322
 Trains and horsepower, 420
 Velocity of a bike ride, 362
 Velocity of a train, 54

U.S. AND WORLD DEMOGRAPHICS

Age in the U.S., 54
 Asian-American population, 27, 111
 Birth rate, 91, 259
 Death rates, 733
 Life expectancy, 25
 Marriage rates, 55
 Median age, 128
 Population density, 90, 128, 144
 Population estimates, 163

Trigonometric Functions and Identities

Right Triangle Trigonometry

$$\sin \theta = \frac{\text{side opposite}}{\text{hypotenuse}}$$

$$\cos \theta = \frac{\text{side adjacent}}{\text{hypotenuse}}$$

$$\csc \theta = \frac{\text{hypotenuse}}{\text{side opposite}}$$

$$\sec \theta = \frac{\text{hypotenuse}}{\text{side adjacent}}$$

$$\tan \theta = \frac{\text{side opposite}}{\text{side adjacent}}$$

$$\cot \theta = \frac{\text{side adjacent}}{\text{side opposite}}$$

The Unit Circle

$$\sin t = y$$

$$\cos t = x$$

$$\tan t = \frac{y}{x}$$

$$\csc t = \frac{1}{y}$$

$$\sec t = \frac{1}{x}$$

$$\cot t = \frac{x}{y}$$

The Unit Circle and Special Angles

Pythagorean

$$\sin^2 \theta + \cos^2 \theta = 1$$

$$1 + \tan^2 \theta = \sec^2 \theta$$

$$1 + \cot^2 \theta = \csc^2 \theta$$

Sum and Difference

$$\cos(\alpha + \beta) = \cos \alpha \cos \beta - \sin \alpha \sin \beta$$

$$\cos(\alpha - \beta) = \cos \alpha \cos \beta + \sin \alpha \sin \beta$$

$$\sin(\alpha + \beta) = \sin \alpha \cos \beta + \cos \alpha \sin \beta$$

$$\sin(\alpha - \beta) = \sin \alpha \cos \beta - \cos \alpha \sin \beta$$

$$\tan(\alpha + \beta) = \frac{\tan \alpha + \tan \beta}{1 - \tan \alpha \tan \beta}$$

$$\tan(\alpha - \beta) = \frac{\tan \alpha - \tan \beta}{1 + \tan \alpha \tan \beta}$$

Reciprocal

$$\sin \theta = \frac{1}{\csc \theta} \quad \cos \theta = \frac{1}{\sec \theta} \quad \tan \theta = \frac{1}{\cot \theta}$$

$$\csc \theta = \frac{1}{\sin \theta} \quad \sec \theta = \frac{1}{\cos \theta} \quad \cot \theta = \frac{1}{\tan \theta}$$

Quotient

$$\tan \theta = \frac{\sin \theta}{\cos \theta} \quad \cot \theta = \frac{\cos \theta}{\sin \theta}$$

Negative-Angle

$$\sin(-\theta) = -\sin \theta \quad \csc(-\theta) = -\csc \theta$$

$$\cos(-\theta) = \cos \theta \quad \sec(-\theta) = \sec \theta$$

$$\tan(-\theta) = -\tan \theta \quad \cot(-\theta) = -\cot \theta$$

Double-Angle

$$\sin 2\theta = 2 \sin \theta \cos \theta$$

$$\cos 2\theta = \cos^2 \theta - \sin^2 \theta$$

$$= 2 \cos^2 \theta - 1$$

$$= 1 - 2 \sin^2 \theta$$

$$\tan 2\theta = \frac{2 \tan \theta}{1 - \tan^2 \theta}$$

Power-Reducing

$$\sin^2 \theta = \frac{1 - \cos 2\theta}{2}$$

$$\cos^2 \theta = \frac{1 + \cos 2\theta}{2}$$

$$\tan^2 \theta = \frac{1 - \cos 2\theta}{1 + \cos 2\theta}$$

Half-Angle

$$\sin \frac{\theta}{2} = \pm \sqrt{\frac{1 - \cos \theta}{2}}$$

$$\cos \frac{\theta}{2} = \pm \sqrt{\frac{1 + \cos \theta}{2}}$$

$$\tan \frac{\theta}{2} = \frac{1 - \cos \theta}{\sin \theta}$$

$$\tan \frac{\theta}{2} = \frac{\sin \theta}{1 + \cos \theta}$$

Formulas from Geometry

Rectangle

$$A = LW$$

$$P = 2L + 2W$$

Pythagorean Theorem

$$c^2 = a^2 + b^2$$

Equilateral Triangle

$$A = \frac{\sqrt{3}}{4} s^2$$

$$P = 3s$$

Trapezoid

$$A = \frac{1}{2}(a + b)h$$

$$P = a + b + c + d$$

Sum of the Angles in a Triangle

$$A + B + C = 180^\circ$$

Triangle

$$A = \frac{1}{2}bh$$

$$P = a + b + c$$

Circle

$$C = 2\pi r$$

$$A = \pi r^2$$

Parallelogram

$$A = bh$$

$$P = 2a + 2b$$

Ellipse

$$A = \pi ab$$

$$P \approx 2\pi \sqrt{\frac{a^2 + b^2}{2}}$$

Sum of the Angles in a Quadrangle

$$A + B + C + D = 360^\circ$$

Rectangular (Parallelepiped) Box

$$V = LWH$$

$$S = 2LW + 2LH + 2WH$$

Cylinder

$$V = \pi r^2 h$$

$$S = 2\pi rh + 2\pi r^2$$

Sphere

$$V = \frac{4}{3}\pi r^3$$

$$S = 4\pi r^2$$

Cone

$$V = \frac{1}{3}\pi r^2 h$$

$$S = \pi r^2 + \pi r \sqrt{r^2 + h^2}$$

Formulas from Algebra

Basic Properties

$$a + b = b + a$$

$$ab = ba$$

$$(a + b) + c = a + (b + c)$$

$$(ab)c = a(bc)$$

$$a(b + c) = ab + ac$$

$$\frac{a}{c} + \frac{b}{c} = \frac{a + b}{c}$$

$$\frac{a}{b} \times \frac{c}{d} = \frac{ac}{bd}$$

Radicals

$$a^{1/n} = \sqrt[n]{a}$$

$$a^{m/n} = \sqrt[n]{a^m}$$

$$a^{m/n} = (\sqrt[n]{a})^m$$

$$\sqrt[n]{ab} = \sqrt[n]{a} \cdot \sqrt[n]{b}$$

$$\sqrt[n]{\frac{a}{b}} = \frac{\sqrt[n]{a}}{\sqrt[n]{b}}$$

Distance Formula

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

Slope of a Line

$$m = \frac{\Delta y}{\Delta x} = \frac{y_2 - y_1}{x_2 - x_1}$$

Point-Slope Form

$$y = m(x - x_1) + y_1$$

$$y - y_1 = m(x - x_1)$$

Vertex Formula

$$x = -\frac{b}{2a}$$

Exponents

$$a^m a^n = a^{m+n}$$

$$(a^m)^n = a^{mn}$$

$$(ab)^n = a^n b^n$$

$$\left(\frac{a}{b}\right)^n = \frac{a^n}{b^n}$$

$$\frac{a^m}{a^n} = a^{m-n}$$

$$a^{-n} = \frac{1}{a^n}$$

$$\frac{a^{-m}}{a^{-n}} = \frac{a^n}{a^m}$$

$$\left(\frac{a}{b}\right)^{-n} = \left(\frac{b}{a}\right)^n$$

Special Factoring

$$a^2 - b^2 = (a - b)(a + b)$$

$$a^2 + 2ab + b^2 = (a + b)^2$$

$$a^2 - 2ab + b^2 = (a - b)^2$$

$$a^3 + b^3 = (a + b)(a^2 - ab + b^2)$$

$$a^3 - b^3 = (a - b)(a^2 + ab + b^2)$$

Midpoint Formula

$$M = \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$$

Average Rate of Change of f from x_1 to x_2

$$\frac{y_2 - y_1}{x_2 - x_1} \quad \text{or} \quad \frac{f(x_2) - f(x_1)}{x_2 - x_1}$$

Horizontal Line

$$y = b$$

Vertex (Standard) Form

$$y = a(x - h)^2 + k$$

Logarithms

$$\log_a x = k \quad \text{means} \quad x = a^k$$

$$\log_a 1 = 0 \quad \text{and} \quad \log_a a = 1$$

$$\log_a m + \log_a n = \log_a mn$$

$$\log_a m - \log_a n = \log_a \frac{m}{n}$$

$$\log_a m^r = r \log_a m$$

$$\log_a a^x = x$$

$$a^{\log_a x} = x$$

$$\log_a x = \frac{\log_b x}{\log_b a} \quad (\text{change of base})$$

Constants

$$\pi \approx 3.141593$$

$$e \approx 2.718282$$

$$i = \sqrt{-1}$$

$$i^2 = -1$$

Quadratic Formula

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

Slope-Intercept Form

$$y = mx + b$$

Vertical Line

$$x = k$$

Standard Equation of a Circle

$$(x - h)^2 + (y - k)^2 = r^2$$
